The excessive emphasis upon nervous degeneracy and its role in the genesis of the neuroses brings with it a tendency not to investigate with the necessary rigour the different ways in which hysteria manifests itself. Our therapeutic measures also are not apt to make it worthwhile to distinguish between hysteria and neurasthenia: favourable external circumstances, rest and fortification pass as therapy for both conditions.

It is not impossible, however, that our quest for a clearer determination of the [nosological] boundaries will achieve results that will point the therapeutic treatments in a more specific direction.

Is it permissible, on grounds of the coexistence of hysterical and neurasthenic symptoms in a single clinical picture, to conclude that the two diseases share a common root? Internal medicine revealed a symbiosis between carriers of infection which is analogous to the combination of hysterical and neurasthenic symptoms. One sees pure, unadulterated types most frequently at the onset of a neurosis, i.e. in youthful patients.

Neurasthenic symptoms usually follow a long-standing hysteria. The development of hysteria on a neurasthenic base is more uncommon.

The question of the aetiology of the neuroses is not settled by reference to hereditary conditions. Impartial observation and careful anamnestic enquiry lead us more securely to the origins of the disease and simultaneously allow us to establish points of departure for a prophylactic therapy.

Moreover, stricter delimitation of the concepts of hysteria and neurasthenia secures the prognosis, which is to be regarded as unfavourable only in true neurasthenia.

The following is an attempt at a classification of the neuroses: (1) hysteria; (2) neurasthenia in a stricter sense; (3) obsessional neurosis; (4) anxiety neurosis. (Other clinical forms of so-called neurasthenia, which are of no use for the purposes of this study, are left out of consideration here.) Thus, what was previously called neurasthenia dissolves into neurasthenia *sensu strictiori*, obsessional neurosis and anxiety neurosis. Each entity, in accordance with the disparity in the symptoms, reveals a different aetiology.

Westphal [1877] refers to the occurrence of 'neurasthenic obsessional ideas' and interprets them as symptoms of degeneracy.[1] Others detach them from neurasthenia. Clinical findings well justify our taking the latter approach. Obsessional ideas can exist without any neurasthenic adjunct, and where they do accompany neurasthenic symptoms, they differ from them in duration and intensity. Indeed, even in hysteria one occasionally comes across obsessional ideas.[2]

The following are recognized as being manifestations of neurasthenia: weakness, deficient nervous capacity, dyspepsia, spastic constipation, headache and backache. However, among so-called neurasthenics one often comes across another, sharply contrasting type characterized by: distress, agitation, restlessness, sensitivity of hearing, anxiety in all forms (anxiety following an acute or a chronic course, anxiety as a concomitant of paraesthesia) accompanied by palpitations, sleep disturbances and convulsions. It is important in individual cases to uncover the masked anxiety. There are patients who are treated for dyspnoea, arrhythmia, voracity or convulsions, until careful investigation reveals that these states are accompaniments of an anxiety neurosis. Hecker [1893] speaks

1 [Westphal (1877) had published a detailed descriptive classification of obsessional ideas (see *RSE*, **1**, 12 *n.* 3). In the *Studies on Hysteria*, Freud refers to his attempt to treat 'genuine obsessional ideas of the Westphal type' and explains that these are cases 'without a single trait which recalled hysteria' (p. 228 above).]

2 [This part of the lecture is reported somewhat differently in the *Presse* version, which seems likely to be more accurate (see p. 302 below).]

of such cases as representing rudiments or equivalents of anxiety attacks.[1] Weakness and cranial pressure are often absent, and instead of the intestinal inertia, accelerated peristalsis is found. We are therefore entitled to separate the neurosis [just described] from neurasthenia.[2] In old textbooks this clinical entity is dealt with under the heading of hypochondria, a designation which is unacceptable for anxiety neurosis for just this reason, because it is identified with the concept of 'fear of illness' and therefore seems to be too narrowly framed.

Investigation of the aetiology of true neurasthenia and anxiety neurosis almost invariably leads to noxae arising from sexual life. In both men and women masturbation almost always lies at the root of true neurasthenia. Where this aetiological factor is absent, heredity – which expresses itself in premature and abundant sexual discharges and pollutions – can be demonstrated.

In previously healthy men anxiety neurosis is rooted in abstinence. Where strong sexual excitement is not satisfied at all, or only through looking and touching,[3] this anxiety neurosis readily develops. Women usually fall victim to it through *coitus interruptus*.[4] The detachment of anxiety neurosis from true neurasthenia is therefore necessitated not only by the symptomatology but also by the aetiology; true neurasthenia results from an overabundant sexual discharge, anxiety neurosis[5] from an accumulation of the sexual products.

This aetiology holds good for all extreme, pure cases. It was successfully demonstrated in 80 per cent of the cases investigated [by Freud]. If one considers the difficulties inherent in such an investigation, the remaining 20 per cent of cases appear to be well accounted for.

In comparison with these causes, the aetiological factors usually cited – those drawn from cultural life [*Kulturleben*][T] – pale in significance. The sexual noxae are specific pathological irritants and give the neurosis direction and purpose. But nervous toxins, emotions, overwork and uncertainty regarding income play a preparatory or ancillary role. *Kultur*

1 [Cf. the opening of Freud's paper on anxiety neurosis (1895*b*), where Hecker's paper is described (*RSE*, **3**, 82 and 84 f.). The work was mentioned again in the second paper on anxiety neurosis (Freud, 1895*f*), ibid., **3**, 109, and in *Studies on Hysteria*, p. 229 above. In all three places Freud acknowledges the fact that Hecker had anticipated him.]

2 [This was the theme of Freud's own paper (1895*b*).]

3 [Freud intends to include the perversions in this context, as is made clearer in the *Presse* version.]

4 [In the *Presse* version, abstinence due to widowhood is mentioned as an equally important cause of anxiety neurosis.]

5 ['*Zwangsneurose*' ('obsessional neurosis') in the German original, which is obviously incorrect.]

They determine the severity of the neurosis. Not everyone who pursues the wrong path in sexual life acquires a neurosis. The noxae contributed by our civilization [*Kultur*] play a supportive role here and can render the [specific] noxa significant enough. And children who succumb to overwork at school become masturbators and polluters.

One seldom comes across hysteria in a pure form. It is usually cast within a symptom complex in an amalgam of neuroses. The examination of this subject verges on the psychological realm, from which one remains distant in an investigation of the other [actual] neuroses with their physiological, somatic character. Only obsessional ideas have a similar internal structure [to hysteria], and they are equivalent to hysteria with respect to therapeutic results too.

Continued – Session on October 21, 1895

In the symptom complex of a neurotic disease the hysterical element is distinguished by a well-defined psychical mechanism.[1] Every hysteria has a 'repression' [*Verdrängung*][T] at its base. The process of hysterical repression has an equivalent in the sphere of the normal, and is easily understood there.

One seeks to repress ideas [*Vorstellungen*][T] which evoke unpleasant thought associations. [For example:] It is not a matter of indifference whether an examiner takes an unfamiliar person or someone close to us as the subject of a question in a Forensic Medicine examination.[2] In the latter case, the content of our phantasy becomes distressing. The feeling of unpleasure [*Unlustgefühl*][T] grows still more if impulses touching on embarrassing memories of a real event arise out of the exchange. One seeks to fend off feelings of unpleasure of this sort. The struggle to prevent the arousal of uncomfortable ideas is documented in some such words as, 'I shudder when I hear about that'; 'Let's rather not talk about that'. A lady of good society, who had once found herself in a compromised position, would rightly look upon any conversational recollection of her previous situation as a rude violation of social responsibilities and would indignantly decline discussion of the matter. She would also avoid the theatre where she once performed if she is unpleasantly affected by the recollection of that period. She tries to forget the compromising situation, to repress ideas concerning it, and utilizes her

Unlust

1 [At this point, Freud specifically mentioned Breuer's theoretical contribution to *Studies on Hysteria*. Cf. the *Presse* version, p. 304 and *n.* 2 below.]

2 [The obscurity of this example is clarified with reference to an unpleasant experience of Freud's own during a Forensic Medicine examination; see (1900*a*), *RSE*, **4**, 244, and (1989*f*), ibid., **5**, 567.]

command over her train of thought in such a way that she avoids opportunities for such stimuli. Ever cautious, constantly erecting defences [*Abwehr*][T], she eventually achieves virtuosity in the repression of her embarrassing memory.

How does the analogous repression in hysteria come about? The following principal groups can be distinguished among hysterical symptoms: (1) Perceptual residues. These appear in consciousness as reminiscences. The person suffers from a hallucination which spontaneously recurs, pushing itself powerfully to the forefront of consciousness. Hysterical pains could also be interpreted as representatives of this group. (2) Motor discharges [*Entladungen*][T]. Such are weeping, fits of laughter, convulsions, etc. (3) Complicated psychical formations [*Bildungen*][T], ideational complexes, tendencies [*Tendenzen*],[1] abulia. The most multifarious interconnections exist between these groups. A person, for example, becomes aware of an olfactory hallucination and simultaneously becomes sad.[2] She sees an apparition which evokes the idea in her that she should jump out of the window. The idea surfaces that something has happened to a beloved person, and with that, feelings of anxiety occur. If a hysterical person is compelled to eat in spite of her counterwill [*Widerwillens*], one witnesses an expression of affect: the patient vomits. If one tries to force her to walk, a hysterical attack ensues. As one element from one group of symptoms sets in, symptoms from the other groups necessarily follow; it is a mechanism which inexorably runs its course and in which the will plays no part. Hysterical ideas are excessively intense [*überstark*], but they are isolated in the sphere of consciousness and are [therefore] not understood. The hysterical person cannot eat, or cannot walk, but she is unaware of the grounds for her conduct. Where a hysterical compulsion of this sort exists, repression has taken place; the person who cannot eat for reasons of disgust has repressed a distressing memory.

If one attempts to expose this memory, one comes up against an enormous resistance [*widerstand*]. The patient behaves towards the source of her unpleasure just as her normal counterpart did, the abovementioned lady of good society. Hysterical repression differs from the normal in quantitative terms only.

By means of Breuer's method of investigation one is in a position to extract the repressed memories and to lay bare their interconnections with the perceptual residue. One then sees, for example, that the counterwill against food and drink arises out of a decisive refusal to

1 [In the *Presse* version, this is qualified as 'inclinations to do something'.]

2 [See the further details below (p. 296 and *n.* 2), which reveal the identity of this patient.]

remember family mealtimes, where strife and discord once prevailed and disagreements were aired.[1] Thus one grasps [for example] the relationship between an olfactory tobacco hallucination and the feeling of melancholy, where one learns that the idea of cigar smoke was once linked to a disappointed hope.[2]

Perusal of the causal, distressing impressions shows that they invariably have a sexual content. And the sexual factor is precisely what physicians have hitherto underestimated. One examines the functions of all organs, but in regard to the sexual apparatus alone one timidly avoids asking any questions.

How does a hysterical symptom develop out of a repression? Here, one would think, the analogy from normal life forsakes us. In fact, a trace of similarity still remains. Our lady of the refined world has the strongest opinions when the subject of respectability is addressed in company. Whoever changed his faith, is of dubious nationality, or is of recent ennoblement, is [in the opinion of this lady] not devout enough, not nationally minded enough and not aristocratic enough. They have the strictest principles and emphasize most vigorously their dislike of dissenters. Their fundamentalism becomes explicable, however, when one learns that they use it to repress distressing memories.

The intensely charged perceptual residues of hysteria develop in similar fashion. Obsessional neurosis, which is very close to hysteria and coincides with it in many respects, illustrates the genesis and structure of these characteristic hyperaesthesias more clearly. Consider the following case. A man heard in a lecture by Leidesdorf[3] what aggressive actions can occur in post-epileptic twilight states. Soon thereafter the anxiety is aroused in him that one day he, too, may find himself in a state like that, and may harm someone without knowing it. From his past history: he once suffered from a sense of guilt for having taken too much money from a debtor and, on another occasion, for having underpaid a waiter. Here the tendency to self-accusation is a constant. In this patient one finds a thoroughgoing, suppressed sense of guilt, which certainly once had its origins in reality. The real root has been lost and the existing thought connections are absurd. This is also apparent to the patient

1 [Cf. the case of 'Nina R.', who suffered from hysterical anorexia, p. 279 and *n*. 2 above.]

2 [This is almost certainly an allusion to Freud's patient, Miss Lucy R., in *Studies on Hysteria*.]

3 [Maximilian Leidesdorf, author of an influential textbook of psychiatry (1865), had lectured on neurology and psychiatry for over thirty years before he was succeeded in his clinic by Krafft-Ebing. The patient described above does not seem to match up with any of Freud's published case histories. A few days after giving the present lecture, however, in a letter dated October 31, 1895, Freud wrote to Fliess about a patient, who 'does not dare go out into the street because of homicidal tendencies' (Freud, 1950*a*, Letter 33).]

himself, but he only succeeds in letting go of his obsessional ideas after a protracted period.

Investigation of hysteria shows: The affective disposition is demonstrably linked to realistic guilt. The person seeks to repress the distressing memory. This is successful, but the sense of guilt thereby becomes excessive and the idea that something terrible has happened recurs. Thus the person comes to have a pure, accentuated sense of guilt without remembering the [corresponding] deed.

If some event brings forth the possibility of guilt, then the hyperaesthetic sense of guilt immediately surges powerfully upwards and acquires particular features under the influence of this new event. Presently the person comes to be dominated by his first, fateful feeling of guilt, and falls under the influence of a guilt 'surrogate'.

Surrogate formations are also not unknown in normal life. They appear in various forms: where bachelors collect snuff-boxes and where old maids caress cats and dogs; and likewise, ardent religiosity is frequently a surrogate for ardent love.

The following example illustrates how the sense of guilt comes to be accentuated, and the hysterical compulsion [*Zwang*] thereby established through repression. A girl burdened by sexual guilt is seized by the fear of giving herself away by blushing. She represses her [sexual] memory – and the accent falls on the blushing. Simultaneously with the apparently unmotivated compulsive blushing, the uncanny feeling surfaces that people know something about her.[1] If she succeeds in giving up the blushing altogether, the feeling that others consider her to be guilty intensifies. With each repression she thus encumbers the following link in the hysterical chain with hysterical compulsion.

Conclusion – Session on October 28, 1895

Every link in the chain – which is so important for the structure of the obsessional neurosis – is fixed in the sphere of consciousness with a particular intensity.[2] As the feeling of unpleasure forces the distressing memory to be repressed, the next link inherits its intensity; the psychical emphasis shifts from the repressed memory to the sense of guilt. The subject is now in a position to connect each more or less suitable event to

1 [This case is omitted from the *Presse* version. However, in the corresponding passage attention is drawn to the similarity of the mechanism of hysterical symptom-formation not only to that of obsessional ideas, but also to that of delusions of observation. Cf. p. 306 below.]

2 [The corresponding account in the *Presse* would seem to be a more faithful reflection of Freud's present argument.]

her hypertrophic sense of guilt and to encumber herself with thoughts or expectations of guilt. This process takes place in complicated fashion when the principal links in the hysterical chain are activated.

The foregoing explanation is open to the objection, above all, that it does not uncover the ultimate causes of hysteria. But it cannot legitimately be expected that diseases of the psyche be pursued beyond the reach of current psychological knowledge. The importance of the above-reported conception [*Auffassung*][T] of hysteria resides in the fact that it is now possible to grasp the development and interconnection of hysterical symptoms and thereby to obtain therapeutic benefits. The lessons of the future must connect with the similarity[1] between hysterical and dream ideation and with the unique disposition of childhood.

Hysterical repression far surpasses the boundaries of normal repression. It is excessive. Normally the repressed idea can be exposed – admittedly, only at the expense of a feeling of unpleasure – but in cases of hysteria it can be successfully reproduced only with the assistance of the physician. This quantitative distinction necessarily leads to the view that an unexplained hereditary or individual disposition is at work in the genesis of hysteria.

In obsessional neurosis [*Zwangsvorstellung*], compulsive symptom [*Zwangssymptom*] and repression set in at different times: each newly repressed event attaches itself to the previously existing sense of guilt. In hysteria, by contrast, event and symptom-formation go hand in hand.[2] [For example, in the previously described case:] Simultaneously with the causal event, an olfactory sensation occurred; after the repression, the attack expresses itself in the manner that the hysterical person becomes aware of a smell and is compelled to weep.

In hysteria one also finds a clear tendency to 'conversion', that is, the [repressed] ideas strive for the motor sphere, they tend towards discharge.[3] It is characteristic of obsessional rage [*Zwangswut*] to experience anxiety about inflicting something upon others. Those who are afflicted in this way avoid the opportunity of being alone with others. Should hysteria gain the upper hand here, the anxiety is expressed and discharged by screaming, ranting, chiding, rending – truly hysterical symptoms.

1 ['*Identität*', i.e. literally 'the *identity* of hysterical and dream ideation'. – This important point, which is missed in the *Presse* report, is also made in the 'Project', Part I, Sections 19 and 20; *RSE*, **1**, 361 and 366.]

2 [At this point in the *Presse* version, the concept and term 'hypnoid moments' are introduced. See p. 306 below.]

3 ['Conversion' is another important topic omitted from the *Presse* report.]

The causal event underlying an obsessional idea is easily disclosed. One acknowledges that the affect is justified and replaces the surrogate with a more appropriate idea. In hysteria one is in search of an episode that occurred simultaneously with the formation of the symptoms, which, by virtue of its character, had to be repressed. In the above case [for example]: an olfactory sensation and an idea which renders the weeping explicable were once contiguous in reality.

Diagnostic tools, the usefulness of which is usually exhausted by the identification of the disease, become a therapeutic tool in hysteria. While the physician works at bringing the repressed idea to awareness he helps the patient to reverse the repression. Moments before the physician uncovers the [traumatic] event, the patient's compulsion ceases and the excessive intensity attaching to the hysterical symptom passes back on to the idea of the event.

Now, in hysteria, we are concerned with hidden processes of mental life.[1] The patient just does not have the required idea at her disposal. Breuer therefore asks the patient to transpose herself back to the earlier moment,[2] to the moment when the symptom first appeared, and under hypnosis the patient finds her way from the current affect to the repressed idea.

Hypnosis can however be set aside. The patient is [instead] instructed to recall when, how and under what circumstances the symptom first appeared. Where the memory trace expires, there lies a region of ideas to which the patient will not direct her attention. One encourages the patient to explore further and declares that something will occur to her as soon as one presses on her forehead. Thus her full attention is directed towards that which is essential. Presently she reproduces the repressed idea, voluntarily or with resistance [*Gegenwehr*].[3]

The nature of the repression therefore consisted in the fact that the person was not in a position to direct her thoughts spontaneously to the idea concerned. When she approaches the vicinity of this circle of ideas she experiences a feeling of unpleasure, which is the reason why she will not explore any further. The mnemic images themselves are preserved, because otherwise her statement regarding them really would be impossible. The patient believes, however, that she cannot remember and does not know that she lacks the will to remember. She has a dual mental life:

1 ['*Vorgänge des Seelenlebens, die nicht zutage liegen*.']

2 [That is, the moment of repression – the 'hypnoid moment'. Cf. the *Presse* version (p. 306 below), which is altogether more precise in its rendering of this part of the lecture.]

3 [The *Presse* version is again better on the subject of pressure technique, mentioning that it was Freud's own innovation (p. 306 f. below).]

the one [part of her mind] is aware of the distressing idea, the other believes itself not to be in possession of the memory. Breuer has named this phenomenon 'splitting of mental activity'.[1]

The internal perceptions are no less incomplete and incorrect than the external ones. The hysteric, in particular, is a person whose consciousness represents a memory incompletely and incorrectly. The patient must be made aware of the massive resistance that she puts up when one approaches the repressed memory; she must recognize that she is not in possession of the reminiscence because she does not wish to surrender it.

This massive resistance during exploration for the original event readily misleads one. The patient clings to trivia and wants to remain there. She even breaks off the treatment and runs away from it, although she initially placed great trust in it. This bears witness to the massive unpleasure brought about by the directing of attention to the sought-after material and to the magnitude of the psychical force required [to overcome the resistance], a force equal to the force that first brought about the repression.[2]

The patient is tempted to invoke this psychical *redressement*, to give way to the resistance, if it offers a suitable escape route. This creates the impression of trying to expose a demon to the light, because it knows that that would be its end.

Considerable therapeutic success rewards the immense effort. It is always possible to exorcize the symptoms of the repression. Heavy demands are made on the intelligence and confidence of the patient. The treatment is protracted and the patient is expected to reveal secrets. Contra-indications do not exist.

Yet, is it not the case that the [underlying] disposition remains undiminished? During this work it is observed that patients do not put many repressions into effect; indeed, they seem to be quite out of the question after puberty. If new symptoms develop in later life they are attached to the previously repressed memories. A recurring unhealthy situation is repressed from recollection in the same way as before. If one then removes [*behebt*][3] the first repression, which is linked with the succession of numerous later symptoms, one has a chance of curing the [whole] hysteria.

1 ['*Spaltung der Seelentätigkeit*.' In *Studies on Hysteria*, Breuer's actual phrase was '*Spaltung der psychischen Tätigkeit*'. Cf. pp. 202 *n*. 1 and 204 above. Freud is here following Breuer in rejecting the term previously used by both of them, 'splitting of consciousness'.]

2 [This important point – which escaped the *Presse* reporter – is made very clearly in Part II, Section 2, of the 'Project'; *RSE*, **1**, 375 f. and 376 *n*. 1. Cf. also pp. 257 and 295 above.]

3 [Freud's usual term was '*aufhebt*' ('lifts').]

II. REPORT IN THE *WIENER MEDIZINISCHE PRESSE*[1]

Vienna College of Physicians

Scientific Meetings on October 14 and 21, 1895

An attempt to consider one or another question from the doctrine of hysteria comes up against more obstacles than would a discussion of any other clinical-pathological concept with a well-defined character. It proves to be practical, therefore, before going into the diagnosis of hysteria, first to discuss its differentiation from similar affections. Charcot and his school are to be credited with having drawn the distinction between hysteria and certain organic affections. Today the focal point of interest is the problem of differentiating hysteria from certain neuroses which, in their nature, are closely allied to it. Neurasthenia comes into consideration first of all. There apparently is no immediate advantage in discussing neurasthenia with a view to clarifying the nature of hysteria, for neurasthenia is currently a vague and indistinct concept. However, this consideration would disappear if a sharper definition could be achieved for neurasthenia, too. It is also justifiable to object, in accordance with the opinions of the most informed authors, that it appears as if these two neuroses can only be distinguished in their most extreme forms. It is true that clinical experience illustrates daily that neurasthenic and hysterical symptoms occur together quite frequently, but this does not in the least prevent a conceptual, and thus a diagnostic, separation of the two affections. In youthful cases one comes across every form of hysteria without a trace of neurasthenic admixture, and *vice versa*. Finally, regarding the question of whether such a detachment of hysteria from neurasthenia has any value from the therapeutic standpoint, it must be said that the current method of treatment pays too much heed to the fact of hereditary constitution and much too little to the clinical presentation of the neuroses. And yet, attentive study of the symptomatology provides one with very valuable information on the nature of the neuroses and, above all, on their aetiology. There is, in fact, a regular relation between the manner in which the 'nervousness' expresses itself and the aetiology, which, together with heredity, plays a part in the individual case. Thus, by paying attention to the symptomatology, one can draw direct conclusions about the aetiology, and thereby obtain valuable

1 [Links between this report and the *Rundschau* version are annotated above; the notes are not repeated here.]

hints for prophylaxis. This is important, for experience has shown that the curability of a particular symptom within a complex depends upon whether it is hysterical or neurasthenic in nature, insofar as a quite definite treatment removes hysterical symptoms but will absolutely not cure neurasthenic symptoms.

The following four types can be demarcated within the area that we call the neuroses: hysteria, neurasthenia in the strict sense, anxiety neurosis and the neurosis of obsessional ideas, or obsessional neurosis. What was previously known as neurasthenia now dissolves into neurasthenia *sensu strictiori*, obsessional neurosis and anxiety neurosis. The justification for this nomenclature lies in the observation that, within the variety of symptoms, a regular variety of aetiologies is recognizable. Obsessional ideas are partly referred to as symptoms of neurasthenia and partly detached from neurasthenia (as obsessional neurosis) and referred to as symptoms of degeneracy. The following facts support the view that obsessional neurosis has nothing at all to do with common neurasthenia: (1) a series of cases exists which display no signs of neurasthenia other than obsessional ideas; and (2) in those instances where neurasthenic [symptoms] and obsessional ideas occur together, the severity of the latter does not by any means correspond with that of the remaining neurasthenic symptoms. They look much more like a mixture. And, incidentally, obsessional ideas occur just as frequently in hysteria.

Anxiety neurosis, in contrast to neurasthenia, gives an impression of overexcitement. The person finds himself in a state of continual restlessness, excitable agitation and, above all, anxiety in all possible forms: acute anxiety (an attack suddenly descending upon the patient), and anxiety in chronic form (latent, waiting to attach itself to any incident). Besides these, there are paraesthesias, breathing difficulties, palpitations, congestion, perspiration, sleep disturbance, etc. The anxiety state is often masked by certain symptoms, such as malaise [*Unbehagen*], dyspnoea, cardiac disturbance, gastric phenomena, etc. During more severe attacks the anxiety clearly emerges. Hecker [1893] calls these phenomena rudiments or equivalents of the anxiety attack. In many respects, individual anxiety symptoms are actually opposite to those of neurasthenia, especially anxious diarrhoea (which is so often incorrectly diagnosed). What makes it particularly justifiable to single out this type of anxiety neurosis is the relative frequency with which it presents in completely pure form without any other trace of neurasthenic manifestation. Naturally, however, mixed cases are still always the most frequent. In the days when neurasthenia had not yet come to

the fore, this picture of anxiety neurosis formed the basis of the old concept of hypochondria.

It was said above that the regular symptomatic varieties correspond to a regular variety of aetiologies. The situation is as follows. In the study of typical, pure cases in youthful subjects, daily experience shows – both in genuine neurasthenia and in anxiety neurosis – that the aetiology involves noxae of sexual life. But these noxae are of a different nature in the two cases. That is, in true neurasthenia one always finds *masturbation* to be the cause – indeed, in women no less than in men – whereas if masturbation is not in evidence, one can easily establish that a *hereditary* affection of the nervous system is at issue – which expresses itself in exceptionally abundant and premature spontaneous sexual discharges and pollutions. Accordingly, one can schematically adopt two forms of neurasthenia, an acquired form: masturbation-neurasthenia; and an inherited form: pollution-neurasthenia. Now, as far as the aetiology of anxiety neurosis is concerned, sexual noxae are, in fact, again at issue; but these are of an entirely different character. In men, anxiety neurosis can be traced back to *abstinence* in the face of powerful libido. All forms of abnormal satisfaction, where strong sexual excitement is initiated but not discharged in the normal way, belong to this category too. In women the most common basis for anxiety neurosis apart from the abstinence occasioned by widowhood is *coitus interruptus*. Thus, while neurasthenia concerns the excessive expenditure of the sexual products, in anxiety neurosis a large part is played by the retention, the accrual as it were, of the sexual products.

With intensive observation and study of numerous instances, Freud found this aetiology in approximately 80 per cent of cases. It might be asked whether there is no place at all for the factors which are traditionally regarded as the causes of nervousness (civilization [*Zivilisation*], life in large cities, overwork at school, overexertion of our sense organs, accumulating and chasing after possessions, uncertain living conditions, the great catastrophes, nervous toxins – all of which overtax us). In reply, it must be said that these factors do indeed make no direct contribution to the aetiology of neurasthenia. The sexual noxae represent specific causes, that is, they cannot be absent if a particular neurosis is to arise. The most various noxae then certainly can contribute, as quantitative factors, to the formation of the neurosis. The sexual noxae thus give direction to the whole, but they are not

decisive. The decisive moment arrives when the stock causes influencing the subject reach a critical magnitude. A sexually normal person does not collapse under the influence of certain noxae, he does not acquire a neurosis, while on the other hand, these stock noxae do not have to be present at all if the sexual noxae alone are intensive and pervasive enough.

Following these principles, it is easy to recognize the pure forms of neurasthenia and anxiety neurosis, and to differentiate them from hysteria. We also recognize pure cases of hysteria by following the typical cases described by Charcot.[1] The remaining forms are mixed types – and it is just as unjustifiable to call them hysteria because they display hysterical phenomena as it is to call them neurasthenia because neurasthenic symptoms are present.

If one seeks to formulate a view [*Vorstellung*] of the mechanism of the neuroses, it can be claimed (in accordance with what has already been explained above) that neurasthenia and anxiety neurosis represent disorders of a purely somatic character, disturbances of a physiological nature approximating disorders of intoxication. There is no need for us to appeal to the psychical field. In hysteria, however, following the works of recent years, it can be accepted that the mechanism of the hysterical symptom complex is a psychological one, that is, that the disturbances of hysteria take place in the psychical field, that it is a psychical mechanism that is common to all hysterical symptoms. It is interesting that obsessional ideas have a very similar mechanism – and a quite specific, very successful therapy can be based on this.

The proof that hysteria actually concerns a psychical mechanism was only recently adduced by J. Breuer, in an essay entitled 'Theoretical on Hysteria'.[2] This psychical mechanism is a uniform one. That is, all hysterical manifestations arise from the psychical mechanism of hysterical or neurotic '*repression*'. In normal life, too, one seeks to forget events which are linked to unpleasant memories, to fend off the recollection of certain unpleasant things. This tendency is in operation when one puts aside all perceptions which could associatively revive the thoughts in question, or when one uses one's command over one's own train of thought to avoid everything which leads to the revival of this distressing

1 [Cf. Freud's account of this part of Charcot's work in the Paris Report (Freud, *1956a* [1886]), *RSE*, **1**, 11 and *n*., as well as his encyclopaedia article on hysteria (*1888b*), ibid., **1**, 43 ff. See also some comments on the role of the concept '*type*' in Charcot's nosography in Freud's Preface to his translation of Charcot's *Tuesday Lectures* (*1892–94a*), ibid., **1**, 162 f.]

2 [This 'essay' formed a chapter in the combined work by Breuer & Freud, *Studies on Hysteria*, p. 165 ff. above.]

idea. And by becoming ever more cautious, one achieves such virtuosity in repression and forgetting that the reminiscence in question no longer appears spontaneously in consciousness. Something very similar takes place in hysteria. The most important hysterical symptoms can be schematically divided into the following three groups: (1) reminiscences of hallucinatory intensity; (2) motor discharges (fits of crying, fits of laughter, convulsions); (3) inferences, tendencies (inclinations to do something) and abulias (incapacities, e.g. to eat, to walk, etc.). Of course, hysterical phenomena are not always so simple; these elements form combinations. For example, a patient does not simply become aware of a hallucinatory smell from time to time; rather, a certain smell makes it necessary for her to weep, to be sad, etc. All of these symptoms have in common the characteristic that the will plays absolutely no part in them – we are dealing with '*excessively strong* ideas'.

These ideas are always tainted by a compulsion [*Zwang*][T]. Now it can be asserted that *wherever a hysterical compulsion exists*, *there a repression has taken place*. If, for example, a hysteric cannot eat and feels disgust, then one is dealing with the repression of a reminiscence of something unpleasant which was linked with eating and which was indeed capable of arousing disgust. These facts are revealed by a method of investigation which was first applied by Breuer, and will be discussed later.

All repressed ideas in hysteria share a common characteristic; that is, they are invariably sexual in content and have always been experienced as distressing by the person. Actually, we physicians – who usually value nutrition, sleep, etc. so highly in the explanation of diseases and as the targets of our therapy – should not neglect so badly the sexual functions of our patients. We know from daily experience, at least, how important sexual relationships are for general well-being.

Now the question is: how does the hysterical symptom arise in repression, or through repression? In the main, this concerns something similar to what occurs in obsessional ideas or in delusions of observation, whereby a displacement [*Verschiebung*] of the emphasis – of the psychical intensity[1] – takes place along a pre-established inferential chain of thought.

1 [This is a very early appearance of the term 'psychical intensity' – one of those used by Freud to describe the unknown energy of 'cathexis'. It occurs frequently later, e.g. in *The Interpretation of Dreams* (1900*a*), particularly in the theoretical Chapter VII.]

Conclusion – Scientific Meeting on October 26,[1] *1895*

The doctrine of repression – which the speaker has made the focal point of his deliberations – is, to begin with, more easily discussed in relation to obsessional ideas. In the latter, a memory is at hand, it produces a sense of guilt, and between the two there is a logical association. The formation of the obsessional idea is diphasic. First, the idea of the memory of a particular event releases its psychical intensity, and this is displaced along the path of logical association on to the sense of guilt, which becomes excessively intense. In the second phase, the excessively intense affective inclination connects with some other idea (a *surrogate*). This surrogate idea is the one that the patient complains to us about as the obsessional idea. Now, this mechanism differs in hysteria, above all, in that the repression process is not diphasic. Repression takes place simultaneously with symptom-formation and occurs at certain distinct life-moments in which affect plays a large part (*hypnoid moments*). Such hypnoid moments do not occur in obsessional neurosis [*Zwangsvorstellung*]. Insofar as it has been investigated, hysteria invariably involves sexual ideational material, and always because the first repressions take place before puberty.

With hysteria it is a matter of searching for these repressed ideas. This investigation, however, coincides with the *therapy*. While the physician works at finding these repressed ideas, he cures the patient. This observation was first made by Breuer thirteen years ago, when he managed to comprehend the hysterical symptoms of a patient and [simultaneously] freed her of the compulsion exerted by those symptoms.[2] To this end, he made use of hypnosis, whereby he instructed the patient to transpose herself back into the situation in which the symptom first set in – to the 'moment of repression' therefore, to the 'hypnoid moment'. Under hypnosis, the patient was then in a very good position to find the path from the hysterical symptoms at hand to the [corresponding] repressed ideas. The excessive intensity of the repressed symptoms was thereby brought to an end. In hypnosis, therefore, there is no repression.

Freud replaced this method with another, because he came up against many difficulties in the practical implementation of hypnosis. Freud's procedure actually is identical to that of hypnosis. One connects with the mnemic residue at hand and encourages the patient to say what further recollections occur to her in relation to it. In this way one succeeds in

1 [The correct date is October 28.]

2 [This is, of course, a reference to 'Anna O.', whose case history appears on p. 19 ff. above.]

arousing some of the most distant recollections, those closest to the repressed idea. If the patient cannot find the last idea in a train of thought, one makes the assumption that this idea really is the next in line, but that the patient is not in a position to direct her attention to it. One then urges the patient to concentrate her attention upon this point in the situation by, for example, placing one's hand on her forehead and saying: 'Now, when I press, the event which we are looking for will occur to you.' What the patient then yields is, as a rule, what is being sought. Here the situation is much the same as it is in hypnosis: full psychical attention is turned to the one idea in question. It is assumed that the patients are not in a position to turn their attention to the repressed ideas spontaneously, and that therein lies the essence of repression. The patients resist the recollection of certain ideas. This resistance can only be conceived of as a resistance of the will. If one investigates the motive for this, one very regularly finds that patients experience great unpleasure and become uneasy when an attempt is made to direct attention to repressed and hard-to-remember material. Indeed, this unpleasure is the general reason why they are unable to think of certain ideas and why they never occur to them without external pressure. The feeling of unpleasure also holds sway over repressed memories in normal psychical life, and yet there is a difference: psychically normal people are aware that they do not want to be reminded of something; hysterics are not aware that they do not want this. This psychical state is and remains enigmatic, but we have a word to designate it: we speak of a 'splitting of consciousness' or rather, after Breuer, of a 'splitting of mental activity'.[1]

The resistance which patients put up against the explication of the repressed ideas takes on all possible forms. They particularly frequently make use of excuses.[2] One seeks to expose these, to make it clear to the patients that it is only unpleasure which prevents them from thinking of the actual issue. This method is by no means simple; instead, it belongs among the most demanding tasks accruing to the physician. But its therapeutic worth is no trifle by comparison with the general powerlessness of our [conventional] therapy; it is capable, in principle, of curing the symptoms of repression. It is true that the method is bound to cause patients suffering, but it is incapable of doing them any harm. It resembles an operation which stretches over many weeks and months and which produces much pain, discomfort and unpleasure from which the patient is not spared by any form of anaesthetic. One could raise the

1 ['*Spaltung der Seelentätigkeit*'; see p. 300 *n.* 1 above.]

2 ['*Ausreden*', i.e. rationalization.]

objection against this form of treatment that it can scarcely be worthwhile if it only succeeds in removing symptoms and if one must leave the [underlying] disposition intact. But we observe that patients actually have not put many such repressions into effect during their lives, and that none at all appears to be effected after puberty.

When symptoms develop later on, they usually attach to existing repressions. Thus, when one considers how limited the conditions for the production of repressions are (sexual character, formation before puberty, attachment of new symptoms to repressions formed in childhood), one is justified in the hope that if one succeeds in exposing and reversing the first repression, one might also succeed in blocking the source of further manifestations. Further experience will reveal whether or not this hope is truly justified.

APPENDIX A

THE CHRONOLOGY OF THE CASE OF FRAU EMMY VON N.

There are serious inconsistencies in the dating of the case history of Frau Emmy [307]
von N. as given in all the German editions of the work and as reproduced in the present translation. The beginning of Freud's first course of treatment of Frau Emmy is assigned to May, 1889, twice on p. 44 above. The course lasted for about seven weeks (pp. 47 *n.* 1 and 68). Her second course of treatment began exactly a year after the first (p. 69), i.e. in May, 1890. This course lasted for about eight weeks (p. 47 *n.* 1). Freud visited Frau Emmy on her 'Baltic' estate in the spring of the following year (p. 73 f.), i.e. of 1891. A first contradiction of this chronology appears on p. 75, where the date of this visit is given as May, 1890. This new system of dating is maintained at later points. On p. 81 Freud ascribes a symptom that appeared in the second course of treatment to the year 1889 and symptoms that appeared in the first course of treatment twice to the year 1888. He reverts, however, to his original system on p. 90, where he gives the date of his visit to the estate as 1891.

The matter is made still more obscure by another inconsistency. In a footnote on [308]
p. 55 Freud comments on the over-efficiency of some of his suggestions made during the first period of treatment (actually on May 11, 1888 or 1889). The amnesia which he then produced was, he says, still operative 'eighteen months later'. This certainly refers to the time of his visit to Frau Emmy's country estate, for, in his account of that visit, he mentions the episode once more (p. 74). There, however, he speaks of the original suggestions as having been made 'two years previously'. If the visit to the estate was in May, 1890 or 1891, the 'two years' must be correct and the 'eighteen months' must have been a slip.

These inconsistencies have given rise to much speculation. Fortunately the matter has now been resolved, by Christfried Tögel (1999), who combined his own research with that of Ola Andersson (1979) to produce the following definitive chronology: Emmy von N.'s treatment took place, as Freud tells us, in two phases. The first one, which lasted seven weeks, started in May, 1888. The second one, which lasted eight weeks, started exactly one year later in May, 1889. These dates are consistent with all the independent information and documents gathered by Andersson and Tögel, and are contradicted only by the dates given by Freud himself, which are obviously distorted.

It is evident that when Freud altered the place of 'Emmy von N.'s' residence, as a precaution against betraying the patient's identity, he altered the time of the treatment as well – but failed to carry the changes through consistently. In Chapter X of *The Psychopathology of Everyday Life* (1901*b*) Freud explained his own unnoticed slips in *The Interpretation of Dreams* (1900*a*) as unconscious retaliations for

suppressions and distortions deliberately made by him in the material. Perhaps the same thing happened here.

The exact dating of this case is important because Freud stated that it was his first attempt to use Breuer's technique of investigation under hypnosis (p. 44 above). This means that Freud first used Breuer's technique in May, 1888, in the same month that he wrote the entry on hysteria for Villaret's encyclopaedia (1888*b*).

APPENDIX B

LIST OF WRITINGS BY FREUD DEALING PRINCIPALLY WITH CONVERSION HYSTERIA

In the following list, the date at the beginning of each entry is that of the year during which the work in question was probably written. The date at the end is that of publication; and under that date fuller particulars of the work can be found in the Bibliography. The items in square brackets were published posthumously. [310]

[1886 'Observation of a Pronounced Hemianaesthesia in a Hysterical Male.' (1886*d*)
1888 'Hysteria' in Villaret's *Handwörterbuch*. (1888*b*)
1892 'A Letter to Josef Breuer.' (1941*a*)]
[1892 'On the Theory of Hysterical Attacks.' (With Breuer.) (1940*d*)]
[1892 'Memorandum "III".' (1941*b*)]
1892 'A Case of Successful Treatment by Hypnotism.' (1892–93*a*)
1892 'On the Psychical Mechanism of Hysterical Phenomena: A Preliminary Communication.' (With Breuer.) (1893*a*)
1893 Lecture 'On the Psychical Mechanism of Hysterical Phenomena'. (1893*h*)
1893 'Some Points for a Comparative Study of Organic and Hysterical Motor Paralyses.' (1893*c*)
1894 'The Neuropsychoses of Defence', Section I. (1894*a*)
1895 *Studies on Hysteria*. (With Breuer.) (1895*d*)
[1895 'Project for a Scientific Psychology', Part II. (1950*a*)]
1895 Lecture 'On Hysteria'. (Reports not written by Freud.) (1895*g*)
[1896 'Draft K', Last Section. (1950*a*)]
1896 'Further Remarks on the Neuropsychoses of Defence.' (1896*b*)
1896 'The Aetiology of Hysteria.' (1896*c*)
1901–05 'Fragment of an Analysis of a Case of Hysteria.' (1905*e*)
1908 'Hysterical Phantasies and their Relation to Bisexuality.' (1908*a*)
1909 'Some General Remarks on Hysterical Attacks.' (1909*a*) [311]
1909 *Five Lectures on Psychoanalysis*, Lectures I and II. (1910*a*)
1910 'The Psychoanalytic View of Psychogenic Disturbance of Vision.' (1910*i*)

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

It was presented by Charcot to Freud in Paris, 1886. In his obituary of Charcot, Freud wrote: 'He might be heard to say that the greatest satisfaction a man could have was to see something new – that is, to recognize it as new; and he remarked again and again on the difficulty and value of this kind of "seeing".' (This volume, p. 12.)

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

PREFACE TO FREUD'S *COLLECTION OF SHORTER WRITINGS ON THE THEORY OF THE NEUROSES FROM THE YEARS 1893–1906*

(1906)

EDITORS' NOTE

PREFACE TO *SAMMLUNG KLEINER SCHRIFTEN ZUR NEUROSENLEHRE AUS DEN JAHREN 1893–1906*

GERMAN EDITIONS

1906 *SKSN*, **1**, iii. (1911, 2nd ed.; 1920, 3rd ed.; 1922, 4th ed.) [3]
1925 *GS*, **1**, 241–2.
1952 *GW*, **1**, 557–8.

ENGLISH TRANSLATION

1962 *SE*, **3**, 5–6. (Tr. J. Strachey.)

The present translation is a revised and corrected reprint of the *SE* version.

The volume to which this is the Preface was the first of Freud's five collected volumes of shorter papers, the others of which appeared in 1909, 1913, 1918 and 1922. The present volume of the *Revised Standard Edition* includes the majority of the contents of this first collection. The first of the French papers, however, which compares organic and hysterical paralyses (1893*c*), has been included in Volume 1 of the *RSE*, as belonging almost wholly to the pre-psychoanalytic epoch. Similarly, the last three of its items (the two from the Löwenfeld volumes, 1904*a* and 1906*a*, as well as the paper 'On Psychotherapy', 1905*a*), which are of a later date than the rest, can be found in Volume 7 of the *RSE*. Moreover, the 'Preliminary Communication' (1893*a*), which was reprinted in *Studies on Hysteria* (1895*d*), is included in Volume 2 of the *RSE* and has not been repeated here.

Its place is taken, however, by a lecture (1893*h*) which was contemporary with the 'Preliminary Communication' and covers the same ground, of which there is a shorthand report corrected by Freud. This is complemented, for the first time in this revised edition, by Freud's own abstract of a lecture on obsessional ideas and phobias (1895*h*). The present volume contains two further papers which Freud omitted from his collection: the discussion on forgetting (1898*b*), which was afterwards developed into the first chapter of *The Psychopathology of Everyday Life*, and the paper on [4] 'Screen Memories' (1899*a*). It also includes the list of abstracts of Freud's earlier works (1897*b*), which he himself drew up with an eye to his application for a professorship, and two short reviews from this period which were not included in the *SE* (1895*i*, 1895*j*).

PREFACE TO FREUD'S *COLLECTION OF SHORTER WRITINGS ON THE THEORY OF THE NEUROSES FROM THE YEARS 1893–1906*

In response to many wishes that have reached me, I have decided to lay [5]
before my colleagues in collected form the minor works on the neuroses which I have published since 1893. They consist of fourteen short papers, mostly in the nature of preliminary communications, which have appeared in scientific proceedings or medical periodicals – three of them in French. The two last (XIII and XIV),[1] which give a very succinct account of my present position as regards both the aetiology and the treatment of the neuroses, are taken from L. Löwenfeld's well-known volumes, *Die psychischen Zwangserscheinungen* [Psychical Compulsive Phenomena], 1904, and the fourth edition of *Sexualleben und Nervenleiden* [Sexual Life and Nervous Illness], 1906, having been written by me at the request of their author, who is an acquaintance of mine. [See p. 107 below.]

The present collection serves as an introduction and supplement to my larger publications dealing with the same topics – *Studies on Hysteria* (with Dr J. Breuer), 1895; *The Interpretation of Dreams*, 1900; *The Psychopathology of Everyday Life*, 1901 and 1904; *Jokes and their Relation to the Unconscious*, 1905; *Three Essays on the Theory of Sexuality*, 1905; *Fragment of an Analysis of a Case of Hysteria*, 1905. The fact that I have put my obituary of J.-M. Charcot at the head of this collection of my short papers should be regarded not only as the repayment of a debt of gratitude, but also as an indication of the point at which my own work branches off from the master's.

No-one who is familiar with the course of development of human knowledge will be surprised to learn that I have in the meantime gone beyond some of the opinions which are expressed here, and have seen my way to modifying others. Nevertheless, I have been able to retain the greater part of them unaltered and in fact have no need to withdraw [6]
anything as wholly erroneous or completely worthless.[2]

1 [See Editors' Note, p. 3 above.]

2 [It may be remarked that, when these papers were reprinted in the first German collected edition of Freud's works (*GS*, **1**) in 1925, he added a few critical footnotes. See, for instance, p. 178 *n.* 1 below.]

CHARCOT

(1893)

1925 *GS*, **1**, 243–57.
1952 *GW*, **1**, 21–35.
2015 *SFG*, **4**, 311–24.

ENGLISH TRANSLATIONS

'Charcot'
1924 *CP*, **1**, 9–23. (Tr. J. Bernays.)
1962 *SE*, **3**, 11–23. (Tr. James Strachey, based on that of 1924.)

Included (No. XXII) in Freud's own collection of abstracts of his early works (1897*b*). The present translation is a revised and corrected reprint of the *SE* version. It is also included in *NSW*, **4**.

From October, 1885, to February, 1886, Freud worked at the Salpêtrière in Paris under Charcot.[1] This was the turning point in his career, for it was during this period that his interest shifted from neuropathology to psychopathology – from physical science to psychology. This fundamental shift coincided with another: from the theoretical-physiological traditions of German and Austro-Hungarian neurology to the clinical-descriptive, nosological approach of the French school. Whatever other and deeper factors were concerned in the changes, the immediate determinant was undoubtedly the personality of Charcot. As he wrote to his future wife soon after his arrival in Paris (November 24, 1885): 'I think I am changing a great deal. I will tell you in detail what is affecting me. Charcot, who is one of the greatest of physicians and a man whose common sense is touched by genius, is simply uprooting my aims and opinions. I sometimes come out of his lectures as though I were coming out of Notre Dame, with a new idea of perfection. But he exhausts me; when I come away from him I no longer have any desire to work at my own silly things; it is three whole days since I have done any work, and I have no feelings of guilt. My brain is sated, as if I [10] had spent an evening at the theatre. Whether the seed will ever bear any fruit, I do

1 Jean-Martin Charcot (1825–93).

not know; but what I do know is that no-one else has ever affected me in the same way. . . .'[1] This obituary, written only a few days after Charcot's death, is further evidence of the greatness of Freud's admiration for him, and to the end of his own life Freud never lost it. Sayings of Charcot's were constantly cropping up in Freud's writings, and in all his accounts of his own development the part played by Charcot was never forgotten.

Though the present is Freud's longest study on him, it can be supplemented from two or three other works: from Freud's official report to the authorities of the University of Vienna on the course of his studies in Paris (1956*a* [1886]), *RSE*, **1**, 5 ff., which is the source of some of the material in this obituary, from his 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 10–11, from the *Autobiographical Study* (1925*d*), ibid., **20**, 10–11, as well as from the first volume of Ernest Jones's biography (1953, 202–5).[2]

1 An English translation of this letter is included in a collection of Freud's correspondence (Freud, 1960*a*).

2 Freud translated two of Charcot's books into German at their author's request: the third volume of his *Leçons sur les maladies du système nerveux* (1887), the German version of which was published before the second half of the French original (Freud, 1886*f*), and the *Leçons du mardi (1887–8)* (Freud, 1892–94*a*). Freud added a number of footnotes to the latter volume, without Charcot's permission; and this seems to have led to trouble. See a passage near the end of Chapter VII of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 139. A second volume of the *Leçons du mardi*, dealing with the academic year 1888–9, was translated by Max Kahane (1895), an early follower of Freud's. Perhaps the most enthusiastic of all Freud's accounts of Charcot is to be found at the end of his Preface to the translation of the *Leçons du mardi* (Freud, 1892–94*a*), *RSE*, **1**, 163–4.

CHARCOT

On the 16th of August of this year, J.-M. Charcot died suddenly, without pain or illness, after a life of happiness and fame. In him, all too soon, the young science of neurology has lost its greatest leader, neurologists of every country have lost their master teacher and France has lost one of her foremost men. He was only sixty-eight years old; his physical strength and mental vigour, together with the hopes he so frankly expressed, seemed to promise him the long life which has been granted to not a few mental workers [*Geistesarbeitern*][T] of this century. The nine imposing volumes of his *Oeuvres complètes*, in which his pupils had collected his contributions to medicine and neuropathology, his *Leçons du mardi*, the yearly reports of his clinic at the Salpêtrière, and other works besides – all these publications will remain precious to science and to his pupils; but they cannot take the place of the man, who had still much more to give and to teach and whose person or whose writings no-one has yet approached without learning something from them. [11] *Geist*

He took an honest, human delight in his own great success and used to enjoy talking of his beginnings and the road he had travelled. His scientific curiosity, he said, had been aroused early, when he was still a young *interne*,[1] by the mass of material presented by the facts of neuropathology, material which was not in the least understood at the time. In those days, whenever he went the rounds with his senior in one of the departments of the Salpêtrière (the institution for the care of women) amid all the wilderness of paralyses, spasms and convulsions for which forty years ago there was neither name nor understanding, he would say: '*Faudrait y retourner et y rester*',[2] and he kept his word. When he became *médecin des hôpitaux*,[3] he at once took steps to enter the Salpêtrière in one of the departments for nervous patients. Having got there, he stayed where he was instead of doing what French consultant physicians are entitled to

1 [The French equivalent of the English 'house physician'.]

2 ['I shall have to come back here and stop here.']

3 [The French equivalent of an English 'consultant physician'.]

[12] do – transferring in regular succession from one department to another and from hospital to hospital, and at the same time changing their speciality as well.

Thus his first impression and the resolution it led him to were decisive for the whole of his further development. His having a great number of chronic nervous patients at his disposal enabled him to make use of his own special gifts. He was not unduly reflective, not a thinker: he had the nature of an artist – he was, as he himself said, a '*visuel*', a man who sees [*ein Seher*][t]. Here is what he himself told us about his method of working. He used to look again and again at the things he did not know,[1] to deepen his impression of them day by day, till suddenly an understanding [*Verständnis*] of them dawned on him.[2] In his mind's eye the apparent chaos presented by the continual repetition of the same symptoms then gave way to order: the new nosological pictures emerged, characterized by the constant combination of certain groups of symptoms. The complete and extreme cases, the 'types', could be brought into prominence with the help of a certain sort of schematic planning, and, with these types as a point of departure, the eye could travel over the long series of ill-defined cases – the '*formes frustes*'[3] – which, branching off from one or other characteristic feature of the type, melt away into indistinctness. He called this kind of intellectual work, in which he had no equal, 'practising nosography', and he took pride in it. He might be heard to say that the greatest satisfaction a man could have was to see something new – that is, to recognize it as new; and he remarked again and again on the difficulty and value of this kind of 'seeing'. He would ask why it was that in medicine people only see what they have already learnt to see. He would say that it was wonderful how one was suddenly able to see new things – new states of illness – which must probably be as old as the human race; and that he had to confess to himself that he now saw a
[13] number of things which he had overlooked for thirty years in his hospital wards. No physician needs to be told what a wealth of forms were acquired by neuropathology[4] through him, and what increased precision and sureness of diagnosis were made possible by his observations. But

1 [*nicht kannte*. Translated 'did not understand' in the *SE*. The context implies unfamiliarity at least as much as incomprehension.]

2 [Freud had remarked on this in his Paris Report (1956*a* [1886]) and quoted it again in a slightly different form in his history of the psychoanalytic movement (1914*d*), *RSE*, **14**, 18, and in his short message to *Le Disque Vert* (1924*a*), ibid., **19**, 296.]

3 [The French word '*fruste*', with the meaning 'blurred', is primarily applied to 'rubbed' coins or medals. Cf. footnote 1, p. 74 below.]

4 [It should be remarked that the term 'neuropathology' was closer in meaning to the modern 'neurology' than what is nowadays meant by 'neuropathology'.]

the pupil who spent many hours with him going round the wards of the Salpêtrière – that museum of clinical facts, the names and peculiar characteristics of which were for the most part derived from him – would be reminded of Cuvier, whose statue, standing in front of the Jardin des Plantes,[1] shows that great comprehender and describer of the animal world surrounded by a multitude of animal forms; or else he would recall the myth of Adam, who, when God brought the creatures of Paradise before him to be distinguished and named, may have experienced to the fullest degree that intellectual enjoyment which Charcot praised so highly.

Charcot, indeed, never tired of defending the rights of purely clinical work, which consists in seeing and ordering things, against the encroachments of theoretical medicine. On one occasion there was a small group of us, all students from abroad, who, brought up on German academic physiology, were trying his patience with our doubts about his clinical innovations. 'But that can't be true,' one of us objected, 'it contradicts the Young–Helmholtz theory.' He did not reply 'So much the worse for the theory, clinical facts come first' or words to that effect; but he did say something which made a great impression on us: '*La théorie, c'est bon, mais ça n'empêche pas d'exister*.'[2]

For a whole number of years Charcot occupied the Chair of Pathological Anatomy in Paris, and he carried on his neuropathological studies and lectures, which quickly made him famous abroad as well as in France, on a voluntary basis and as a secondary occupation. It was a piece of good fortune for neuropathology that the same man could undertake the [14] discharge of two functions: on the one hand he created the nosological picture through clinical observation, and on the other he demonstrated that the same anatomical changes underlay the disease whether it appeared as a type or as a *forme fruste*. It is very generally recognized how successful this anatomical-clinical method of Charcot's was in the field of organic nervous diseases – in tabes, multiple sclerosis, amyotrophic lateral sclerosis [motor neurone disease], and so on. Years of patient waiting were often necessary before the presence of organic change could be proved in those chronic illnesses which are not directly

1 [The Paris zoological gardens.]

2 ['Theory is good; but it doesn't prevent things from existing.' This was a favourite quotation of Freud's and he repeated it all through his life. (See, for instance, the 'Dora' case history (1905*e*), *RSE*, **7**, 102, Lecture IX of the *Introductory Lectures* (1916–17*a*), ibid., **15**, 127, and the *Autobiographical Study* (1925*d*), ibid., **20**, 11.) On the first occasion on which Freud told the story – in a footnote to his translation of Charcot's *Leçons du mardi (1887–8)* (Freud, 1892–94*a*), ibid., **1**, 166 f. – he revealed the fact that the objector who provoked Charcot's repartee was Freud himself.]

fatal; and only in a hospital for incurables like the Salpêtrière was it possible to keep the patients under observation for such long periods of time.[1] Charcot made his first demonstration of this kind before he had charge of a department. While he was still a student he happened to engage a maidservant who suffered from a peculiar tremor and could not find a situation on account of her clumsiness. Charcot recognized her condition as a *paralysie choréiforme*, a disease which had already been described by Duchenne, but whose basis was unknown. Charcot kept this interesting servant, although in the course of the years she cost him a small fortune in dishes and plates. When at last she died he was able to demonstrate from her case that *paralysie choréiforme* was the clinical expression of multiple cerebrospinal sclerosis [multiple sclerosis].

Pathological anatomy has to serve neuropathology in two ways. Besides demonstrating the presence of a morbid change, it must establish the localization of that change; and we all know that during the last two decades the second part of this task has aroused the greater interest of the two and has been more actively pursued. Charcot played a most distinguished part in this work, too, although the pioneer discoveries were not made by him. To begin with he followed in the footsteps of our fellow countryman, Türck, who is said to have lived and carried on his researches in comparative isolation among us. When the two great
[15] innovations came – the Hitzig–Fritsch stimulation experiments and Flechsig's findings on the development of the spinal cord[2] – which ushered in a new epoch in our knowledge of the 'localization of nervous diseases', Charcot's lectures on localization played the largest and best part towards bringing the new theories into touch with the clinical work and making them fruitful for it. Especially as regards the relationship of the somatic muscular apparatus to the motor area of the human cerebrum, I may remind the reader of the long time during which the more exact nature and topography of this relationship was in question. (Was there a common representation of both extremities in the same areas? or was there a representation of the upper extremity in the anterior central convolution and of the lower extremity in the posterior one – that is, a vertical disposition?) At last, continued clinical observations and experiments in stimulation and extirpation on living subjects during surgical

1 [Jones (1953, 231) refers to a case at the Salpêtrière entrusted by Charcot to Freud for an autopsy. It was the case of a woman who had been in the hospital since 1853, suffering from the effects of an embolism. Freud reported on the case in 1891*a*; *NSW*, **2**. Cf. p. 241 below.]

2 [Freud used Flechsig's myelogenetic method in his own neuroanatomical research (Freud, 1885*d*, 1886*b*, 1886*c*; *NSW*, **1**). Flechsig reappears later in Freud's writings as the subject of Schreber's delusions (Freud, 1911*c*; *RSE*, **12**, 10 f.).]

operations decided the question in favour of the view of Charcot and Pitres that the middle third of the central convolutions mainly serves the representation of the arm, while the upper third and the mesial portion serve that of the leg – that is to say, that in the motor area the disposition is a horizontal one.[1]

An enumeration of Charcot's separate contributions would not enable us to establish his significance for neuropathology. For during the last two decades there have not been many themes of any importance in whose formulation and discussion the school of the Salpêtrière has not had an outstanding share; and the 'school of the Salpêtrière' was, of course, Charcot himself, who, with the wealth of his experience, the transparent clarity of his diction and the plasticity of his descriptions, could easily be recognized in every publication of the school. Among the circle of young men whom he thus gathered round him and made into participants in his researches, a few eventually rose to a consciousness of their own individuality and made a brilliant name for themselves. Now and then, even, it happened that one of them would come forward with an assertion which seemed to the master to be more clever than correct; and this he would argue against with plenty of sarcasm in his conversation and lectures, but without doing any damage to his affectionate relationship with his pupil. And in fact Charcot leaves behind him a host of pupils whose intellectual quality and whose achievements up to now [16] are a guarantee that the study and practice of neuropathology in Paris will not so quickly slip down from the height to which Charcot has brought them.

In Vienna we have repeatedly had occasion to realize that the intellectual significance of an academic teacher is not necessarily combined with a direct personal influence on younger men which leads to the creation of a large and important school. If Charcot was so much more fortunate in this respect we must put it down to the personal qualities of the man – to the magic that emanated from his looks and from his voice, to the kindly openness which characterized his manner as soon as his relations with someone had overcome the stage of initial strangeness, to the willingness with which he put everything at the disposal of his pupils, and to his lifelong loyalty to them. The hours he spent in his wards were hours of companionship and of an exchange of ideas with the whole of his medical staff. He never shut himself away from them there. The youngest newly qualified physician walking the wards had a chance of

1 [Freud appears to have transposed the words 'vertical' and 'horizontal' in this and the previous sentence.]

seeing him at his work and might interrupt him at it; and the same freedom was enjoyed by students from abroad, who, in later years, were never lacking at his rounds. And, lastly, on the evenings when Madame Charcot was at home to a distinguished company, assisted by a highly gifted daughter who was growing up in the likeness of her father, the pupils and medical assistants who were always present met the guests as part of the family.

In 1882 or 1883, the circumstances of Charcot's life and work took on their final form. People had come to realize that the activities of this man were a part of the assets of the nation's '*gloire*', which, after the unfortunate war of 1870–1, was all the more jealously guarded. The government, at the head of which was Charcot's old friend, Gambetta, created a Chair of Neuropathology for him in the Faculty of Medicine (so that he could give up the Chair of Pathological Anatomy)[1] and also a clinic, with auxiliary scientific departments, at the Salpêtrière. '*Le service de M. Charcot*' now included, in addition to the old wards for chronic female patients, several clinical rooms where male patients, too, were received, a huge out-patient department – the '*consultation externe*' – a histological laboratory, a museum, an electro-therapeutic department, an eye and ear
[17] department and a special photographic studio. All these things were so many means of keeping former assistants and pupils permanently at the clinic in secure posts. The two-storeyed, weathered-looking buildings and the courtyards which they enclosed reminded the stranger vividly of our Allgemeines Krankenhaus;[2] but no doubt the resemblance did not go far enough. 'It may not be beautiful here, perhaps,' Charcot would say when he showed a visitor his domain, 'but there is room for everything you want to do.'

Charcot was in the very prime of life when this abundance of facilities for teaching and research were placed at his disposal. He was a tireless worker, and always, I believe, the busiest in the whole institute. His private consultations, to which patients flocked 'from Samarkand and the Antilles',[3] could not keep him from his teaching activities or his researches. There is no doubt that this throng of people did not turn to him solely because he was a famous discoverer but quite as much because he was a great physician and friend of humanity, who could always find an answer to a problem and who, when the present state of science did

1 [This was the first chair of Neurology established anywhere in the world.]

2 [The General Hospital in Vienna. In what follows, Freud possibly had in mind the unsatisfactory laboratories at the Salpêtrière as compared with those he was accustomed to in Vienna. Cf. the 'Paris Report' (1956*a* [1886]), *RSE*, **1**, 8.]

3 [The quotation has not been traced.]

not allow him to *know*, was able to make a good guess. He has often been blamed for his therapeutic method which, with its multiplicity of prescriptions, could not but offend a rationalistic conscience. But he was simply continuing the procedures which were customary at that time and place, without deceiving himself much about their efficacy. He was, however, not pessimistic in his therapeutic expectations, and repeatedly showed readiness to try new methods of treatment in his clinic: their shortlived success was to find its explanation elsewhere.

As a teacher, Charcot was positively fascinating. Each of his lectures was a little work of art in construction and composition; it was perfect in form and made such an impression that for the rest of the day one could not get the sound of what he had said out of one's ears or the thought of what he had demonstrated out of one's mind. He seldom demonstrated a single patient, but mostly a series of similar or contrasting cases which [18]
he compared with one another. In the hall in which he gave his lectures there hung a picture which showed 'citizen' Pinel having the chains taken off the poor madmen in the Salpêtrière.[1] The Salpêtrière, which had witnessed so many horrors during the Revolution, had also been the scene of this most humane of all revolutions. At such lectures Maître Charcot himself made a curious impression. He, who at other times bubbled over with vivacity and cheerfulness and who always had a joke on his lips, now looked serious and solemn under his little velvet cap; indeed, he even seemed to have grown older. His voice sounded subdued. We could almost understand how ill-disposed strangers could reproach the whole lecture with being theatrical. Those who spoke like this were doubtless accustomed to the formlessness of German clinical lectures, or else forgot that Charcot gave only *one* lecture in the week and could therefore prepare it carefully.

In this formal lecture, in which everything was prepared and everything had to have its place, Charcot was no doubt following a deeply rooted tradition; but he also felt the need to give his audience a less elaborated picture of his activities. This purpose was served by his outpatient clinic of which he took personal charge in what were known as his '*Leçons du mardi*'. There he took up cases which were completely unknown to him; he exposed himself to all the chances of an examination, all the errors of a first investigation; he would put aside his authority on occasion and admit – in one case that he could arrive at no diagnosis and in another that he had been deceived by appearances; and

1 [Philippe Pinel (1745–1826) was appointed as head physician at the Salpêtrière in 1794, at the time of the French Revolution, and initiated the more humane treatment of the insane.]

he never appeared greater to his audience than when, by giving the most detailed account of his processes of thought and by showing the greatest frankness about his doubts and hesitations, he had thus sought to narrow the gulf between teacher and pupil. The publication of these improvised lectures, given in the years 1887 and 1888, at first in French and now in German as well, has also immeasurably widened the circle of his admirers; and never before has a work on neuropathology had such a success with the medical public as this.

[19] At about the time at which the clinic was established and at which he gave up the Chair of Pathological Anatomy, a change occurred in the direction of Charcot's scientific pursuits, and to this we owe the finest of his work. He now pronounced that the theory of organic nervous illnesses was for the time being fairly complete, and he began to turn his attention almost exclusively to hysteria, which thus all at once became the focus of general interest. This, the most enigmatic of all nervous diseases, for the evaluation of which medicine had not yet found a serviceable angle of approach, had just then fallen into thorough discredit; and this discredit extended not only to the patients but to the physicians who concerned themselves with the neurosis. It was held that in hysteria anything was possible, and no credence was given to a hysteric about anything. The first thing that Charcot's work did was to restore its dignity to the topic. Little by little, people gave up the scornful smile with which the patient could at that time feel certain of being met. She was no longer necessarily a malingerer, for Charcot had thrown the whole weight of his authority on the side of the genuineness and objectivity of hysterical phenomena. Charcot had repeated on a small scale the act of liberation in memory of which Pinel's portrait hung in the lecture hall of the Salpêtrière. Once the blind fear of being made a fool of by the unfortunate patient had been given up – a fear which till then had stood in the way of a serious study of the neurosis – the question could arise as to what method of approach would lead most quickly to a solution to the problem. A quite unbiased observer might have arrived at this conclusion: if I find someone in a state which bears all the signs of a painful affect – weeping, screaming and raging – the conclusion seems probable that a mental process is going on in him of which those physical phenomena are the appropriate expression. A healthy person, if he were asked, would be in a position to say what impression it was that was tormenting him; but the hysteric would answer that he did not know. The problem would at once arise of how it is that a hysterical patient is overcome by an affect about whose cause he asserts that he knows nothing. If

we keep to our conclusion that a corresponding psychical process *must* be present, and if nevertheless we believe the patient when he denies it; if we bring together the many indications that the patient is behaving as though he *does* know about it; and if we enter into the history of [20]
the patient's life and find some occasion, some trauma, which would appropriately evoke precisely those expressions of feeling – then everything points to one solution: the patient is in a special state of mind in which all his impressions or his recollections of them are no longer held together by an associative chain, a state of mind in which it is possible for a recollection to express its affect by means of somatic phenomena without the group of the other mental processes, the ego [*Ich*][T], knowing about it or being able to intervene to prevent it. If we had called to mind the familiar psychological difference between sleep and waking, the strangeness of our hypothesis might have seemed less. No-one should object that the theory of a splitting of consciousness as a solution to the riddle of hysteria is much too remote to impress an unbiased and untrained observer. For, by pronouncing possession by a demon to be the cause of hysterical phenomena, the Middle Ages in fact chose this solution; it would only have been a matter of exchanging the religious terminology of that dark and superstitious age for the scientific language of today.[1]

Charcot, however, did not follow this path towards an explanation of hysteria, although he drew copiously upon the surviving reports of witch trials and of possession, in order to show that the manifestations of the neurosis were the same in those days as they are now. He treated hysteria as just another topic in neuropathology; he gave a complete description of its phenomena, demonstrated that these had their own laws and uniformities, and showed how to recognize the symptoms which enable a diagnosis of hysteria to be made. The most painstaking investigations, initiated by himself and his pupils, extended over hysterical disturbances of sensibility in the skin and deeper tissues, over the behaviour of the sense organs, and over the peculiarities of hysterical contractures and paralyses, and of trophic disturbances and changes in metabolism. The many different forms of hysterical attack were described, and a schematic plan was drawn up by depicting the typical configuration of the major hysterical attack ['*grande hystérie*'] as occurring in four stages, [21]
which made it possible to trace the commonly observed 'minor' attacks

1 [Cf. some remarks to the same effect at the beginning of Freud's paper, written some thirty years later, on 'A Seventeenth-Century Demonological Neurosis' (1923*d*), *RSE*, **19**, 63, where a reference to Charcot can also be found.]

['*petite hystérie*'] back to this same typical configuration. The localization and frequency of occurrence of the so-called 'hysterogenic zones' and their relationship to the attacks were also studied, and so on. Once all this information about the manifestations of hysteria had been arrived at, a number of surprising discoveries were made. Hysteria in males, and especially in men of the working class, was found far more often than had been expected; it was convincingly shown that certain conditions which had been put down to alcoholic intoxication or lead poisoning were of a hysterical nature; it was possible to subsume under hysteria a whole number of affections which had hitherto not been understood and which had remained unclassified; and where the neurosis had become joined with other disorders to form complex pictures, it was possible to separate out the part played by hysteria. Most far-reaching of all were the investigations into nervous illnesses which followed upon severe traumas – the 'traumatic neuroses' – views about which are still under discussion and in connection with which Charcot has successfully put forward the arguments in favour of hysteria.

After the latest extensions of the concept of hysteria had so often led to a rejection of aetiological diagnosis, it became necessary to enter into the aetiology of hysteria itself. Charcot put forward a simple formula for this: heredity was to be regarded as the sole cause. Accordingly, hysteria was a form of degeneracy, a member of the '*famille névropathique*'. All other aetiological factors played the part of incidental causes, of '*agents provocateurs*'.[1]

The construction of this great edifice was naturally not achieved without violent opposition. But it was the sterile opposition of an old generation who did not want to have their views changed. The younger among the neuropathologists, including those in Germany, accepted Charcot's teaching to a greater or lesser degree. Charcot himself was completely certain that his theories about hysteria would triumph. When it was objected that the four stages of hysteria, hysteria in men, and so on,
[22] were not observable outside France, he pointed out how long he himself had overlooked these things, and he said once more that hysteria was the same in all places and at every time. He was very sensitive about the accusation that the French were a far more neurotic nation than any other and that hysteria was a kind of national bad habit; and he was much pleased when a paper 'On a Case of Reflex Epilepsy', which dealt with a Prussian grenadier, enabled him to make a long-range diagnosis of hysteria.

1 [Cf. Freud's detailed criticism of this view in 'Heredity and the Aetiology of the Neuroses' (1896*a*), p. 153 ff. below.]

At one point in his work Charcot rose to a level higher even than that of his usual treatment of hysteria. The step he took assured him for all time, too, the fame of having been the first to explain hysteria. While he was engaged in the study of hysterical paralyses arising after traumas, he had the idea of artificially reproducing those paralyses, which he had earlier differentiated with care from organic ones. For this purpose he made use of hysterical patients whom he put into a state of somnambulism by hypnotizing them. He succeeded in proving, by an unbroken chain of argument, that these paralyses were the result of ideas which had dominated the patient's brain at moments of a special disposition. In this way, the mechanism of a hysterical phenomenon was explained for the first time. This incomparably fine piece of clinical research was afterwards taken up by his own pupil, Pierre Janet, as well as by Breuer and others, who developed from it a theory of neurosis which coincided with the mediaeval view – when once they had replaced the 'demon' of clerical phantasy [*Phantasie*][T] by a psychological formula.

Charcot's concern with hypnotic phenomena in hysterical patients led to very great advances in this important field of hitherto neglected and despised facts, for the weight of his name put an end once and for all to any doubt about the reality of hypnotic manifestations. But the exclusively nosographical approach adopted at the school of the Salpêtrière was not suitable for a purely psychological subject. The restriction of the study of hypnosis to hysterical patients, the differentiation between major and minor hypnotism, the hypothesis of three stages of 'major hypnosis', and their characterization by somatic phenomena – all this sank in the estimation of Charcot's contemporaries when Liébeault's pupil, Bernheim, set about constructing the theory of hypnotism on a more comprehensive psychological foundation and [23]
making suggestion the central point of hypnosis. It is only the opponents of hypnotism who, content to conceal their lack of personal experience behind an appeal to authority, still cling to Charcot's assertions and who like to take advantage of a pronouncement made by him in his last years, in which he denied to hypnosis any value as a therapeutic method.[1]

Furthermore, the aetiological theories supported by Charcot in his doctrine of the '*famille névropathique*', which he made the basis of his whole concept of nervous disorders, will no doubt soon require sifting and emending. So greatly did Charcot overestimate heredity as a causative agent that he left no room for the acquisition of nervous illness. To

1 [It may be remarked that in the Introduction with which in 1888 Freud had prefaced his translation of Bernheim's *De la suggestion* he had been decidedly critical of Bernheim's views. (See Freud, 1888–89*a*; *RSE*, **1**, 81 ff.) He repeated his criticisms still more forcibly thirty years later in his *Group Psychology* (1921*c*), ibid., **18**, 84 and 119 *n*.]

syphilis he merely allotted a modest place among the '*agents provocateurs*'; nor did he make a sufficiently sharp distinction between organic nervous affections and neuroses, either as regards their aetiology or in other respects. It is inevitable that the advance of our science, as it increases our knowledge, must at the same time lessen the value of a number of things that Charcot taught us; but neither changing times nor changing views can diminish the fame of the man whom – in France and elsewhere – we are mourning today.

Vienna, August, 1893

ON THE PSYCHICAL MECHANISM OF HYSTERICAL PHENOMENA: A LECTURE

(1893)

EDITORS' NOTE

ÜBER DEN PSYCHISCHEN MECHANISMUS HYSTERISCHER PHÄNOMENE

'On the Psychical Mechanism of Hysterical Phenomena'
1956 *Int. J. Psycho-Anal.*, **37** (1), 8–13. (Tr. James Strachey.)
1962 *SE*, **3**, 27–39. (Slightly amended reprint of the 1956 version.)

The present translation is a revised and corrected reprint of the *SE* version.

The German original is headed with the words 'By Dr Josef Breuer and Dr Sigm. Freud of Vienna'. But this is in fact a shorthand report of a lecture delivered by Freud and revised by him. Though it deals with the same subject matter (and often in similar terms) as the famous 'Preliminary Communication' (1893*a*), which has its proper place in the *Revised Standard Edition* in Volume 2 at the beginning of *Studies on Hysteria* (1895*d*), this lecture bears every mark of being the sole work of Freud.

The Breuer & Freud 'Preliminary Communication' was published in a Berlin periodical, the *Neurologisches Zentralblatt*, in two instalments on January 1 and 15, 1893. (It was immediately afterwards reprinted in Vienna in the *Wiener medizinische Blätter* of January 19 and 26.) The lecture which is printed here was delivered by Freud at a meeting of the Vienna Medical Club on January 11 – that is to say, before the second instalment of the 'Preliminary Communication' had been published.

What is perhaps the most noticeable thing about the lecture is the preponderance of the traumatic factor among the causes assigned for hysteria. This is, of course, a proof of the strength of Charcot's influence upon Freud's ideas. The shift over to a realization of the part played by 'drive impulses' still lay in the future.

ON THE PSYCHICAL MECHANISM OF HYSTERICAL PHENOMENA[1]

Gentlemen, I am appearing before you today with the object of giving you a report on a work the first part of which has already been published in the *Zentralblatt für Neurologie* under the names of Josef Breuer and myself. As you may gather from the title of the work, it deals with the pathogenesis of hysterical symptoms and suggests that the immediate reasons for the development of hysterical symptoms are to be looked for in the sphere of psychical life. [27]

But before I enter further into the contents of this joint work, I must explain the position it occupies and name the author and the discovery which, in substance at least, we have taken as our starting point, although our contribution has been developed quite independently.

As you know, gentlemen, all the modern advances made in the understanding and knowledge of hysteria are derived from the work of Charcot. In the first half of the eighties, Charcot began to turn his attention to the 'major neurosis', as the French call hysteria. In a series of researches he has succeeded in proving the presence of regularity and law where the inadequate or half-hearted clinical observations of other people saw only malingering or a puzzling lack of conformity to rule. It may safely be said that everything new that has been learnt about hysteria in recent times goes back directly or indirectly to his stimulus. But among Charcot's numerous works, none, in my estimate, is of higher value than the one in which he taught us to understand the traumatic paralyses which appear in hysteria; and since it is precisely this work of which ours appears as a continuation, I hope you will allow me to lay this subject before you once again in some detail.

We will take the case of a person who is subjected to a trauma without having been ill previously and perhaps without even having any [28]

1 A lecture delivered by Dr Sigm. Freud at a meeting of the Wiener medizinischer Club on January 11, 1893. Special shorthand report by the *Wiener medizinische Presse*, revised by the lecturer. [This footnote appeared in the original publication.]

hereditary taint. The trauma must fulfil certain conditions. It must be severe – that is, it must be of a kind involving the idea [*Vorstellung*][T] of mortal danger, of a threat to life. But it must not be severe in the sense of bringing psychical activity to an end. Otherwise it will not produce the result we expect from it. Thus, for instance, it must not involve concussion of the brain or any really serious injury. Moreover, the trauma must have a special relation to some part of the body. Let us suppose that a heavy billet of wood falls on a workman's shoulder. The blow knocks him down, but he soon realizes that nothing has happened and goes home with a slight contusion. After a few weeks, or after some months, he wakes up one morning and notices that the arm that was subjected to the trauma is hanging down limp and paralysed, though in the interval, in what might be called the incubation period, he has made perfectly good use of it. If the case is a typical one, it may happen that peculiar attacks set in – that, after an aura,[1] the subject suddenly collapses, raves, and becomes delirious; and, if he speaks in his delirium, what he says may show that the scene of his accident is being repeated in him, embellished, perhaps, with various imaginary pictures. What has been happening here? How is this phenomenon to be explained?

Charcot explains the process by reproducing it, by inducing the paralysis in a patient artificially. In order to bring this about, he needs a patient who is already in a hysterical state; he further requires the condition of hypnosis and the method of suggestion. He puts a patient of this kind into deep hypnosis and gives him a light blow on the arm. The arm drops; it is paralysed and shows precisely the same symptoms as occur in spontaneous traumatic paralysis. The blow may also be replaced by a direct verbal suggestion: 'Look! your arm is paralysed!' In this case too the paralysis exhibits the same characteristics.

Let us try to compare the two cases: on the one hand a trauma, on the other a traumatic suggestion. The final result, the paralysis, is exactly
[29] the same in both cases. If the trauma in the one case can be replaced in the other case by a verbal suggestion, it is plausible to suppose that an idea of this kind was responsible for the development of the paralysis in the case of the spontaneous traumatic paralysis as well. And in fact a number of patients report that at the moment of the trauma they actually had a feeling that their arm was smashed. If this were so, the trauma could really be completely equated with the verbal suggestion. But to complete the analogy a third factor is required. In order that the idea 'your arm is paralysed' should be able to provoke a paralysis in the

1 [The premonitory sensations which precede an epileptic or hysterical attack.]

patient, it was necessary for him to be in a state of hypnosis. But the workman was not in a state of hypnosis. Nevertheless, we may assume that he was in a special state of mind during the trauma; and Charcot is inclined to equate that affect with the artificially induced state of hypnosis. This being so, the traumatic spontaneous paralysis is completely explained and brought into line with the paralysis produced by suggestion; and the genesis of the symptom is unambiguously determined by the circumstances of the trauma.

Charcot has, moreover, repeated the same experiment in order to explain the contractures and pains which appear in traumatic hysteria; and in my opinion there is scarcely any point at which he has penetrated into the understanding of hysteria more deeply than here. But his analysis goes no further: we do not learn how other symptoms are generated, and above all we do not learn how hysterical symptoms come about in common, non-traumatic hysteria.

At about the same time, gentlemen, at which Charcot was thus throwing light on hystero-traumatic paralyses, Dr Breuer, between 1880 and 1882, undertook the medical care of a young lady who – with a non-traumatic aetiology – fell ill of a severe and complicated hysteria (accompanied by paralyses, contractures, disturbances of speech and vision, and psychical peculiarities of every kind), while she was nursing her sick father.[1] This case will retain an important place in the history of hysteria, since it was the first one in which a physician succeeded in elucidating all the symptoms of the hysterical state, in learning the origin of each symptom [30] and at the same time in finding a means of causing that symptom to disappear. We may say that it was the first case of hysteria to be made intelligible. Dr Breuer kept back the conclusions which followed from this case till he could be certain that it did not stand alone. After I returned, in 1886, from a course of study under Charcot,[2] I began, with Breuer's constant cooperation, to make close observations on a fairly large number of hysterical patients and to examine them from this point of view; and I found that the behaviour of this first patient had in fact been typical and that the inferences which were justified by that case could be carried over to a considerable number of hysterical patients, if not to all.

Our material consisted of cases of common, that is of non-traumatic, hysteria. Our procedure was to take each separate symptom and enquire

1 [This was, of course, Fräulein Anna O., of Case History 1 in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 19 ff.]

2 [Freud spent the winter of 1885–6 in Paris working at the Salpêtrière.]

into the circumstances in which it had made its first appearance; and we endeavoured in this way to arrive at a clear idea of the precipitating cause which might perhaps have determined that symptom. Now you must not suppose that this is a simple job. If you question patients along these lines, you will as a rule receive no answer at all to begin with. In a small group of cases the patients have their reasons for not saying what they know. But in a greater number of cases the patients have no notion of the context of their symptoms. The method by which something can be learnt is an arduous one. It is as follows. The patients must be put under hypnosis and then questioned as to the origin of some particular symptom – as to when it first appeared and what they remember in that connection. While they are in this state, the memory, which was not at their disposal in a waking state, returns. We have learnt in this manner that, to put it roughly, there is an affectively coloured experience behind most, if not all, phenomena of hysteria; and further, that this experience is of such a kind that it at once makes the symptom to which it relates intelligible and shows accordingly that the symptom, once again, is unambiguously determined. If you will allow me to equate this affectively coloured experience with the major traumatic experience underlying traumatic hysteria, I can at once formulate the first thesis at
[31] which we have arrived: '*There is a complete analogy between traumatic paralysis and common, non-traumatic hysteria.*' The only difference is that in the former a major trauma has been operative, whereas in the latter there is seldom a *single* major event to be signalized, but rather a *series* of affective impressions – a whole story of suffering. But there is nothing forced in equating such a story, which appears as the determining factor in hysterical patients, with the accident which occurs in traumatic hysteria. For no-one doubts any longer today that even in the case of the major mechanical trauma in traumatic hysteria what produces the result is not the mechanical factor but the affect of fright [*Schreckaffekt*], the *psychical* trauma. The first thing that follows from all this, then, is that the pattern of traumatic hysteria, as it was laid down by Charcot for hysterical paralyses, applies quite generally to all hysterical phenomena, or at least to the great majority of them. In every case what we have to deal with is the operation of psychical traumas, which unambiguously determine the nature of the symptoms that arise.

I will now give you a few instances of this. First, here is an example of the occurrence of contractures. Throughout the whole period of her illness, Breuer's patient, whom I have already mentioned, exhibited a

contracture of the right arm. It emerged under hypnosis that at a time before she had fallen ill she was subjected to the following trauma. She was sitting half-dozing at the bedside of her sick father; her right arm was hanging over the back of her chair and went to sleep. At this moment she had a terrifying hallucination; she tried to fend it off with her arm but was unable to do so. This gave her a violent fright, and for the time being the matter ended there. It was not until the outbreak of her hysteria that the contracture of the arm set in.[1] In another woman patient, I observed that her speech was interrupted by a peculiar 'clacking' with her tongue, which resembled the cry of a capercaillie.[2] I had been familiar with this symptom for months and regarded it as a tic. It was only after I once hap- [32]
pened to question her under hypnosis about its origin that I discovered that the noise had first appeared on two occasions. On each of these she had made a firm decision to keep absolutely quiet. This happened once when she was nursing a child of hers who was seriously ill. (Nursing sick people often plays a part in the aetiology of hysteria.) The child had fallen asleep and she was determined not to make any noise that might wake it. But fear that she might make a noise turned into actually making one – an instance of 'hysterical counterwill' [*Gegenwille*];[3] she pressed her lips together and made the clacking noise with her tongue. Many years later the same symptom had arisen a second time, once again when she had made a decision to be absolutely quiet, and it had persisted ever afterwards. A single precipitating cause is often not enough to fixate [*fixieren*][T] a symptom; but if this same symptom appears several times accompanied by a particular affect, it becomes fixated and chronic.

One of the commonest symptoms of hysteria is a combination of anorexia and vomiting. I know of a whole number of cases in which the occurrence of this symptom is explained quite simply. Thus in one patient vomiting persisted after she had read a humiliating letter just before a meal and had been violently sick after it. In other cases disgust at food could be quite definitely related to the fact that, owing to the institution of the 'common table', a person may be compelled to eat his meal with someone he detests. The disgust is then transferred from the person to the food. The woman with the tic whom I have just mentioned was

1 [For a fuller account of this, see *RSE*, **2**, 35–6.]

2 [This was Frau Emmy von N., of Case History 2 in the *Studies*. – An ornithologist describes the capercaillie's cry as 'a ticking ending with a pop and a hiss' (Fisher, 1955, **3**, 46). – This particular symptom is accounted for at greater length in *RSE*, **2**, 49 and 53.]

3 [Freud had very recently published a paper discussing this phenomenon and this same example of it: 'A Case of Successful Treatment by Hypnotism' (1892–93*a*), ibid., **1**, 145 ff. – Some comments on Freud's use of the term 'to fixate', which appears just below, can be found in an Editors' footnote towards the end of this same paper (ibid., 152 f. *n*.). See also ibid., **24**, 67.]

particularly interesting in this respect. She ate uncommonly little and only under pressure. I learnt from her in hypnosis that a series of psychical traumas had eventually produced this symptom of disgust at food.[1] While she was still a child, her mother, who was very strict, insisted on her eating any meat she had left over at her midday meal two hours later,
[33] when it was cold and the fat was all congealed. She did so with great disgust and retained the memory of it; so that later on, when she was no longer subjected to this punishment, she regularly felt disgust at mealtimes. Ten years later she used to sit at table with a relative who was tubercular and kept constantly spitting across the table into the spittoon during meals. A little while later she was obliged to share her meals with a relative who, as she knew, was suffering from a contagious disease. Breuer's patient, again, behaved for some time like someone suffering from hydrophobia. During hypnosis it turned out that she had once unexpectedly seen a dog drinking out of a tumbler of water of hers.[2]

Sleeplessness or disturbed sleep are also symptoms that are usually susceptible to the most precise explanation. Thus, for years on end a woman could never get to sleep till six in the morning. She had for a long time slept in the room adjoining her sick husband, who used to rise at six o'clock. After that hour she had been able to sleep in quiet; and she behaved in the same way once more many years later during a hysterical illness. Another case was that of a man. He was a hysterical patient who had slept very badly for the last twelve years. His sleeplessness, however, was of a quite special sort. In the summer he slept excellently, but in the winter very badly; and in November he slept quite particularly badly. He had no notion what this was due to. Enquiry revealed that in November twelve years earlier he had watched for many nights at the bedside of his son, who was ill with diphtheria.

Breuer's patient, to whom I have so often referred, offered an example of a disturbance of speech. For a long period of her illness she spoke only English and could neither speak nor understand German. This symptom was traced back to an event which had happened before the outbreak of her illness. While she was in a state of great anxiety, she had attempted to pray but could find no words. At last a few words of a child's prayer in English occurred to her. When she fell ill later on, only the English language was at her command.[3]

1 [Cf. *RSE*, **2**, 71–3.]

2 [This was in fact the first symptom ever to be removed by catharsis; and the procedure was initiated by the patient herself spontaneously. See ibid., **2**, 31–2.]

3 [Cf. ibid., **2**, 35–6.]

The determination of the symptom by the psychical trauma is not so transparent in every instance. There is often only what may be described [34]
as a 'symbolic' relation between the determining cause and the hysterical symptom. This is especially true of pains. Thus one patient[1] suffered from piercing pains between her eyebrows. The reason was that once when she was a child her grandmother had given her an enquiring, 'piercing' look. The same patient suffered for a time from violent pains in her right heel, for which there was no explanation. These pains, it turned out, were connected with an idea that occurred to the patient when she made her first appearance in society. She was overcome with fear that she might not 'find herself on a right footing'. Symbolizations of this kind were employed by many patients for a whole number of so-called neuralgias and pains. It is as though there were an intention to express the mental state by means of a physical one; and linguistic usage affords a bridge by which this can be effected. In the case, however, of what are after all the typical symptoms of hysteria – such as hemianaesthesia, restriction of the visual field, epileptiform convulsions, etc. – a psychical mechanism of this sort cannot be demonstrated. On the other hand, this can often be done in respect to the hysterogenic zones.

These examples, which I have chosen out of a number of observations, seem to offer proof that the phenomena of common hysteria can safely be regarded as being on the same pattern as those of traumatic hysteria, and that accordingly every hysteria can be looked upon as traumatic hysteria in the sense of implying a psychical trauma and that every hysterical phenomenon is determined by the nature of the trauma.

The further question which would then have to be answered is as to the nature of the causal connection between the determining factor which we have discovered during hypnosis and the phenomenon which persists subsequently as a chronic symptom. This connection might be of various kinds. It might be of the type that we should describe as a 'releasing' factor. For instance, if someone with a disposition to tuberculosis receives a blow on the knee as a result of which he develops a tubercular inflammation of the joint, the blow is a simple releasing cause. But this is not what [35]
happens in hysteria. There is another kind of causation – namely, *direct* causation. We can elucidate this from the picture of a foreign body, which continues to operate unceasingly as a stimulating cause of illness

1 [This was Frau Cäcilie M., whose 'symbolic' symptoms are discussed at the end of Case History 5 in the *Studies*. Cf. *RSE*, **2**, 156–60.]

until it is got rid of. *Cessante causa cessat effectus*.[1] Breuer's observation shows us that there is a connection of this latter kind between the psychical trauma and the hysterical phenomenon. For Breuer learnt from his first patient that the attempt at discovering the determining cause of a symptom was at the same time a therapeutic manoeuvre. The moment at which the physician finds out the occasion when the symptom first appeared and the reason for its appearance is also the moment at which the symptom vanishes. When, for instance, the symptom presented by the patient consists in pains, and when we enquire from him under hypnosis as to their origin, he will produce a series of memories in connection with them. If we can succeed in eliciting a really vivid memory in him, and if he sees things before him with all their original actuality, we shall observe that he is completely dominated by some affect. And if we then compel him to put this affect into words, we shall find that, at the same time as he is producing this violent affect, the phenomenon of his pains emerges very markedly once again and that thenceforward the symptom, in its chronic character, disappears. This is how events turned out in all the instances I have quoted. And it was an interesting fact that the memory of this particular event was to an extraordinary degree more vivid than the memory of any others, and that the affect accompanying it was as great, perhaps, as it had been when the event actually occurred. It could only be supposed that the psychical trauma does in fact continue to operate in the subject and maintains the hysterical phenomenon, and that it comes to an end as soon as the patient has spoken about it.

As I have just said, if, in accordance with our procedure, one arrives at the psychical trauma by making enquiries from the patient under hypnosis, one discovers that the memory concerned is quite unusually strong and has retained the whole of its affect. The question now arises how it is that an event which occurred so long ago – perhaps ten or twenty years – can persist in exercising its power over the subject, how it is that these
[36] memories have not been subject to the processes of wearing away and forgetting.

With a view to answering this question, I should like to begin with a few remarks on the conditions which govern the wearing away of the contents of our ideational life. We will start from a thesis that may be stated in the following terms. If a person experiences a psychical impression, something in his nervous system which we will for the moment call
Erregung the sum of excitation[2] [*Erregungssumme*][T] is increased. Now in every

1 ['When the cause ceases the effect ceases.']

2 [Cf. an Editors' footnote, p. 46 *n.* 1 below.]

individual there exists a tendency to diminish this sum of excitation once more, in order to preserve his health.[1] The increase of the sum of excitation takes place along sensory paths, and its diminution along motor ones. So we may say that if anything impinges on someone he reacts in a motor fashion. We can now safely assert that it depends on this reaction how much of the initial psychical impression is left. Let us consider this in relation to a particular example. Let us suppose that a man is insulted, is given a blow or something of the kind. This psychical trauma is linked with an increase in the sum of excitation of his nervous system. There then instinctively [*instinktiv*][T] arises an inclination to diminish this increased excitation immediately. He hits back, and then feels easier; he may perhaps have reacted adequately – that is, he may have got rid of as much as had been introduced into him. Now this reaction may take various forms. For quite slight increases in excitation, alterations in his own body may perhaps be enough: weeping, abusing, raging, and so on. The more intense the trauma, the greater is the adequate reaction. The most adequate reaction, however, is always a deed. But, as an English writer has wittily remarked, the man who first flung a word of abuse at his enemy instead of a spear was the founder of civilization[2] [*Zivilisation*][T]. Thus words are substitutes for deeds, and in some circumstances (e.g. in Confession) the only substitutes. Accordingly, alongside the adequate reaction there is one that is less adequate. If, however, there is no reaction *whatever* to a psychical trauma, the memory of it retains the affect[3] which it originally had. So that if someone who has been insulted cannot avenge the insult either by a retaliatory blow or by a word of abuse, the possibility arises that the memory of the event may call up in him once more the affect which was originally present. An insult that has been repaid, even if only in words, is recollected quite differently from one that has had to be accepted; and linguistic usage characteristically describes an insult that has been suffered in silence as a 'mortification' ['*Kränkung*', literally 'making ill']. Thus, if for any reason there can be no reaction to a psychical trauma, it retains its original affect, and when someone cannot get rid of the accretion of stimulus by 'abreacting'[4] it,

Instinkt

[37]

1 [Here was a tentative statement of the 'principle of constancy'. See the Editors' Appendix to 'The Neuropsychoses of Defence' (1894*a*), p. 59 below.]

2 [As Andersson (1962, 109–10) has pointed out, this is an allusion to a phrase by Hughlings Jackson. Freud (1905*c*) quotes a similar remark by Lichtenberg (*RSE*, **8**, 90).]

3 [This is printed '*Effekt*' ('effect') in the original German here and again seventeen lines further on. These are almost certainly misprints for '*Affekt*'.]

4 [The term was introduced in the 'Preliminary Communication' (1893*a*), ibid., **2**, 8. See ibid., **1**, 199 *n*. 1.]

we have the possibility of the event in question remaining a psychical trauma. Incidentally, a healthy psychical mechanism has other methods of dealing with the affect of a psychical trauma even if motor reaction
Versagung and reaction by words are denied [*versagt*][T] to it – namely by working it over associatively and by producing contrasting ideas. Even if the person who has been insulted neither hits back nor replies with abuse, he can nevertheless reduce the affect attaching to the insult by calling up such contrasting ideas as those of his own worthiness, of his enemy's worthlessness, and so on. Whether a healthy man deals with an insult in one way or the other, he always succeeds in achieving the result that the affect which was originally strong in his memory eventually loses intensity and that finally the recollection, having lost its affect, falls victim to forgetfulness and the process of wearing away.[1]

Now we have found that in hysterical patients there are nothing but impressions which have not lost their affect and whose memory
[38] has remained vivid. It follows, therefore, that these memories in hysterical patients, which have become pathogenic, occupy an exceptional position as regards the wearing-away process; and observation shows that, in the case of all the events which have become determinants of hysterical phenomena, we are dealing with psychical traumas which have not been completely abreacted, or completely dealt with. Thus we may assert that *hysterical patients suffer from incompletely abreacted psychical traumas.*

We find two groups of conditions under which memories become pathogenic.[2] In the first group the memories to which the hysterical phenomena can be traced back have for their content ideas which involved a trauma so great that the nervous system had not sufficient power to deal with it in any way, or ideas to which reaction was impossible for social reasons (this applies frequently to married life); or lastly the subject may simply refuse to react, may not *want* to react to the psychical trauma. In this last case the contents of the hysterical deliria often turn out to be the very circle of ideas which the patient in his normal state has rejected, inhibited and suppressed with all his might. (For instance, blasphemies and erotic ideas occur in the hysterical deliria of

1 [In Section 3 of Part III of his 'Project for a Scientific Psychology', written in 1895, soon after this, Freud gave a most elaborate account of the mechanism by which what he there termed an 'untamed' memory is turned into a 'tamed' one. (Freud, 1950*a*; *RSE*, **1**.) Cf. also a footnote added in 1907 to the last chapter of *The Psychopathology of Everyday Life* (1901*b*), ibid., **6**, 235 f. *n.* 3.]

2 [These two groups were to lead to the main division between the views of Breuer and Freud. The first group implied Freud's notion of 'defence', which became the basis of all his later work, while he very soon rejected the Breuer hypothesis of 'hypnoid states'.]

nuns.) But in a second group of cases the reason for the absence of a reaction lies not in the content of the psychical trauma but in other circumstances. For we very often find that the content and determinants of hysterical phenomena are events which are in themselves quite trivial, but which have acquired high significance from the fact that they occurred at specially important moments when the patient's predisposition was pathologically increased. For instance, the affect of fright may have arisen in the course of some other severe affect and may on that account have attained such great importance. States of this kind are of short duration and are, as one might say, out of communication with the rest of the subject's mental life. While he is in a state of autohypnosis such as this, he cannot get rid associatively of an idea that occurs to him, as he can in a waking state. After considerable experience with these phenomena, we think it probable that in every hysteria we are dealing with a [39]
rudiment of what is called [in French] '*double conscience*', dual consciousness, and that a tendency to such a dissociation and with it the emergence of abnormal states of consciousness, which we propose to call 'hypnoid', is the basic phenomenon of hysteria.

Let us now consider the manner in which our therapy operates. It falls in with one of the dearest human wishes – the wish to be able to do something over again. Someone has experienced a psychical trauma without reacting to it sufficiently. We get him to experience it a second time, but under hypnosis; and we now compel him to complete his reaction to it. He can then get rid of the idea's affect, which was so to say 'strangulated', and when this is done the operation of the idea is brought to an end. Thus we cure – not hysteria but some of its individual symptoms – by causing an unaccomplished reaction to be completed.

You must not suppose, then, that very much has been gained by this for the therapeutics of hysteria. Hysteria, like the neuroses,[1] has its deeper causes; and it is those deeper causes that set limits, which are often very appreciable, to the success of our treatment.

1 [At this period Freud often used the term 'neuroses' to denote neurasthenia and what he was later to describe as anxiety neurosis.]

Included (no. XXIX) in Freud's own collection of abstracts of his early works (1897*b*). The present translation is a revised and corrected reprint of the *SE* version.

When Freud finished this paper in January, 1894, a year had elapsed since the appearance of his last psychopathological work – the 'Preliminary Communication', written jointly with Breuer. The only exceptions were the paper on hysterical paralyses, planned and drafted years earlier, the Charcot obituary, and the lecture reported above. (A second lecture before the same audience, 'On Hysterical Paralysis' (1893*i*), was reported second-hand and is not included in the *RSE*.) Another year was to elapse before any more were to appear. Yet the years 1893 and 1894 were far from idle. In 1893 Freud was still producing a quantity of neurological work, while in 1894 he was preparing his contributions to *Studies on Hysteria*. But throughout both these years, as we can see from his letters to Fliess, he was deeply engaged in investigating what had now completely ousted neurology from his focus of interest – the problems of the neuroses. These problems fell into two fairly distinct groups, concerned respectively with what were later (p. 273 below) to become known as the 'actual [44]
neuroses' and the 'psychoneuroses'. Freud was not prepared to publish anything about the former – neurasthenia and states of anxiety – for another year, till the

beginning of 1895. But on hysteria and obsessions he was already able to map out the ground, and the present paper was the result.[1]

Here, of course, he was still deeply indebted to Charcot and to Breuer; but nevertheless it is possible to detect too a first emergence of much that was to become an essential part of Freud's own views. For instance, though the theory of defence was very briefly mentioned in the 'Preliminary Communication', it is extensively discussed for the first time here. The term 'defence' itself occurs here for the first time (p. 45 below) and so too do 'conversion' (p. 46) and 'flight into psychosis' (p. 55).[2] The importance of the part played by sexuality begins to emerge (p. 49); the question of the nature of the 'unconscious' is touched on (p. 49 f.). Most important of all, perhaps, the whole fundamental theory of cathexis and its displaceability is raised in the second section, and the hypothesis on which Freud's scheme was based is clearly enunciated in the penultimate paragraph of the paper. A fuller discussion of the first emergence of Freud's fundamental theoretical views appears in the Editors' Appendix to this paper, p. 57 ff. below.

1 A list of Freud's principal writings dealing with conversion hysteria can be found at the end of *Studies on Hysteria*, *RSE*, **2**, 311. A similar list of his writings on obsessional neurosis is given in ibid., **10**, 241.

2 The phrase 'flight into illness' seems to have appeared first in a paper on hysterical attacks (1909*a*), ibid., **9**, 203.

THE NEUROPSYCHOSES[t] OF DEFENCE

An attempt at a psychological theory of acquired hysteria, of many phobias and obsessions[I] *and of certain hallucinatory psychoses*

After making a detailed study of a number of nervous patients suffering [45]
from phobias and obsessions, I was led to attempt an explanation of those symptoms; and this enabled me afterwards to arrive successfully at the origin of pathological ideas [*Vorstellungen*][T] of this sort in new and different cases. My explanation therefore seems to me to deserve publication and further examination. Simultaneously with this 'psychological theory of phobias and obsessions' my observation of patients resulted in a contribution to the theory of hysteria, or rather to a change in it, which appears to take into account an important characteristic that is common both to hysteria and to the neuroses I have just mentioned. Furthermore, I had occasion to gain insight into what is undoubtedly a form of mental disease, and I found at the same time that the point of view which I had tentatively adopted established an intelligible connection between these psychoses and the two neuroses under discussion. At the end of this paper I shall bring forward a working hypothesis which I have made use of in all three instances.

I

Let me begin with the change which seems to me to be called for in the theory of the hysterical neurosis.

Since the fine work done by Pierre Janet, Josef Breuer and others, it may be taken as generally recognized that the syndrome of hysteria, so far as it is as yet intelligible, justifies the assumption of there being a [46]
splitting of consciousness [*Bewusstseinsspaltung*], accompanied by the formation [*Bildung*][T] of separate psychical groups.[2] Opinions are less

1 [Cf. some remarks on the translation of the German term '*Zwangsvorstellung*' (which Freud uses here for the first time) in the Editors' Note to 'Obsessions and Phobias', p. 66 below. See also *RSE*, **24**, 98–9.]

2 [The concept of 'psychical groups' was much employed by Freud at this period. See, for instance, the case history of Frau Emmy von N. in *Studies on Hysteria* (1895*d*), ibid., **2**, 92. It is

settled, however, about the origin of this splitting of consciousness and about the part played by this characteristic in the structure [*Gefüge*][T] of the hysterical neurosis.

According to the theory of Janet (1892, 1894 and 1893), the splitting of consciousness is a primary feature of the mental change in hysteria. It is based on an innate weakness of the capacity for psychical synthesis, on the narrowness of the 'field of consciousness (*champ de la conscience*)' which, in the form of a psychical stigma, is evidence of the degeneracy of hysterical individuals.

In contradistinction to Janet's view, which seems to me to admit of a great variety of objections, there is the view put forward by Breuer in our joint communication (Breuer & Freud, 1893). According to him, 'the basis and *sine qua non* of hysteria' is the occurrence of peculiar dreamlike states of consciousness with a restricted capacity for association [*Assoziationsfähigkeit*], for which he proposes the name 'hypnoid states'. In that case, the splitting of consciousness is secondary and acquired; it comes about because the ideas which emerge in hypnoid states are cut off from associative communication with the rest of the content of consciousness.[1]

I am now in a position to bring forward evidence of two other extreme forms of hysteria in which it is impossible to regard the splitting of consciousness as primary in Janet's sense. In the first of these [two extreme] forms I was repeatedly able to show that *the splitting of the content of consciousness is the result of an act of will on the part of the patient*; that is to say, it is initiated by an effort of will whose motive can be specified. By this I do not, of course, mean that the patient intends to bring about a
[47] splitting of his consciousness. His intention is a different one; but, instead of attaining its aim, it produces a splitting of consciousness.

In the third form of hysteria, which we have demonstrated by means of a psychical analysis[2] of intelligent patients, the splitting of consciousness plays an insignificant part, or perhaps none at all. They are those cases in which what has happened is only that the reaction to traumatic

interesting to note that elsewhere in the same work (ibid., **2**, 62 *n.*) he makes use of the term 'complex' in apparently the same sense. Cf. some remarks on the history of that term in the Editors' Note to 'Psychoanalysis and the Establishment of the Facts in Legal Proceedings' (1906*c*), ibid., **9**, 79–80.]

1 [*RSE*, **2**, 11.]

2 [The term 'to analyse' had already appeared in the 'Preliminary Communication' (1893*a*), ibid., **2**, 7. This is the first appearance of 'psychical analysis'; 'clinico-psychological analysis' occurs on p. 50 below; 'hypnotic analysis' on p. 55; 'psychological analysis' on p. 68. 'Psychoanalysis' first appears in the French paper on the aetiology of the neuroses (1896*a*), p. 160 below.]

stimuli has failed to occur, and which can also, accordingly, be resolved and cured by 'abreaction'.[1] These are the pure 'retention hysterias'.

As regards the connection with phobias and obsessions, I am only concerned with the second form of hysteria. For reasons which will soon be evident, I shall call this form '*defence* hysteria' [*Abwehrhysterie*]^{T}, *Abwehr* using the name to distinguish it from *hypnoid* hysteria and *retention* hysteria.[2] I may also provisionally present my cases of defence hysteria as 'acquired' hysteria, since in them there was no question either of a grave hereditary taint or of an individual degenerative atrophy.

For these patients whom I analysed had enjoyed good mental health up to the moment at which *an occurrence of incompatibility* [*Unverträglichkeit*] *took place in their ideational life* – that is to say, until their ego [*Ich*]^{T} was faced with an experience, an idea or a feeling which aroused such a distressing affect that the subject [*Person*]^{T} decided to forget about it because he had no confidence in his power to resolve the contradiction between that incompatible idea and his ego by means of thought activity.

In females incompatible ideas of this sort arise chiefly on the soil of sexual experience and sensation; and the patients can recollect as precisely as could be desired their efforts at defence, their intention of 'pushing the thing away', of not thinking of it, of suppressing it. I will give some examples, which I could easily multiply, from my own obser- [48] vation: the case of a girl, who blamed herself because, while she was nursing her sick father, she had thought about a young man who had made a slight erotic impression on her; the case of a governess who had fallen in love with her employer and had resolved to strike this inclination out of her mind because it seemed to her incompatible with her pride; and so on.[3]

I cannot, of course, maintain that an effort of will to thrust things of this kind out of one's thoughts is a pathological act; nor do I know whether and in what way intentional forgetting succeeds in those people who, under the same psychical influences, remain healthy. I only know that this kind of 'forgetting' did not succeed with the patients I analysed, but led to various pathological reactions which produced either hysteria or an obsession or a hallucinatory psychosis. The ability

1 Cf. our joint communication, *RSE*, **2**, 7–8.

2 [Cf. *Studies on Hysteria* (1895*d*), ibid., **2**, 188 and 254–5. This is the first appearance of the term 'defence', though the concept had already occurred in the 'Preliminary Communication' (1893*a*), ibid., **2**, 9.]

3 These examples are taken from a volume by Breuer and myself which is still in preparation and which deals in detail with the psychical mechanism of hysteria. [*Studies on Hysteria* was published in the year after the present paper. The first of the cases mentioned here is that of Fräulein Elisabeth von R. (ibid., **2**, 120 ff.); the second is that of Miss Lucy R. (ibid., 94 ff.).]

to bring about one of these states – which are all of them bound up with a splitting of consciousness – by means of an effort of will of this sort, is to be regarded as the manifestation of a pathological disposition, although such a disposition is not necessarily identical with individual or hereditary 'degeneracy'.

As regards the path which leads from the patient's effort of will to the onset of the neurotic symptom, I have formed an opinion which may be expressed, in current psychological abstractions, somewhat as follows. The task which the ego, in its defensive attitude, sets itself of treating the incompatible idea as '*non arrivée*' simply cannot be fulfilled by it. Both the memory trace and the affect which is attached to the idea are there once and for all and cannot be eradicated. But it amounts to an approximate fulfilment of the task if the ego succeeds in *turning this powerful idea into a weak one*, in robbing it of the affect – the sum of excitation [*Erregungssumme*][T] – with which it is loaded.[1] The weak idea will then have virtually no demands to make on the work of association. *But the sum of excitation which has been detached from it must be put to another use*.

Erregung [49]

Up to this point the processes in hysteria, and in phobias and obsessions are the same; from now on their paths diverge. In hysteria, the incompatible idea is rendered innocuous by its *sum of excitation* being *transformed into something somatic*. For this I should like to propose the name of *conversion*.[2]

The conversion may be either total or partial. It proceeds along the line of the motor or sensory innervation[3] which is related – whether intimately or more loosely – to the traumatic experience. By this means the ego succeeds in freeing itself from the contradiction [with which it is confronted]; but instead, it has burdened itself with a mnemic symbol[4]

1 [This metaphor (in German '*behaftet*') is one of several (e.g. '*ausgestattet*' 'supplied' on p. 50 below) that were before long to give place to the familiar standard term '*besetzt*' (cathected). See the Editors' Appendix at the end of the present paper, p. 57 f. below. – This seems to be the first published use by Freud of the term 'sum of excitation', though it had appeared in the shorthand report of his lecture of January 11, 1893 (Freud, 1893*h*, p. 34 above). It occurs in a posthumously published letter to Breuer of June 29, 1892 (Freud, 1941*a*) and in a draft of the 'Preliminary Communication' written in November of the same year (Freud, 1940*d*). The underlying concept is discussed in the last paragraph but one of the present paper and in the Editors' Appendix, p. 60 f. below.]

2 [This is the first appearance of the term. See some remarks by Freud on the origin of the concept in his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 6–7.]

3 ['*Innervation*.' From 1911 onwards, this word was misprinted '*Intervention*' in all the German editions.]

4 [*Erinnerungssymbol*. The term (here first introduced) was employed frequently by Freud in his early writings. The best explanation of it, however, is from a later work – the first of his *Five Lectures* (1910*a*), ibid., **11**, 17–18.]

which finds a lodgement in consciousness, like a sort of parasite, either in the form of an unresolvable motor innervation or as a constantly recurring hallucinatory sensation, and which persists until a conversion in the opposite direction takes place. Consequently the memory trace of the repressed[I] idea has, after all, not been dissolved; from now on, it forms the nucleus of a second psychical group.

I will add only a few more words to this view of the psychophysical processes in hysteria. When once such a nucleus for a hysterical splitting off has been formed at a 'traumatic moment',[2] it will be increased at other moments (which might be called 'auxiliary moments') whenever the arrival of a fresh impression of the same sort succeeds in breaking through the barrier erected by the will, in furnishing the weakened idea with fresh affect and in re-establishing for a time the associative link between the two psychical groups, until a further conversion sets up a defence. The distribution of excitation thus brought about in hysteria usually turns out to be an unstable one. The excitation which is forced into a wrong channel (into somatic innervation) now and then finds its way back to the idea from which it has been detached, and it then compels the subject either to work over the idea associatively or to get rid of it in hysterical attacks – as we see in the familiar contrast between attacks and chronic symptoms. The operation of Breuer's cathartic method lies in leading back the excitation in this way from the somatic to the psychical sphere deliberately, and in then forcibly bringing about a settlement of the contradiction by means of thought activity and a discharge [*Abfuhr*][T] of the excitation by talking. [50] *abführen*

If the splitting of consciousness which occurs in acquired hysteria is based upon an act of will, then we have a surprisingly simple explanation of the remarkable fact that hypnosis regularly widens the restricted consciousness of a hysteric and allows access to the psychical group that has been split off. Indeed, we know it as a peculiarity of all states resembling sleep that they suspend the distribution of excitation on which the 'will' of the conscious personality is based.

Thus we see that the characteristic factor in hysteria is not the splitting of consciousness but *the capacity for conversion*, and we may adduce as an important part of the disposition to hysteria – a disposition which

1 [*verdrängten.* The concept and the term 'repression' were already present in the 'Preliminary Communication' (1893*a*), *RSE*, **2**, 9. See ibid., **24**, 90–1.]

2 ['*Moment*', the German word used here (and in many parallel passages), is the masculine word meaning 'moment of time'. It has been mistaken for the neuter '*das Moment*' and rendered by the English 'factor' in some previous translations.]

in other respects is still unknown – a psychophysical aptitude for transposing very large sums of excitation into the somatic innervation.

This aptitude does not, in itself, exclude psychical health; and it only [51] leads to hysteria in the event of there being a psychical incompatibility or an accumulation of excitation. In taking this view, Breuer and I are coming closer to Oppenheim's[1] and Strümpell's[2] well-known definitions of hysteria, and are diverging from Janet, who assigns too great an importance to the splitting of consciousness in his characterization of hysteria.[3] The presentation given here may claim to have made intelligible the connection between conversion and the hysterical splitting of consciousness.

II

If someone with a disposition [to neurosis] lacks the aptitude for conversion, but if, nevertheless, in order to fend off an incompatible[4] idea, [52] he sets about separating it from its affect, then *that affect is obliged to remain in the psychical sphere*. The idea, now weakened, is still left in consciousness, separated from all association. *But its affect, which has*

1 According to Oppenheim [1890], hysteria is an intensified expression of emotion. The 'expression of emotion', however, represents the amount of psychical excitation which normally undergoes conversion. [This approach to the views of Oppenheim and Strümpell is probably attributable to Breuer, who quotes both these definitions with apparent approval in his contribution to *Studies on Hysteria*, *RSE*, **2**, 218. Two or three years later, Freud dissociated himself from Oppenheim's remark in a letter to Fliess of December 6, 1896 (Freud, 1950*a*, Letter 52).]

2 Strümpell maintains that in hysteria the disturbance lies in the psychophysical sphere – in the *Seele* region where the somatic and the mental [*Seelisches*][T] are linked together. [Strümpell, 1892.]

3 In the second section of his acute paper 'Quelques définitions . . .' Janet [1893] has himself dealt with the objection which argues that splitting of consciousness occurs in psychoses and in so-called 'psychasthenia' as well as in hysteria, but in my judgement he has not met it satisfactorily. It is in the main this objection which obliges him to describe hysteria as a form of degeneracy. But he has failed to produce any characteristic which sufficiently distinguishes the splitting of consciousness in hysteria from that in psychoses and similar states.

4 ['*unverträglich* (incompatible)' in the original publication of 1894. Misprinted '*unerträglich* (intolerable)' in all the later German reprints. The same misprint seems to have occurred at three other points later in this paper, though in *two* of these the misprint (if it is one) has already been made in the original. The term is used a very great number of times in Freud's writings of this period – and invariably, except in these instances, as '*unverträglich*'. The view that this was what Freud intended is confirmed by the fact that he himself translated the word into French as '*inconciliable*' (see p. 66 below). Nevertheless, in the *Collected Papers* version of the present paper it is translated 'unbearable' throughout. Though no doubt the two words roughly imply the same meaning, they give rather different pictures of the psychological situation, a difference which it seems desirable to preserve. It must, however, be noted that '*unerträglich*' reappears twice ten years later, in a paper first printed in a book by Löwenfeld (Freud, 1906*a*), *RSE*, **7**, 285, again possibly as a misprint.]

become free,[1] *attaches itself to other ideas which are not in themselves incompatible; and, thanks to this 'false connection', those ideas turn into obsessional ideas*.[2] This, in a few words, is the psychological theory of obsessions and phobias mentioned at the beginning of this paper.

I will now indicate which of the various elements put forward in this theory can be directly demonstrated and which have been filled in by me. What can be directly demonstrated, apart from the end product of the process – the obsession – is in the first place the source of the affect which is now in a false connection. In all the cases I have analysed it was the subject's *sexual life* that had given rise to a distressing affect of precisely the same quality as that attaching to his obsession. Theoretically, it is not impossible that this affect should sometimes arise in other fields; I can only report that so far I have not come across any other origin. Moreover, it is easy to see that it is precisely sexual life which brings with it the most copious occasions for the emergence of incompatible ideas.

Furthermore, the most unambiguous statements by the patients give proof of the effort of will, the attempt at defence, upon which the theory lays emphasis; and at least in a number of cases the patients themselves inform us that their phobia or obsession made its first appearance after the effort of will had apparently succeeded in its aim. 'Something very disagreeable happened to me once and I tried very hard to put it away from me and not to think about it any more. I succeeded at last; but then [53]
I got this other thing, which I have not been able to get rid of since.' It was with these words that a woman patient confirmed the chief points of the theory I have developed here.

Not everyone who suffers from obsessions is as clear as this about their origin. As a rule, when one draws a patient's attention to the original idea of a sexual kind, the answer is: 'It can't come from that. I didn't think at all much about that. For a moment I was frightened, but I turned my mind away from it and I haven't been troubled by it since.' In this frequent objection we have evidence that the obsession represents a substitute or surrogate for the incompatible sexual idea and has taken its place in consciousness.

Between the patient's effort of will, which succeeds in repressing the unacceptable sexual idea, and the emergence of the obsessional idea,

1 [See Editors' Appendix, p. 59 *n*. 1 below.]

2 [A long discussion of 'false connections' can be found in a footnote to the case of Frau Emmy von N. in *Studies on Hysteria*, *RSE*, **2**, 60–3. See also ibid., **2**, 269–70. The term reappears in the 'Rat Man' case history (1909*d*), ibid., **10**, 135, where an account of displacement of affect is given very much like the present one. – The divergent vicissitudes of the idea and the affect attached to it foreshadow the account of repression in the metapsychological papers (1915*d*), ibid., **14**, 134–6.]

which, though having little intensity in itself, is now supplied [p. 46 *n.* 1 above] with an incomprehensibly strong affect, yawns the gap which the theory here developed seeks to fill. The separation of the sexual idea from its affect and the attachment of the latter to another, suitable but not incompatible idea – these are processes which occur without consciousness. Their existence can only be presumed, but cannot be proved by any clinico-psychological analysis [cf. p. 44 *n.* 2]. Perhaps it would be more correct to say that these processes are not of a psychical nature at all, that they are physical processes whose psychical consequences present themselves as if what is expressed by the terms 'separation of the idea from its affect' and 'false connection' of the latter had really taken place.[1]

Alongside of the cases which show a sequence between an incompatible sexual idea and an obsessional idea, we find a number of other cases in which obsessional ideas and sexual ideas of a distressing character are present simultaneously. To call the latter 'sexual obsessional ideas' will not do very well, for they lack one essential feature of obsessional ideas: they turn out to be fully justified, whereas the distressing character of ordinary obsessional ideas is a problem for both doctor and patient. So far as I have been able to see my way in cases of this kind, what is happening is that a perpetual defence is going on against sexual ideas that are [54] continually coming up afresh – a piece of work, that is to say, which has not yet come to completion.

So long as the patients are aware of the sexual origin of their obsessions, they often keep them secret. If they do complain about them, they usually express their astonishment that they should be subject to the affect in question – that they should feel anxiety, or have certain impulses, and so on. To the experienced physician, on the contrary, the affect seems justified and comprehensible; what *he* finds noticeable is only that an affect of that kind should be linked with an idea which does not merit it. The affect of the obsession appears to him, in other words, as being *dislodged* or *transposed*;[2] and if he has accepted what has been said in these pages, he will be able, in a number of cases of obsessions, to attempt *Übersetzung* to *retranslate* [*Rückübersetzung*][T] *them into sexual terms*.

1 [Here we have a first hint at innumerable later discussions by Freud as to the nature of the unconscious. Cf. p. 179 *n.* 4 below.]

2 ['*disloziert*' and '*transponiert*'. The word ordinarily used by Freud to describe this process – '*Verschiebung*', regularly translated 'displacement' – does not appear in this passage, though it occurs later in this paper, p. 56 below, and had been used by Freud as early as in his Preface to his translation of Bernheim's *De la suggestion* (Freud, 1888–89*a*), *RSE*, 1, 83.]

To provide this secondary connection for the liberated affect, any idea can be made use of which is either able, from its nature, to be united with an affect of the *quality* in question, or which has certain relations to the incompatible idea which make it seem as though it could serve as a surrogate for it. Thus, for example, liberated anxiety [*Angst*][T], whose sexual origin must not be remembered by the patient, will seize upon the common primary phobias of mankind about animals, thunderstorms, darkness and so on, or upon things which are unmistakably associated in one way or another with what is sexual – such as micturition, defaecation, or dirtying and contagion generally.

The ego gains much less advantage from choosing *transposition* of affect as a method of defence than from choosing the hysterical *conversion* of psychical excitation into somatic innervation. The affect from which the ego has suffered remains as it was before, unaltered and undiminished, the only difference being that the incompatible idea is kept down and shut out from recollection.[1] The repressed ideas, as in the other case, form the nucleus of a second psychical group, which, I [55] believe, is accessible even without the help of hypnosis. If phobias and obsessions are unaccompanied by the striking symptoms which characterize the formation of an independent psychical group in hysteria, this is doubtless because in their case the whole alteration has remained in the psychical sphere and the relationship between psychical excitation and somatic innervation has undergone no change.

To illustrate what has been said about obsessions, I will give a few examples which are, I imagine, of a typical kind:

(1) A girl suffered from obsessional self-reproaches. If she read something in the papers about coiners, the thought would occur to her that she, too, had made counterfeit money; if a murder had been committed by an unknown person, she would ask herself anxiously whether it was not she who had done the deed. At the same time she was perfectly conscious of the absurdity of these obsessional reproaches. For a time, this sense of guilt gained such an ascendancy over her that her powers of criticism were stifled and she accused herself to her relatives and her doctor of having really committed all these crimes. (This was an example of a psychosis through simple intensification – an '*Überwältigungspsychose*' [a psychosis in which the ego is overwhelmed].[2]) Close questioning then

1 [Freud elaborated this point in his metapsychological paper on 'Repression' (1915*d*), *RSE*, **14**, 137–9.]

2 [Literally 'psychosis of overwhelming'. The 'overwhelming' of the patient's ego in different forms of defence neurosis is discussed at several points by Freud in a paper sent to Fliess on

revealed the source from which her sense of guilt arose. Stimulated by a chance voluptuous sensation, she had allowed herself to be led astray by a woman friend into masturbating, and had practised it for years, fully conscious of her wrongdoing and to the accompaniment of the most violent, but, as usual, ineffective self-reproaches. An excessive indulgence after going to a ball had produced the intensification that led to the
[56] psychosis. After a few months of treatment and the strictest surveillance, the girl recovered.[1]

(2) Another girl suffered from the dread of being overcome by the need to urinate, and of being unable to avoid wetting herself, ever since a need of this kind had in fact once obliged her to leave a concert hall during the performance. By degrees this phobia had made her completely incapable of enjoying herself or of going into society. She only felt well if she knew that there was a WC near at hand which she could reach unobtrusively. There was no question of any organic complaint which might justify this mistrust in her power to control her bladder; when she was at home, in quiet conditions, or at night, the need to urinate did not arise. A detailed examination showed that the need had occurred first in the following circumstances. In the concert hall a gentleman to whom she was not indifferent had taken a seat not far from her. She began to think about him and to imagine herself sitting beside him as his wife. During this erotic reverie she had the bodily sensation which is to be compared with an erection in a man, and which in her case – I do not know if this is always so – ended with a slight need to urinate. She now became greatly frightened by the sexual sensation (to which she was normally accustomed) because she had resolved within herself to combat this particular liking, as well as any other she might feel; and next moment the affect had become transferred on to the accompanying need to urinate and compelled her after an agonizing struggle to leave the hall. In her ordinary life she was so prudish that she had an intense horror of everything to do with sex and could not contemplate the thought of ever marrying. On the other hand, she was so hyperaesthetic sexually that during every erotic reverie, in which she readily indulged, the same voluptuous sensation appeared. The erection was each time accompanied by the need to urinate, though without its making any impression on her until the scene

January 1, 1896 (Freud, 1950*a*, Draft K; *RSE*, **1**, 248 ff.). The actual term '*Überwältigungspsychose*' occurs in a letter a year later, on January 11, 1897 (ibid., Letter 55). An allusion to the overwhelming of the ego can also be found in Freud's contribution to *Studies on Hysteria* (1895*d*), ibid., **2**, 234–5. But the idea recurs in far later writings of Freud's; see, for instance, *The Ego and the Id* (1923*b*), ibid., **19**, 51.]

1 [This case is reported again very briefly in 'Obsessions and Phobias' (1895*c*), below, p. 69.]

in the concert hall. The treatment led to an almost complete control over her phobia.[1]

(3) A young married woman who, in five years of marriage, had had only one child, complained to me of an obsessional impulse [*Zwangsimpuls*] to throw herself out of the window or from the balcony, and also of a fear, which seized her when she saw a sharp knife, of stabbing her child with it. She admitted that marital intercourse seldom occurred, and only subject to precautions against conception, but she did not miss it, she said, as hers was not a sensual nature. At this point I ventured to tell her that at the sight of a man she had erotic ideas and that she had therefore lost confidence in herself and regarded herself as a depraved person, capable of anything. The translation back of the obsessional idea into sexual terms was successful. In tears, she at once confessed the long-concealed poverty of her marriage; and later she told me also of distressing ideas of an unmodified sexual character, such as the often recurring sensation of something forcing itself under her skirt. [57] *Zwang*

I have turned observations of this kind to account in my therapeutic work by leading back the attention of patients with phobias and obsessions to the repressed sexual ideas in spite of all their protestations, and, wherever possible, by stopping up the sources from which those ideas sprang. I cannot, of course, assert that *all* phobias and obsessions arise in the manner I have shown here. In the first place, my experience of them includes only a limited number compared with the frequency of these neuroses; and in the second place, I myself am aware that such 'psychasthenic' symptoms, as Janet terms them, are not all equivalent.[2] There are, for instance, purely hysterical phobias. Nevertheless, I think that it will be possible to show the presence of the mechanism of transposition of affect in the great majority of phobias [58]

1 [This case, too, is mentioned in 'Obsessions and Phobias', below, p. 70. It is also referred to by Freud in a letter to Fliess written on February 7, 1894, very soon after the completion of this paper: 'You are right. The connection between obsessional neurosis and sexuality is not always so obvious. I can assure you it was not so easy to find either in my Case 2 (Need to urinate). If anyone less mono-ideistic than I am had looked for it, he would have overlooked it. Yet in this case, which I have got to know thoroughly in the course of several months' treatment by feeding-up, sexuality dominated positively the whole scene.' (Freud, 1950*a*, Letter 16.) Freud used at this period sometimes to combine the cathartic method with the Weir Mitchell ('feeding-up') treatment. See *Studies on Hysteria* (1895*d*), *RSE*, **2**, 237 f.]

2 The group of typical phobias, of which agoraphobia is a model, cannot be traced back to the psychical mechanism described above; on the contrary, the mechanism of agoraphobia differs from that of obsessions proper, and of the phobias that are reducible to them, in one decisive point. There is no repressed idea from which the anxiety affect might have been separated off. The anxiety of these phobias has another origin. [See the Editors' Appendix to 'Obsessions and Phobias', p. 75 f. below.]

and obsessions, and I would therefore urge that these neuroses, which are found in an isolated state as often as in combination with hysteria or neurasthenia, should not be thrown into a heap along with common neurasthenia, for the basic symptoms of which there is no ground at all to assume a *psychical* mechanism.

III

In both the instances considered so far, defence against the incompatible idea was effected by separating it from its affect; the idea itself remained in consciousness, even though weakened and isolated. There is, however, a much more energetic and successful kind of defence. Here, the ego rejects the incompatible[1] idea together with its affect and behaves as if the idea had never occurred to the ego at all. *But from the moment at which this has been successfully done the subject is in a psychosis, which can only be classified as 'hallucinatory confusion'*. A single example may serve to illustrate this statement:

A girl had given her first impulsive affection to a man, and firmly believed that he returned her love. In fact, she was wrong; the young man had a different motive for visiting the house. Disappointments were not wanting. At first she defended herself against them by effecting a hysterical conversion of the experiences in question and thus preserved her belief that one day he would come and ask her hand. But at the same time she felt unhappy and ill, because the conversion was incomplete and because she was continually being met with fresh painful impressions. Finally, in a state of great tension, she awaited his arrival on a particular day, the day of a family celebration. But the day wore on and he did not appear. When all the trains by which he could arrive had come and gone, she passed into a state of hallucinatory confusion: he had arrived, she
[59] heard his voice in the garden, she hurried down in her nightdress to receive him. From that time on she lived for two months in a happy dream, whose content was that he was there, always at her side, and that everything was as it had been before (before the time of the disappointments which she had so laboriously fended off [*abgewehrten*]). Her hysteria and her depression of spirits were overcome. During her illness she was silent about the whole latter period of doubt and suffering; she was happy so long as she was left undisturbed, and she broke out in fury only when some rule of conduct insisted on by those around her hindered her in something which seemed to her to follow quite logically

1 ['Intolerable' in all the German editions, but see footnote 4, p. 48 above.]

from her blissful dream. This psychosis, which had been unintelligible at the time, was explained ten years later with the help of a hypnotic analysis [cf. p. 44 *n.* 2 above].

The fact to which I now wish to call attention is that the content of a hallucinatory psychosis of this sort *consists precisely in the accentuation of the idea* which was threatened by the precipitating cause of the onset of the illness. One is therefore justified in saying that the ego has fended off the incompatible[1] idea through a flight into psychosis.[2] The process by which this has been achieved once more eludes the subject's self-perception, as it eludes psychologico-clinical analysis. It must be regarded as the expression of a pathological disposition of a fairly high degree and it may be described more or less as follows. The ego breaks away from the incompatible[3] idea; but the latter is inseparably connected with a piece of reality, so that, insofar as the ego achieves this result, it, too, has detached itself wholly or in part from reality.[4] In my opinion this latter event is the condition under which the subject's ideas receive the vividness of hallucinations; and thus when the defence has been [60] successfully carried out he finds himself in a state of hallucinatory confusion.

I have only very few analyses of psychoses of this sort at my disposal. But I think we have to do here with a type of psychical illness which is very frequently employed. For no insane asylum is without what must be regarded as analogous examples – the mother who has fallen ill from the loss of her baby, and now rocks a piece of wood unceasingly in her arms, or the jilted bride who, arrayed in her wedding dress, has for years been waiting for her bridegroom.

It is perhaps not superfluous to point out that the three methods of defence here described, and, along with them, the three forms of illness to which those methods lead, may be combined in the same person. The simultaneous appearance of phobias and hysterical symptoms which is so often observed in practice is one of the factors which render it difficult to separate hysteria clearly from other neuroses and which

1 ['Intolerable' in all the German editions, but see footnote 4, p. 48 above.]

2 [This notion, in the more generalized form of a 'flight into illness', became widely used and accepted. See Freud's *Autobiographical Study* (1925*d*), *RSE*, **20**, 47, and p. 42 *n.* 2 above.]

3 ['Intolerable' in all the German editions except the original publication, which reads 'incompatible'. See footnote 4, p. 48 above.]

4 [Freud was here touching on a problem that was to occupy him much towards the end of his life. See, for instance, 'Neurosis and Psychosis' (1924*b*), 'The Loss of Reality in Neurosis and Psychosis' (1924*e*), 'Fetishism' (1927*e*) and the posthumous fragment 'Splitting of the Ego in the Process of Defence' (1940*e* [1938]).]

make it necessary to set up the category of 'mixed neuroses'. It is true that hallucinatory confusion is not often compatible with a persistence of hysteria, nor, as a rule, of obsessions. On the other hand, it is not rare for a psychosis of defence episodically to break through the course of a hysterical or mixed neurosis.

I should like, finally, to dwell for a moment on the working hypothesis which I have made use of in this exposition of the neuroses of defence. I refer to the concept that in mental functions something is to be distinguished – a quota of affect or sum of excitation – which possesses all the characteristics of a quantity (though we have no means of measuring it), which is capable of increase, diminution, displacement [*Verschiebung*][T] and discharge, and which is spread over the memory traces of ideas somewhat as an electric charge is spread over the surface of a body.[1]

This hypothesis, which, incidentally, already underlies our theory of
[61] 'abreaction' in our 'Preliminary Communication' (1893*a*), can be applied in the same sense as physicists apply the hypothesis of a flow of electric fluid. It is provisionally justified by its utility in coordinating and explaining a great variety of psychical states.

Vienna, end of January, 1894

1 [Some comments on this paragraph can be found in the Appendix which follows this paper.]

APPENDIX

THE EMERGENCE OF FREUD'S FUNDAMENTAL HYPOTHESES

With this first paper on the neuropsychoses of defence Freud gave public expression, [62]
if not directly, at least by implication, to many of the most fundamental of the theoretical notions on which all his later work rested. It may be recalled that the paper was written in January, 1894 – a year after the publication of the 'Preliminary Communication' and a year before the completion of the main portion of the *Studies on Hysteria*, and of Breuer's theoretical contribution to that volume. At the time of writing this paper, therefore, Freud was deeply involved in his first series of psychological investigations. From these a number of clinical inferences were beginning to emerge, and behind them some more general hypotheses which would lend coherence to the clinical findings. But it was not for another six months after the publication of *Studies on Hysteria* – in the autumn of 1895 – that Freud made a first attempt at a systematic exposition of his theoretical views; and that attempt (the 'Project for a Scientific Psychology') was left uncompleted and unpublished by its author. It first saw the light of day in 1950, more than half a century later. In the meantime the curious student of Freud's theoretical views had to pick up what he could from the discontinuous and sometimes obscure accounts given by Freud at various later points in his career. Moreover, his one extended discussion of his theories in later years – the metapsychological papers of 1915 – have survived only in a truncated form: four of the twelve papers having completely disappeared.[1]

In his 'History of the Psychoanalytic Movement' (1914*d*) Freud declared that 'the theory of repression', or defence, to give it its alternative name, 'is the cornerstone on which the whole structure of psychoanalysis rests' (*RSE*, **14**, 13). The term 'defence' ('*Abwehr*') actually occurs for the first time in the present paper (p. 45 [63]
above), and it is here that the theory receives its earliest effective consideration, though a bare sentence or two had been devoted to it in the 'Preliminary Communication' (*RSE*, **2**, 9) and in the 'Lecture' (p. 36 above).[2]

This clinical hypothesis of defence, however, was itself necessarily based on more general assumptions, one of which is specified in the penultimate paragraph of this paper (p. 56 above). This assumption may conveniently be named (though the name derives from a somewhat later date) the theory of 'cathexis' ('*Besetzung*').[3] There is

1 See *RSE*, **14**, 93–5.

2 A still earlier hint at the theory may be traced in Section (5) of an unpublished draft of the 'Preliminary Communication' dated 'End of November, 1892' (Breuer & Freud, 1940*d*).

3 Freud's first use of the term in this sense seems to have been in the *Studies on Hysteria* (1895*d*), *RSE*, **2**, 79 and 135, which was published about a year later than the present paper. The German word is one in ordinary use, and, among many other senses, might have some such meaning as 'occupation' or 'filling'. Freud, who disliked unnecessary technical terms, was unhappy when, in

perhaps no other passage in Freud's published writings in which he so explicitly recognizes the necessity for this most fundamental of all his hypotheses: 'that in mental functions something is to be distinguished – a quota of affect or sum of excitation – which possesses all the characteristics of a quantity . . ., which is capable of increase, diminution, displacement and discharge. . . .' The notion of a 'displaceable quantity' had, of course, been implicit in all his earlier theoretical discussions. As he himself points out in this same passage, it underlay the theory of abreaction; it was the necessary basis of the principle of constancy (which will be discussed in a moment); it was implied whenever Freud made use of such phrases as 'the sum of excitation . . . with which it is loaded' (p. 46 above), 'provided with a quota of affect' (1893*c*), 'supplied with energy' (1895*b*) – predecessors of what was soon to become the standard term 'cathected'. Already, in his Preface to his first translation of Bernheim (1888–89*a*), he had spoken of 'displacements of excitability in the nervous system'.

[64] This last example, however, reminds us of the presence of a further complication. Rather more than eighteen months after writing the present paper Freud sent to Fliess the remarkable fragment known as the 'Project', which has already been mentioned above. Here for the first and last time we find the hypothesis of cathexis fully discussed. But this full discussion brings clearly to light something that is only too easily forgotten. Throughout this period Freud appears to have regarded these cathectic processes as *material* events. In his 'Project' two basic assumptions were laid down. The first was the validity of the recent histological discovery that the nervous system consisted of networks of neurons; the second was the idea that excitation of the neurons was to be regarded as '*Q*, subject to the general laws of motion'. By combining these two assumptions 'we arrive at the idea of a *cathected* neuron filled with a certain *Qη* while at other times it may be empty' ('Project', Part I, Section 2; *RSE*, **1**, 322). But though cathexis was thus defined primarily as a neurological event, the situation was not quite so simple. Till very recently Freud's interest had been centred on neuroscience, and now that his thoughts were being more and more diverted to psychology his first endeavour was naturally to reconcile his two interests. He believed it should be possible to state the facts of psychology in neurological terms, and his efforts to do so culminated precisely in the 'Project'. The attempt failed; the 'Project' was abandoned; and in the years that followed little more was heard of a neurological explanation of psychological events except (as we shall see below, p. 96 f.) in connection with the problem of the 'actual neuroses'. Nevertheless, this repulse did not involve any wholesale revolution. The fact was, no doubt, that the formulations and hypotheses which Freud put forward in neurological terms had actually been constructed with more than half an eye to psychological events; and when the time came for dropping the neuroscience it turned out that the greater part of the theoretical material could be understood as applying, and indeed applying more cogently, to the mental phenomena directly. Thenceforward for Freud 'psychology' rested upon the *functional* organization of the nervous system, regardless of its specific physiology and anatomical construction.

1922, James Strachey, the Editor of the *SE*, in the supposed interests of clarity, introduced the invented word 'cathexis' (from the Greek *κατέχειν*, catechein, to occupy) as a translation. He may perhaps have become reconciled to it in the end, since it is to be found in his original manuscript of his *Encyclopaedia Britannica* article (1926*f*), *RSE*, **20**, 249. See ibid., **24**, 59–61, for a full discussion of the translation of this term.

These considerations apply to the concept of 'cathexis', which possessed an entirely non-physical meaning in all Freud's later writings, including the theoretical seventh chapter of *The Interpretation of Dreams* (1900*a*).[1] They apply also to the further [65] hypothesis, which makes use of the concept of cathexis, and which was later known as the 'principle of constancy'. This too began as an apparently physiological hypothesis. It is stated in the 'Project' (Part I, Section 1) as 'the principle of neuronal inertia: that neurons tend to divest themselves of *Q*'. It was stated twenty-five years later in psychological terms in *Beyond the Pleasure Principle* (1920*g*) as follows: 'The mental apparatus endeavours to keep the quantity of excitation present in it as low as possible or at least to keep it constant.' (*RSE*, **18**, 8–9.) This principle is not stated explicitly in the present paper, though it is implied at several points. It had already been mentioned in the lecture on the 'Preliminary Communication' (1893*h*, p. 35 above), though not in the 'Preliminary Communication' itself, and in the French paper on hysterical paralyses (1893*c*). It was also very clearly stated in a posthumously published draft of the 'Preliminary Communication' (1940*d*), dated 'End of November, 1892', and was referred to, earlier still, in a letter from Freud to Breuer dated June 29, 1892 (1941*a*), as well as, by implication, in one of Freud's footnotes to his translation of a volume of Charcot's *Leçons du mardi* (Freud, 1892–94*a*), *RSE*, **1**, 165 f. In later years the principle was repeatedly discussed: for instance, by Breuer in his theoretical contribution to *Studies on Hysteria* (1895*d*), ibid., **2**, 175–6, and by Freud in 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 104–6, and in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 8 ff., 25 ff. and 53 ff., where he first gave it the new name of 'Nirvana principle'.

The pleasure principle, no less fundamental in Freud's psychological armoury than the constancy principle, is equally present, though once more only by implica- [66] tion, in this paper. To begin with he regarded the two principles as intimately connected and perhaps identical. In the 'Project' (Part I, Section 8) he wrote: 'Since we have certain knowledge of a trend in psychical life towards *avoiding unpleasure*, we are tempted to identify that trend with the primary trend towards inertia. In that case *unpleasure* would have to be regarded as coinciding with a raising of the level of *Qη* . . . *Pleasure* would be the sensation of discharge.' (Ibid., **1**, 336.) It was not until very much later, in 'The Economic Problem of Masochism' (1924*c*), that Freud demonstrated the necessity for distinguishing between the two principles, ibid., **19**, 151–3. The course of his changing views on this question is followed in detail in an Editors' footnote to the metapsychological paper on 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 106–7 *n*.[2]

1 It must be remarked that, though the theory of cathexis as a displaceable quantity was already explicit at the time of the present paper, further vitally important elaborations of the theory were still to be made: in particular the notion that cathectic energy occurs in two forms, bound and free. This additional hypothesis, with its corollary of the distinction between the primary and secondary mental processes, possibly adumbrated by Breuer in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 173 *n*., was included by Freud in his 'Project', but was first fully and publicly announced in Chapter VII of *The Interpretation of Dreams* (1900*a*). Nevertheless, although the technical term 'free energy' ultimately derives from Helmholtz (see ibid., **1**, 417; **2**, 173), it is perhaps not without significance that Freud writes on p. 48 f. above that affect that has 'become free' of a repressed idea attaches itself to other ideas.

2 Freud's first long discussion of the pleasure principle occurs under the name of the 'unpleasure principle' in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 537 ff.; he took the hypothesis up again (this time under its now familiar name) in his paper on the two principles of mental functioning (1911*b*), where he showed how the pleasure principle becomes modified into the reality principle, ibid., **12**, 216.

The further question may be asked of how far these fundamental hypotheses were peculiar to Freud and how far they were derived from other influences. Many possible sources have been suggested – Helmholtz, Herbart, Fechner, Meynert, among others. This, however, is not the place for entering into such a wide-ranging question. It is enough to say that it has been exhaustively examined by Ernest Jones in the first volume of his Freud biography (1953, 405–15).

A few words may be directed to a point that arises particularly out of the penultimate paragraph of this paper – the apparent equating there of the terms 'quota of affect (*Affektbetrag*)' and 'sum of excitation (*Erregungssumme*)'. Is Freud using the words as synonyms? The account that Freud gives of affects in Lecture XXV of his *Introductory Lectures* (1916–17*a*) and his use of the word in Section III of his paper on 'The Unconscious' (1915*e*), as well as numerous other passages, show that as a rule he meant by 'affect' much the same as what we mean by 'feeling' or 'emotion'. 'Excitation', on the other hand, is one of several terms that he seems to use to describe the
[67] unknown energy of 'cathexis'. In the 'Project', as we have seen, he simply calls this 'quantity'. Elsewhere he uses such terms as 'psychical intensity'[1] or 'drive energy'. 'Sum of excitation' itself goes back to his mention of the principle of constancy in his letter to Breuer of June, 1892. Thus the two terms would appear *not* to be synonyms. This view is confirmed by a passage in Breuer's theoretical chapter of *Studies on Hysteria* in which he gives reasons for supposing that affects 'go along with an increase of excitation', implying that they are two different things (*RSE*, **2**, 179–81). All this would seem quite straightforward if it were not for a passage in the metapsychological paper on 'Repression' (1915*d*), ibid., **14**, 135 ff. This is the passage in which Freud shows that the 'psychical representative' of a drive consists of two elements which have quite different vicissitudes under repression. One of these elements is the idea or group of ideas cathected, the other is the drive energy cathecting it. 'For this other element of the psychical representative the term *quota of affect* has been generally adopted.'[2] A few sentences later, and at several other points, he refers to this element as 'the quantitative factor', but then, a little later still, he once more speaks of it as the 'quota of affect'. At first sight it looks as though Freud was here treating affect and psychical energy as synonymous notions. But this cannot, after all, be the case, since in the very same passage he mentions as a possible drive vicissitude 'the *transformation* into *affects* . . . of the psychical energies of drives' (ibid., **14**, 135).

The explanation of the apparent ambiguity seems to lie in Freud's underlying view of the nature of affects. This is perhaps most clearly stated in the third section of the paper on 'The Unconscious' (1915*e*), ibid., **14**, 158, where Freud declares that affects 'correspond to processes of discharge, the final manifestations of which are perceived as sensations'. Similarly in Lecture XXV of the *Introductory Lectures* (1916–17*a*) he enquires what an affect is 'in the dynamic sense' and goes on: 'An affect
[68] includes in the first place particular motor innervations or discharges and secondly certain feelings; the latter are of two kinds – perceptions of the motor actions that have occurred and the direct feelings of pleasure and unpleasure which, as we say,

1 See for instance pp. 115 and 300 below.

2 In a much later passage, in his paper on 'Fetishism' (1927*e*), which refers back to this discussion in 'Repression', he writes once again of the differentiation 'between the vicissitude of the *idea* as distinct from that of the *affect*' (*RSE*, **21**, 138).

give the affect its keynote.' (*RSE*, **16**, 349.) And, lastly, in the paper on 'Repression' from which we started, he writes that the quota of affect 'corresponds to the drive insofar as the latter . . . finds expression, proportionate to its quantity, in processes which are sensed as affects' (ibid., **14**, 135).

Thus it is probably correct to suppose that Freud was regarding the 'quota of affect' as *a particular manifestation* of the 'sum of excitation', namely the portion of it that is *discharged* in consciousness. It is no doubt true that affect was what was usually involved in the cases of hysteria and obsessional neurosis with which Freud was chiefly concerned in the early days. For that reason he tended at that time to describe the 'displaceable quantity' as a quota of affect rather than in more general terms as an excitation; and this habit would seem to have persisted even in the metapsychological papers where a more precise differentiation might have contributed to the clarity of his argument. We must remember that, for Freud, affect was always a *conscious* state. Perhaps this whole matter would have been clearer if the metapsychological paper on consciousness had survived.

OBSESSIONS AND PHOBIAS

Their Psychical Mechanism and their Aetiology

(1895 [1894])

EDITORS' NOTE

OBSESSIONS ET PHOBIES
Leur Mécanisme Psychique et leur Étiologie

ENGLISH TRANSLATIONS

'Obsessions and Phobias'
1924 *CP*, **1**, 128–37. (Tr. M. Meyer.)
1962 *SE*, **3**, 74–84. (Tr. J. Strachey; considerably revised version of the 1924 translation.)

Included (No. XXX) in Freud's own collection of abstracts of his early works (1897*b*). The original is in French. The present translation is a revised and corrected reprint of the *SE* version. A German translation, by A. Schiff, under the title 'Zwangsvorstellungen und Phobien', was published in the *Wien. klin. Rundsch.*, **9** (17), 262–3, and (18), 276–8, on April 28, and May 5, 1895.

Though this paper was published a fortnight later than the first paper on anxiety neurosis (1895*b*), it was written earlier; for there is a reference here (p. 73 below) to the one on anxiety neurosis as something that Freud hopes to write in the future, and in that paper there is a reference back to this one (p. 87 *n.* 2).

The earlier part of this paper is little more than a repetition of Section II of the first paper on 'The Neuropsychoses of Defence' (1894*a*), dealing with obsessions. The later part, concerned with phobias, is discussed in the Editors' Appendix below (pp. 75–6). Freud gave a lecture on these subjects under the title 'Mechanismus der Zwangsvorstellungen und Phobien' to the Vienna Verein für Psychiatrie und Neurologie on January 15, 1895, and his own abstract of it was printed later in the year in *Wien. klin. Wschr.*, **8** (27), 496. A translation of this abstract is included on p. 248 below.

[72] The present paper is one of three papers which Freud wrote in French at about this period; the first (1893*c*), dealing with the distinction between organic and hysterical paralyses, can be found in the first volume of the *Revised Standard Edition*, and the remaining one below, on p. 153 ff. In one or two cases the French terms selected by Freud himself as renderings of the German ones are of interest to the English translator. Thus he almost always translates '*Zwangsvorstellung*' by the French '*obsession*'. This ought to set at rest any uneasy feeling that the proper English version should be 'compulsive idea'[1] or something of the sort.[t] Actually there seems to have been no German equivalent to the French and English word until Krafft-Ebing introduced '*Zwangsvorstellung*' in 1867 (cf. Löwenfeld, 1904, 8). The English 'obsession', in the sense of a fixed idea, goes back at least to the seventeenth century. Similarly Freud translates '*Zwangsneurose*' by the French '*névrose d'obsessions*'. The German '*Angstneurose*' he renders '*névrose d'angoisse*'; in one place at least, however (on p. 68), he renders '*Angst*' by '*anxiété*', a French word with much the same connotation as the English 'anxiety'. (See p. 104 below.)[2] Another word which Freud uses very frequently indeed in his writings at this period is '*unverträglich*' as applied to the ideas repressed in hysteria or got rid of in other ways in obsessional neurosis. There has been a good deal of unwillingness to accept this word as meaning 'incompatible'. There is another German word with only a single letter fewer, '*unerträglich*', which means 'intolerable'. This latter word appears a few times, probably as a misprint, in the German editions (cf. p. 48 *n.* 4 above), and 'intolerable' was adopted as the uniform translation in the greater part of the first volume of the *Collected Papers* of 1924. Doubts about the sense intended by Freud seem to be settled by the French equivalent which he has chosen – '*inconciliable*'.

It may be added that in Volume I of the *Gesammelte Werke* (published in 1952), at the beginning of the first of these French papers (which is the one included in Volume 1 of the *RSE*) the following footnote appears: 'In the three articles in French, the original text has been revised and corrected as regards misprints and errors in French, though strict respect has been paid to the meaning.' The majority of the changes thus
[73] made are purely verbal and have consequently not affected the English translation. In some cases, however, in this paper and in the one below (p. 153 ff.), the changes may perhaps be thought to have gone further, though in two of these (pp. 155 and 162) the 1952 version actually goes back to the one found in the original periodical publication. In reaching a decision in the doubtful cases it has to be borne in mind that Freud himself most probably read through both the 1906 *and* the 1925 reprints, since he added new footnotes to the latter (cf. p. 5 *n.* 2 above). The 1906 versions are the ones we have usually adopted in the text. In every instance the alternative is given in a footnote.[3]

1 The sense may, of course, sometimes call for the term to be translated 'obsessional idea', and sometimes require the special introduction of the notion of compulsion. Cf., however, p. 129 *n.* 3 below. See *RSE*, **24**, 98–9 for a full discussion.

2 Also see ibid., **24**, 56–7 for a full discussion of the translation of '*Angst*'.

3 As a further point of interest to the translator, it may be remarked that throughout this paper Freud uses the French '*état émotif*' as a rendering of the German '*Affekt*'. Compare the last paragraph on p. 68 below with the last paragraph on p. 48 f. above. See also his own abstract of the French paper, p. 248 below.

OBSESSIONS AND PHOBIAS

Their Psychical Mechanism and their Aetiology

I shall begin by challenging two assertions which are often found repeated in regard to the syndromes 'obsessions'[1] and 'phobias'. It must be said, first, that they cannot be included under neurasthenia proper, since the patients afflicted with these symptoms are no more often neurasthenics than not; and secondly, that we are not justified in regarding them as the effect of mental degeneracy, because they are found in persons no more degenerate than the majority of neurotics in general, because they sometimes improve, and sometimes, indeed, we even succeed in curing them.[2] [74]

Obsessions and phobias are separate neuroses, with a special mechanism and aetiology which I have succeeded in demonstrating in a certain number of cases, and which, I hope, will prove similar in a good number of fresh cases.

As regards classification of the subject, I propose in the first place to exclude a group of intense obsessions which are nothing but memories, unaltered images of important events. As an example, I may cite Pascal's obsession: he always thought he saw an abyss on his left side 'after he had nearly been thrown into the Seine in his coach'.[3] Such obsessions and phobias, which might be called *traumatic*, are allied to the symptoms of hysteria.

Apart from this group we must distinguish: (*a*) true obsessions; (*b*) phobias. The essential difference between them is the following:

Two constituents are found in every obsession: (1) an idea [*idée*][T] that forces itself upon the patient; (2) an associated emotional state [*état émotif*]. Now in the group of phobias this emotional state is always one of 'anxiety', while in true obsessions other emotional states, such as *Vorstellung*

1 [See Editors' Note, p. 66 above.]

2 I am very glad to find that the authors of the most recent work on this subject express opinions very similar to mine. Cf. Gélineau (1894) and Hack Tuke (1894).

3 [See footnote 4, p. 129 below.]

[75] doubt, remorse or anger, may occur just as well as anxiety.[1] I will first attempt to explain the really remarkable psychological mechanism of true obsessions, a mechanism quite different from that of the phobias.

I

In many true obsessions it is quite plain that the emotional state is the principal thing, since that state persists unchanged while the idea associated with it varies. The girl in Case 1 quoted below, for example, felt remorse in some degree for all sorts of reasons – for having stolen, for having ill-treated her sisters, for having made counterfeit money, etc. People who doubt have many doubts at the same time or in succession. It is the emotional state which remains constant in them; the idea changes.

Fixierung In other cases the idea, too, seems fixated [*fixée*][T], as in Case 4, of the girl who pursued the servants in the house with an incomprehensible hatred, though constantly changing the individual object.

Now a careful psychological analysis [*analyse psychologique*][2] of these cases shows that *the emotional state, as such, is always justified.* The girl in Case 1, who suffered from remorse, had good reasons for it; the women in Case 3 who doubted their powers of resistance to temptation knew very well why. The girl in Case 4, who detested servants, had good reasons for complaining, etc. Only, and it is in these two characteristics that the pathological mark lies, (1) *the emotional state persists indefinitely*, and (2) the associated idea is *no longer the appropriate original one, related to the aetiology of the obsession, but is one which replaces it, a substitute for it.*

The proof of this is the fact that we can always find in the previous history of the patient, *at the beginning of the obsession*, the original idea that has been replaced. The replaced ideas all have common attributes; they correspond to really distressing experiences in the subject's sexual life which he is striving to forget. He succeeds merely in replacing the incompatible [*inconciliable*][3] idea by another ill-adapted for being associated with the emotional state, which for its part remains unchanged. It is this *mésalliance*[4] between the emotional state and the associated idea that accounts for the absurdity so characteristic of obsessions.

1 [The first 'anxiety' in this sentence stands for '*angoisse*' in the original, and the second for '*anxiété*'.]

2 [Cf. p. 44 *n.* 2 above.]

3 [See Editors' Note, p. 66 above.]

4 [Elsewhere Freud uses the term 'false connection'. Cf. above, p. 49.]

I will now bring forward my observations and conclude with an attempt at a theoretical explanation. [76]

CASE 1.[1] A girl reproached herself for things which she knew were absurd: for having stolen, for having made counterfeit money, for being involved in a conspiracy, etc., according to what she happened to have been reading during the day.

Reinstatement of the replaced idea: She reproached herself with the masturbation she had been practising in secret without being able to renounce it. She was cured by careful surveillance which prevented her from masturbating.[2]

CASE 2. A young man, a medical student, suffered from an analogous obsession. He reproached himself for all sorts of immoral acts: for having killed his cousin, for having violated his sister, for having set fire to a house, etc. He got to the point of having to turn round in the street to see whether he had not killed the last passer-by.

Reinstatement: He had been much affected by reading in a quasi-medical book that masturbation, to which he was addicted, destroyed one's morale.

CASE 3. Several women complained of an obsessional impulse to throw themselves out of the window, to stab their children with knives, scissors, etc.

Reinstatement: Obsessions based on typical temptations. These were women who, not being at all satisfied in marriage, had to struggle against the desires and voluptuous ideas that constantly troubled them at the sight of other men.

CASE 4. A girl who was perfectly sane and very intelligent displayed an uncontrollable hatred against the servants in the house. It had been started in connection with an impertinent servant, and had been transferred [*transmise*] from servant to servant, to an extent that made housekeeping impossible. The feeling was a mixture of hate and disgust. She gave as a reason for it that the coarseness of these girls spoilt her idea of love.

Reinstatement: This girl had been an involuntary witness to a love scene in which her mother had taken part. She had hidden her face, had stopped up her ears, and had done her utmost to forget it, as it disgusted her and would have made it impossible for her to remain with her mother, [77]

1 ['*Obs. I.*' in the French original. Not all of the 'cases' reported below concern individual patients.]

2 [Freud had reported this case at greater length in his first paper on 'The Neuropsychoses of Defence' (1894*a*), pp. 51–2 above.]

whom she loved tenderly. She succeeded in her efforts; but her anger at her idea of love having been defiled persisted within her, and this emotional state soon linked itself to the idea of a person who could take her mother's place.

CASE 5. A girl had become almost completely isolated on account of an obsessional fear of incontinence of urine. She could no longer leave her room or receive visitors without having urinated a number of times. When she was at home or entirely alone the fear did not trouble her.

Reinstatement: It was an obsession based on temptation or mistrust. She did not mistrust her bladder, but her resistance to erotic impulses. The origin of the obsession shows this clearly. Once, at the theatre, on seeing a man who attracted her, she had felt an erotic desire, accompanied (as spontaneous pollutions in women always are) by a desire to urinate. She was obliged to leave the theatre, and from that moment on she was prey to the fear of having the same sensation, but the desire to urinate had replaced the erotic one. She was completely cured.[1]

Although the cases I have enumerated show varying degrees of complexity, they have this in common: the original (incompatible) idea has been replaced by another idea, the substituted idea. In the cases which I now append, the original idea has been replaced, but not by another idea; it has been replaced by acts or impulses which originally served as measures of *relief* or as *protective* procedures, and are now grotesquely associated with an emotional state which does not fit them, but which has persisted unchanged, and which has remained as justifiable as it was at its origin.

CASE 6. *Obsessional arithmomania.* A woman found herself obliged to count the boards in the floor, the steps in the staircase, etc. – acts which she performed in a ridiculous state of anxiety [*d'angoisse*].

Reinstatement: She had begun the counting in order to distract her mind from obsessional ideas [*ideés obsedantes*][2] (of temptation). She had
[78] succeeded in doing so, but the impulse to count had replaced the original obsession.

CASE 7. *Obsessional brooding and speculating* (*Grübelsucht*)[3]. A woman suffered from attacks of this obsession which ceased only when

1 [This case, too, was reported in the earlier paper (p. 52 f. above), but in somewhat different terms and with less certainty about the physiology of female sexual arousal.]

2 [Cf. Editors' Note, p. 66 above.]

3 [German in the French original.]

she was ill, and then gave place to hypochondriacal fears. The theme of her worry was always a part or function of her body; for example, respiration: 'Why must I breathe? Suppose I didn't want to breathe?' etc.

Reinstatement: At the very beginning she had suffered from the fear of becoming insane, a hypochondriacal phobia common enough among women who are not satisfied by their husbands, as she was not. *To assure herself that she was not going mad*, that she was still in possession of her mental faculties, she had begun to ask herself questions and concern herself with serious problems. This calmed her at first, but with time the habit of speculation replaced the phobia. For more than fifteen years, periods of fear (pathophobia) and of obsessive speculating had alternated in her.

CASE 8. *Folie du doute*. Several cases showed the typical symptoms of this obsession but were explained very simply. These persons had suffered or were still suffering from various obsessions, and the knowledge that the obsessions had disturbed all their acts and had frequently interrupted their train of thought provoked a legitimate doubt about the reliability of their memory. The confidence of each one of us is shaken, and we all of us have to re-read a letter or repeat a calculation if our attention has been distracted several times during the performance of the act. Doubt is a quite logical result when obsessions are present.

CASE 9. *Folie du doute*. (*Hesitation*.) The girl in Case 4 had become extremely slow in the performance of all her everyday actions, particularly in her toilet. She took hours to tie her shoelaces or to clean her fingernails. By way of explanation she said she could not make her toilet while the obsessional ideas were occupying her, nor immediately afterwards. As a result, she had become accustomed to wait a definite length of time after each return of the obsessional idea.

CASE 10. *Folie du doute*. (*Fear of scraps of paper*.) A young woman had suffered from scruples after having written a letter; at the same time she collected all the pieces of paper she saw. She explained this by confessing to a love which she had formerly refused to admit. As a result of constantly repeating her lover's name, she was seized with a fear that the name might have slipped off the end of her pen, that she might have written it upon some scrap of paper in a pensive moment.[1] [79]

1 Cf. the German popular song:

Auf jedes weisse Blatt Papier möcht' ich es schreiben:
Dein ist mein Herz und soll es ewig, ewig bleiben.
[On each blank piece of paper I will write it plain:
My heart is thine and ever ever shall remain.

The German couplet, with a slight variation, occurs in 'Ungeduld', one of the poems in Wilhelm Müller's cycle *Die schöne Müllerin*, set to music by Schubert.]

CASE 11. *Mysophobia*. [*Fear of dirt*.] A woman kept washing her hands constantly and touched door handles only with her elbow.

Reinstatement: It was the case of Lady Macbeth. The washing was symbolic, designed to replace by physical purity the moral purity which she regretted having lost. She tormented herself with remorse for conjugal infidelity, the memory of which she had resolved to banish from her mind.[1] In addition, she used to wash her genitals.

As regards the theory of this process of substitution, I will content myself with answering three questions that arise here.

(1) How can the substitution come about?

It seems to be the expression of a special inherited mental disposition. At any rate, 'similar heredity'[2] is often enough found in obsessional cases, as in hysteria. Thus the patient in Case 2 told me that his father had suffered from similar symptoms. He once introduced me to a first cousin who had obsessions and a *tic convulsif*, and to his sister's daughter, aged eleven, who already gave evidence of obsessions (probably of remorse).

(2) What is the motive for the substitution?

Abwehr I think it may be regarded as an act of defence [*défense*]^{T} (*Abwehr*)[3] of *Ich* the ego [*moi*]^{T} against the incompatible idea. Among my patients there [80] are some who remember a deliberate effort to banish the distressing idea or recollection from the field of consciousness. (See Cases 3, 4, 11.) In other cases the expulsion of the incompatible idea is brought about in an unconscious manner which has left no trace in the patient's memory.

(3) Why does the emotional state that is associated with the obsessional idea persist indefinitely instead of vanishing like other states of our ego?

This question may be answered by reference to the theory of the genesis of hysterical symptoms developed by Breuer and myself.[4] Here I will only remark that, by the very fact of the substitution, the disappearance of the emotional state is rendered impossible.

1 [This point, including the reference to Lady Macbeth, was mentioned afterwards by Breuer in his contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 219 *n*. 1.]

2 [See the discussion of this below, on pp. 154–5.]

3 [German in the French original.]

4 'On the Psychical Mechanism of Hysterical Phenomena' (1893*a*) [the 'Preliminary Communication' to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 3].

II

In addition to these two groups of true obsessions there is the class of 'phobias', which must now be considered. I have already mentioned the great difference between obsessions and phobias: that in the latter the emotion is always one of anxiety, fear [*l'anxieté, la peur*][T]. I might add that obsessions are varied and more specialized, phobias are more monotonous and typical. But this distinction is not of capital importance.

Among the phobias, also, two groups may be differentiated, according to the nature of the object feared: (1) common phobias, an exaggerated fear of things that everyone detests or fears to some extent: such as night, solitude, death, illnesses, dangers in general, snakes, etc.; (2) contingent phobias, the fear of special conditions that inspire no fear in the normal man; for example, agoraphobia and the other phobias of locomotion. It is interesting to note that these phobias have not the obsessive [*obsédantes*] feature that characterizes true obsessions and the common phobias. The emotional state appears in their instance only under special conditions which the patient carefully avoids.

The mechanism of phobias is entirely different from that of obsessions. Substitution is no longer the predominant feature in the former; psychological analysis reveals no incompatible, replaced idea in them. Nothing is ever found but *the emotional state of anxiety* which, by a kind [81]
of selective process, brings up all the ideas adapted to become the subject of a phobia. In the case of agoraphobia, etc., we often find *the recollection of an anxiety attack*; and what the patient actually fears is the occurrence of such an attack under the special conditions in which he believes he cannot escape it.

The anxiety belonging to this emotional state, which underlies all phobias, is not derived from any memory; we may well wonder what the source of this powerful condition of the nervous system can be.

I hope to be able to demonstrate, on another occasion, that there is reason to distinguish a special neurosis, the 'anxiety neurosis',[1] of which the chief symptom is this emotional state. I shall then enumerate its various symptoms and insist on the necessity for differentiating this neurosis from neurasthenia, with which it is now confused. *Phobias*, then, *are a part of the anxiety neurosis*, and are almost always accompanied by other symptoms of the same group.

1 [The first paper on anxiety neurosis (1895*b*) had in fact been published a fortnight before the present one. See below, p. 79.]

The anxiety neurosis, too, *has a sexual origin* as far as I can see, but it does not attach itself to ideas taken from sexual life; properly speaking, it has no psychical mechanism. Its specific cause is the accumulation of sexual tension, produced by abstinence or by unconsummated[1] sexual excitation (using the term as a general formula for the effects of *coitus reservatus*,[2] of relative impotence in the husband, of excitation without satisfaction in engaged couples, of enforced abstinence, etc.).

It is under such conditions, extremely frequent in modern society, especially among women, that anxiety neurosis (of which phobias are a psychical manifestation) develops.

[82] In conclusion I may point out that combinations of a phobia and an obsession proper may coexist, and that indeed this is a very frequent occurrence. We may find that a phobia had developed at the beginning of the disease as a symptom of anxiety neurosis. The idea which constitutes the phobia and which is associated with the state of fear may be replaced by another idea or rather by the *protective procedure* that seemed to relieve the fear. Case 7[3] (obsessive speculating) presents a neat example of this group: *a phobia along with a true substitutive obsession*.

1 [The French word in the original is '*fruste*'. This word means 'worn', 'rubbed', as applied especially to coins, and is often used by Freud in the phrase '*forme fruste*' (e.g. in the Charcot obituary, 1893*f*; see above, p. 12). It is here evidently confused with the quite different French word '*frustrée*', meaning 'frustrated'. This too is often used by Freud in a German form '*frustrane*' (e.g. in the first paper on anxiety neurosis, p. 91 below).]

2 ['*Réservé*' in all the earlier French editions. In 1952 only, this is changed to '*interrompu*'. Cf. Editors' Note above, p. 66.]

3 [In all the French editions this is wrongly given as '6'.]

APPENDIX

FREUD'S VIEWS ON PHOBIAS

Freud's earliest approach to the problem of phobias was in his first paper on the [83]
neuropsychoses of defence (1894*a*); he dealt with it rather more fully a year later in the second section of the present paper and alluded to it again in the first paper on anxiety neurosis (1895*b*) which he wrote very shortly afterwards. The topic is addressed once more in his (1895*h*) lecture. In all these early discussions of phobias it is not hard to detect some uncertainty; indeed, in a further brief reference to the question in the second paper on anxiety neurosis (1895*f*) Freud speaks of the mechanism of phobias as 'obscure' (p. 118 below). In the earliest of these papers he had attributed the same mechanism to 'the great majority of phobias and obsessions' (p. 53 f.), while excepting the 'purely hysterical phobias' (p. 53) and 'the group of typical phobias, of which agoraphobia is a model' (p. 53 *n.* 2). This latter distinction, making its first appearance in a footnote, was to prove the crucial one, for it implied a distinction between phobias having a psychical basis and those (the 'typical' ones) without any. This distinction thus linked up with that between what were later to be known as the psychoneuroses and the 'actual neuroses' (see p. 273 *n.* 1). In these early papers, however, the distinction was not consistently drawn. Thus, in the present paper and in the (1895*h*) lecture (p. 117 f.), it seems to be made not between two different groups of phobias (as in the earlier paper) but between the (psychically based) 'obsessions' on the one hand and the (non-psychically based) 'phobias' on the other, the latter being declared to be 'a part of the anxiety neurosis' (pp. 73–4). Here, however, and once more in the (1895*h*) lecture (p. 131) the picture is confused by the further division of phobias into two groups according to the nature of their objects (p. 73), and moreover by the segregation (as in the first paper) of another class of phobias 'which might be called traumatic' and which are 'allied to the symptoms of hysteria' (p. 67). Further, in the paper on anxiety neurosis the main distinction was not between obsessions and phobias, as it is here and in the (1895*h*) lecture, but once again between phobias belonging to obsessional neurosis and those belonging to anxiety neurosis [84]
(pp. 86–7): though once again the distinction was between the presence or absence of a psychical basis. In these papers, therefore, there remained undetermined links between phobias, hysteria, obsessions and anxiety neurosis.

Apart from a very few scattered allusions, the subject of phobias seems not to have been discussed by Freud after the present group of papers for nearly fifteen years. Then, in the case history of 'Little Hans' (1909*b*), the first step was taken towards clearing up these obscurities by the introduction of a fresh clinical entity – 'anxiety hysteria' (*RSE*, **10**, 88–90).[1] Freud there observed that phobias 'should only be

1 Freud actually introduced the term at a meeting of the Vienna Psychoanalytical Society on October 9, 1907. (See Addendum to Editors' footnote, *RSE*, **9**, 221 *n.* 2.)

regarded as syndromes which may form part of various neuroses and that we need not rank them as an independent pathological process'; and he went on to propose the name of 'anxiety hysteria' for one particular type of phobia whose mechanism resembled that of hysteria. It was in this case history and in the later one of the 'Wolf Man' (1918*b* [1914]), *RSE*, **17**, that Freud gave his fullest clinical account of phobias – both of them, of course, occurring in children. A little later, in his metapsychological papers on 'Repression' and 'The Unconscious' (1915*d* and *e*), he entered into a detailed discussion of the metapsychology of the mechanism that produces phobias, whether related to hysteria or to obsessional neurosis (ibid., **14**, 137–9 and 161–4). There remained, however, the problem, going back to the earliest of the present set of papers, of the 'typical' phobias of anxiety neurosis. Here, as we have seen, the whole question of the 'actual neuroses' was involved; and this was not to be fully elucidated until later still, in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, of which the core is a reconsideration of the phobias of 'Little Hans' and the 'Wolf Man'.

Included (No. XXXII) in Freud's own collection of abstracts of his early works (1897*b*). The present translation is a revised and corrected reprint of the *SE* version.

This paper may be regarded as the first stretch of a trail that led, with more than one bifurcation and more than one sharp turning, through the whole of Freud's writings. But, as may be seen from the list of works dealing with anxiety[1] printed as an Appendix to *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 155, this is not, strictly speaking, the beginning of the trail. It was preceded by several exploratory starts in the form of drafts submitted by Freud to Wilhelm Fliess (particularly in Drafts A, [88] B and E). Thus, in Section II of Draft B dated February 8, 1893 (Freud, 1950*a*;

1 Some notes on the English translation of the German word '*Angst*' are given in an Editors' Appendix below (p. 104). See also *RSE*, **24**, 56–7.

RSE, **1**, 210 f.), some of the main points of the present paper are already summarized. In particular, the need to 'detach' anxiety neurosis from neurasthenia is insisted upon and many of the symptoms are enumerated much as they are here. On the other hand, this draft contains no indication of the deeper aetiology of the neurosis as it is proposed in the present paper – the accumulation of sexual excitation which is unable to find discharge in the psychical field. For this we have to turn to Draft E (ibid., **1**, 217 ff.), where the theory is stated fully and perhaps even more clearly than it is below. Unluckily Draft E is not dated. The editors of the Fliess correspondence assign it for no very convincing reason to June, 1894; but in any case it must evidently have been written before, and not very long before, this paper. Some of the obscurities here have light thrown upon them by this draft and also by Draft G (also undated, but certainly contemporary with the present work), which includes a remarkable diagram depicting Freud's ideas on the mechanism of the sexual process (ibid., **1**, 230). Also of interest in this connection are the Two Contemporary Reports of a Three-Part Lecture 'On Hysteria' (Freud, 1895*g*; *RSE*, **2**, 291–308). These lectures were delivered in October, 1895.

It is advisable to bear in mind in reading these early papers that Freud was at the time deeply involved in an attempt to cast the data of psychology in neurological terms – an attempt which culminated in his abortive 'Project for a Scientific Psychology' (1950*a*, written in the autumn of 1895, a few months after the drafts sent to Fliess, but, like them, only posthumously published) and which thereafter foundered completely. (Cf. above, p. 58.) He had not yet wholly adopted the hypothesis of there being unconscious mental processes (as is seen from a sentence in his earlier paper on 'The Neuropsychoses of Defence', p. 50). Thus, in the present paper he distinguishes between 'somatic sexual excitation' on the one hand and 'sexual libido, or psychical desire' on the other (p. 96). 'Libido' is regarded as something exclusively 'psychical', though, again, no clear distinction seems yet to have been made between 'psychical' and 'conscious'. It is interesting to note that in the abstract of this paper which Freud himself wrote only a couple of years later (1897*b*), p. 249 f. below, he evidently already accepts the view of libido as something potentially unconscious and writes: 'Neurotic anxiety is transformed sexual libido.'

[89] But in whatever terms he expressed this theory, it was one which he held till very late in life, though with a number of qualifying complications. For a long series of changing opinions lay ahead, some account of which can be found in the Editors' Introduction (in Volume 20 of the *Revised Standard Edition*) to the last of his major works on the subject, *Inhibitions, Symptoms and Anxiety* (1926*d*). But in the meantime he was faced with an immediate controversy with a sceptical acquaintance, the psychiatrist Löwenfeld of Munich, and the paper which follows this one was the result.

ON THE GROUNDS FOR DETACHING A PARTICULAR SYNDROME FROM NEURASTHENIA UNDER THE DESCRIPTION 'ANXIETY NEUROSIS'

[INTRODUCTION]

It is difficult to make any statement of general validity about neurasthenia, so long as we use that name to cover all the things which Beard[1] has included under it. In my opinion, it can be nothing but a gain to neuropathology if we make an attempt to separate from neurasthenia proper all those neurotic disturbances in which, on the one hand, the symptoms are more firmly linked to one another than to the typical symptoms of neurasthenia (such as intracranial pressure, spinal irritation, and dyspepsia with flatulence and constipation); and which, on the other hand, exhibit essential differences in their aetiology and mechanism from the typical neurasthenic neurosis. If we accept this plan, we shall soon obtain a fairly uniform picture of neurasthenia. We shall then be in a position to differentiate from genuine neurasthenia more sharply than has hitherto been possible various pseudo-neurasthenias (such as the clinical picture of the organically determined nasal reflex neurosis,[2] the nervous disorders of the cachexias and arteriosclerosis, the preliminary stages of general paralysis of the insane, and of some psychoses). Further, it will be possible – as Moebius has proposed – to eliminate some of the *status nervosi* [nervous conditions] of hereditarily degenerate individuals; and we shall also discover reasons why a number of neuroses which are today described as neurasthenia – in particular, neuroses of an intermittent or periodical nature – ought rather to be included under melancholia. But the most marked change of all will be introduced if we decide to detach from neurasthenia the syndrome which I propose to describe in the following pages and which satisfies especially fully the conditions set out above. The symptoms of this syndrome are clinically [90] [91]

1 [G. M. Beard (1839–83), the American neurologist, was regarded as the principal exponent of neurasthenia. Cf. Beard, 1881 and 1884.]

2 [This was a clinical entity proposed by Fliess (1892 and 1893) and impressed by him upon Freud (cf. Freud, 1950*a*, Draft C).]

much more closely related to one another than to those of genuine neurasthenia (that is, they frequently appear together and they replace one another in the course of the illness); and both the aetiology and the mechanism of this neurosis are fundamentally different from the aetiology and mechanism of genuine neurasthenia as it will be left after this separation has been effected.

I call this syndrome 'anxiety neurosis' [*Angstneurose*],[1] because all its components can be grouped round the chief symptom of anxiety [*Angst*][T], because each one of them has a definite relationship to anxiety. I thought that this view [*Auffassung*][T] of the symptoms of anxiety neurosis had originated with me, until an interesting paper by E. Hecker (1893) came into my hands, in which I found the same interpretation expounded with all the clarity and completeness that could be desired.[2] Nevertheless, although Hecker recognizes certain symptoms as equivalents or rudiments of an anxiety attack, he does not separate them from the domain of neurasthenia, as I propose to do. But this is evidently due to his not having taken into account the difference between the aetiological determinants in the two cases. When this latter difference is recognized there is no longer any necessity for designating anxiety symptoms by the same name as genuine neurasthenic ones; for the principal purpose of giving what is otherwise an arbitrary name is to make it easier to lay down general statements.

I. THE CLINICAL SYMPTOMATOLOGY OF ANXIETY NEUROSIS

[92] What I call 'anxiety neurosis' may be observed in a completely developed form or in a rudimentary one, in isolation or combined with other neuroses. It is of course the cases which are in some degree complete and at the same time isolated which give particular support to the impression that anxiety neurosis is a clinical entity. In other cases, where the syndrome corresponds to a '*mixed* neurosis', we are faced with the task of picking out and separating those symptoms which belong, not to neurasthenia or hysteria, and so on, but to anxiety neurosis.

1 [This was the first time Freud used the word in German in a published work. (He had already used it in French, p. 73 above.) He had been using the term at least as early as February 8, 1893, in his letters to Fliess (cf. Freud, 1950*a*, Draft B; *RSE*, **1**, 210). According to Löwenfeld (1904, 479), both the concept and the term are due to Freud. An attempt had been made a little time earlier by Wernicke (1894) to distinguish an anxiety *psychosis*.]

2 Anxiety is actually brought forward as one of the principal symptoms of neurasthenia in a work by Kaan (1893).

The clinical picture of anxiety neurosis comprises the following symptoms:

(1) *General irritability*. This is a common nervous symptom and as such belongs to many *status nervosi*. I mention it here because it invariably appears in anxiety neurosis and is important theoretically. Increased irritability [*Reizbarkeit*] always points to an accumulation of excitation [*Erregung*][T] or an inability to tolerate such an accumulation – that is, to an *absolute* or a *relative* accumulation of excitation. One manifestation of this increased irritability seems to me to deserve special mention; I refer to *auditory hyperaesthesia*, to an oversensitiveness to noise – a symptom which is undoubtedly to be explained by the innate intimate relationship between auditory impressions and fright [*Erschrecken*]. Auditory hyperaesthesia frequently turns out to be a cause of *sleeplessness*, of which more than one form belongs to anxiety neurosis.

(2) *Anxious expectation*. I cannot better describe the condition I have in mind than by this name and by adding a few examples. A woman, for instance, who suffers from anxious expectation will think of influenzal pneumonia every time her husband coughs when he has a cold, and, in her mind's eye, will see his funeral go past; if, when she is coming towards the house, she sees two people standing by her front door, she cannot avoid thinking that one of her children has fallen out of the window; when she hears the bell ring, it is someone bringing news of a death, and so on – while on all these occasions there has been no particular ground for exaggerating a mere possibility.

Anxious expectation, of course, shades off imperceptibly into normal [93]
anxiety, comprising all that is ordinarily spoken of as anxiousness – or a tendency to take a pessimistic view of things; but at every opportunity it goes beyond a plausible anxiousness of this kind, and it is frequently recognized by the patient himself as a kind of compulsion. For one form of anxious expectation – that relating to the subject's own health – we may reserve the old term *hypochondria*. The height reached by the hypochondria is not always parallel with the general anxious expectation; it requires as a precondition the existence of paraesthesias and distressing bodily sensations. Thus hypochondria is the form favoured by genuine neurasthenics when, as often happens, they fall victim to anxiety neurosis.[1]

1 [Freud made some further remarks on the relation of hypochondria to the other neuroses in his contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 230. He returned to the subject much later, particularly in Section II of his paper on narcissism (1914*c*), ibid., **14**, 72–3.]

A further expression of anxious expectation is no doubt to be found in the inclination to *moral anxiety*,[1] to scrupulousness and pedantry – an inclination which is so often present in people with more than the usual amount of moral sensitiveness and which likewise varies from the normal to an exaggerated form in *doubting mania*.

Anxious expectation is the nuclear symptom of the neurosis. It openly reveals, too, a portion of the theory of the neurosis. We may perhaps say that here a *quantum of anxiety in a freely floating state* is present, which, where there is expectation, controls the choice of ideas [*Vorstellungen*][T] and is always ready to link itself with any suitable ideational content.

(3) But anxiousness – which, though mostly latent as regards consciousness, is constantly lurking in the background – has other means of finding expression besides this. It can suddenly break through into consciousness without being aroused by a train of ideas, and thus provoke an *anxiety attack*. An anxiety attack of this sort may consist of the feeling of anxiety, alone, without any associated idea, or accompanied by the interpretation [*Deutung*][T] that is nearest to hand, such as ideas of the
[94] extinction of life, or of a stroke, or of a threat of madness; or else some kind of paraesthesia (similar to the hysterical aura[2]) may be combined with the feeling of anxiety, or, finally, the feeling of anxiety may have linked to it a disturbance of one or more of the bodily functions – such as respiration, heart action, vasomotor innervation or glandular activity. From this combination the patient picks out in particular now one, now another, factor. He complains of 'heart spasms', 'difficulty in breathing', 'outbreaks of sweating', 'ravenous hunger', and such like; and, in his description, the feeling of anxiety often recedes into the background or is referred to quite unrecognizably as 'being unwell', 'feeling uncomfortable' [*Unbehagen*], and so on.

(4) Now it is an interesting fact, and an important one from a diagnostic point of view, that the proportion in which these elements are mixed in an anxiety attack varies to a remarkable degree, and that almost every accompanying symptom alone can constitute the attack just as well as can the anxiety itself. There are consequently *rudimentary anxiety attacks* and *equivalents of anxiety attacks*, all probably having the same significance, which exhibit a great wealth of forms that has as yet been little appreciated. A closer study of these larval anxiety states (as Hecker

1 ['*Gewissensangst*', literally 'conscience anxiety'. This was to be a principal topic in some of Freud's latest writings – for instance, in *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 113 f., and in Chapters VII and VIII of *Civilization and its Discontents* (1930*a*), ibid., **21**, 115 f. and 128.]

2 [See footnote, p. 28 above.]

[1893] calls them) and their diagnostic differentiation from other attacks should soon become a necessary task for neuropathologists.

I append here a list which includes only those forms of anxiety attack which are known to me:

(*a*) Anxiety attacks accompanied by disturbances of the *heart action*, such as palpitation, either with transitory arrhythmia or with tachycardia of longer duration which may end in serious weakness of the heart and which is not always easily differentiated from organic heart affection; and, again, pseudo-angina pectoris – diagnostically a delicate subject!

(*b*) Anxiety attacks accompanied by disturbances of *respiration*, several forms of nervous dyspnoea, attacks resembling asthma, and the like. I would emphasize that even these attacks are not always accompanied by recognizable anxiety.

(*c*) Attacks of *sweating*, often at night. [95]

(*d*) Attacks of *tremor* and *shivering* which are only too easily confused with hysterical attacks.

(e) Attacks of *ravenous hunger*, often accompanied by vertigo.

(*f*) *Diarrhoea* coming on in attacks.

(*g*) Attacks of locomotor *vertigo*.

(*h*) Attacks of what are known as *congestions*, including practically everything that has been termed vasomotor neurasthenia.

(*i*) Attacks of *paraesthesias*. (But these seldom occur without anxiety or a similar feeling of discomfort.)

(5) *Waking up at night in a fright* (the *pavor nocturnus* of adults), which is usually combined with anxiety, dyspnoea, sweating and so on, is very often nothing else than a variant of the anxiety attack. This disturbance is the determinant of a second form of sleeplessness within the field of anxiety neurosis. [Cf. p. 83 above.] I have become convinced, moreover, that the *pavor nocturnus* of children, too, exhibits a form which belongs to anxiety neurosis. The streak of hysteria about it, the linking of the anxiety with the reproduction of an appropriate experience or a dream, causes the *pavor nocturnus* of children to appear as something special. But the *pavor* can also emerge in a pure form, without any dream or recurring hallucination.

(6) '*Vertigo*' occupies a prominent place in the group of symptoms of anxiety neurosis. In its mildest form it is best described as 'giddiness'; in its severer manifestations, as 'attacks of vertigo' (with or without anxiety), it must be classed among the gravest symptoms of the neurosis.

The vertigo of anxiety neurosis is not rotatory nor does it especially affect certain planes or directions, like Ménière's vertigo. It belongs to the class of locomotor or coordinatory vertigo, as does the vertigo in oculomotor paralysis. It consists in a specific state of discomfort, accompanied by sensations of the ground rocking, of the legs giving way and of its being impossible to stand up any more; while the legs feel as heavy as lead and tremble or the knees bend. This vertigo never leads to a fall. On the other hand, I should like to state that an attack of vertigo of this kind may have its place taken by a profound *fainting fit*. Other conditions in the nature of fainting occurring in anxiety neurosis appear to depend upon *cardiac collapse*.

[96] Attacks of vertigo are not seldom accompanied by the worst sort of anxiety, often combined with cardiac and respiratory disturbances. According to my observations, vertigo produced by heights, mountains and precipices is also often present in anxiety neurosis. Furthermore, I am not sure whether it is not also right to recognize alongside of this a *vertigo a stomacho laeso* [of gastric origin].

(7) On the basis of chronic anxiousness (anxious expectation) on the one hand, and a tendency to anxiety attacks accompanied by vertigo on the other, two groups of typical phobias develop, the first relating to general physiological dangers, the second relating to locomotion. To the first group belong fear of snakes, thunderstorms, darkness, vermin, and so on, as well as the typical moral over-scrupulousness and forms of doubting mania. Here the available anxiety is simply employed to reinforce aversions which are instinctively [*instinktiv*][T] implanted in everyone. But as a rule a phobia which acts in an obsessional [*zwangsartig*][T] manner is only formed if there is added to this the recollection of an experience in which the anxiety was able to find expression – as, for instance, after the patient has experienced a thunderstorm in the open. It is a mistake to try to explain such cases as being simply a *persistence of strong impressions*; what makes these experiences significant and the memory of them lasting is, after all, only the anxiety which was able to emerge at the time [of the experience] and which can similarly emerge now. In other words, such impressions remain powerful only in people with 'anxious expectation'.

Instinkt

Zwang

The other group includes *agoraphobia* with all its accessory forms, the whole of them characterized by their relation to locomotion. We frequently find that this phobia is based on an attack of vertigo that has preceded it; but I do not think that one can postulate such an attack in every case. Occasionally we see that after a first attack of vertigo without

anxiety, locomotion, although henceforward constantly accompanied by a sensation of vertigo, still continues to be possible without restriction; but that, under certain conditions – such as being alone or in a narrow street – when once anxiety is added to the attack of vertigo, locomotion breaks down [*versagt*]T. *Versagung*

The relation of these phobias to the phobias of obsessional neurosis, whose mechanism I made clear in an earlier paper[1] in this periodical, is [97] of the following kind. What they have in common is that in both an idea becomes obsessional as a result of being attached to an available affect. The mechanism of *transposition of affect* thus holds good for both kinds of phobia. But in the phobias of anxiety neurosis (1) this affect always has the same colour, which is that of anxiety; and (2) the affect does not originate in a repressed [*verdrängten*]T idea, but turns out to be *not further reducible by psychological analysis, nor amenable to psychotherapy*. The mechanism of *substitution*, therefore, does not hold good for the phobias of anxiety neurosis. *Verdrängung*

Both kinds of phobias (and also obsessions [*Zwangsvorstellungen*]) often appear side by side; although the *atypical* phobias, which are based on obsessions, need not necessarily spring from the soil of anxiety neurosis. A very frequent and apparently complicated mechanism makes its appearance if, in what was originally a simple phobia belonging to an anxiety neurosis, the content of the phobia is replaced by another idea, so that the substitute is *subsequent* [*nachträglich*]T to the phobia. What are most often employed as substitutes are the '*protective measures*' that were originally used to combat the phobia. Thus, for instance, 'brooding mania' [*Grübelsucht*] arises from the subject's endeavours to disprove that he is mad, as his hypochondriacal phobia maintains; the hesitations and doubt, and still more the repetitions, of *folie du doute* [doubting mania] arise from a justifiable doubt about the certainty of one's own train of thought, since one is conscious of its persistent disturbance by ideas of an obsessional sort, and so on. We can therefore assert that many syndromes, too, of obsessional neurosis, such as *folie du doute* and the like, are also to be reckoned, clinically if not conceptually, as belonging to anxiety neurosis.[2] *Nachträglichkeit*

1 'The Neuropsychoses of Defence' (1894*a*). – [The term 'obsessional neurosis (*Zwangsneurose*)' makes its first published appearance in this sentence. Freud had used it in a letter to Fliess of February 7, 1894 (Freud, 1950*a*, Letter 16). Löwenfeld (1904, 296 and 487) attributed the origin of both the term and the concept to Freud. – Cf. also the Editors' Appendix to 'Obsessions and Phobias', p. 75 above.]

2 See 'Obsessions and Phobias' (1895*c*) [p. 71 above].

(8) The digestive activities undergo only a few disturbances in anxiety neurosis; but these are characteristic ones. Sensations such as an inclination to vomit and nausea are not rare, and the symptom of ravenous
[98] hunger may, by itself or in conjunction with other symptoms (such as congestions), give rise to a rudimentary anxiety attack. As a chronic change, analogous to anxious expectation, we find an inclination to diarrhoea, and this has been the occasion of the strangest diagnostic errors. Unless I am mistaken, it is this diarrhoea to which Moebius (1894*b*) has drawn attention recently in a short paper. I suspect, further, that Peyer's reflex diarrhoea, which he derives from disorders of the prostate (Peyer, 1893), is nothing else than this diarrhoea of anxiety neurosis. The illusion of a reflex relationship is created because the same factors come into play in the aetiology of anxiety neurosis as are at work in the setting up of such affections of the prostate and similar disorders.

The behaviour of the gastrointestinal tract in anxiety neurosis presents a sharp contrast to the influence of neurasthenia on those functions. Mixed cases often show the familiar 'alternation between diarrhoea and constipation'. Analogous to this diarrhoea is the need to urinate that occurs in anxiety neurosis.

(9) The *paraesthesias* which may accompany attacks of vertigo or anxiety are interesting because they, like the sensations of the hysterical aura, become associated in a definite sequence; although I find that these associations, in contrast to the hysterical ones, are atypical and changing. A further similarity to hysteria is provided by the fact that in anxiety neurosis a kind of *conversion*[1] takes place on to bodily sensations, which may easily be overlooked – for instance, on to rheumatic muscles. A whole number of what are known as rheumatic individuals – who, moreover, can be shown to *be* rheumatic – are in reality suffering from anxiety neurosis. Along with this increase of sensitivity to pain, I have also observed in a number of cases of anxiety neurosis a tendency to *hallucinations*; and these could not be interpreted as hysterical.

(10) Several of the symptoms I have mentioned, which accompany or take the place of an anxiety attack, also appear in a chronic form. In that case they are still less easy to recognize, since the anxious sensation which goes with them is less clear than in an anxiety attack. This is especially true of diarrhoea, vertigo and paraesthesias. Just as an attack of
[99] vertigo can be replaced by a fainting fit, so chronic vertigo can be replaced by a constant feeling of great feebleness, lassitude and so on.

1 See 'The Neuropsychoses of Defence' (1894*a*) [p. 46 f. above].

II. INCIDENCE AND AETIOLOGY OF ANXIETY NEUROSIS

In some cases of anxiety neurosis no aetiology at all is to be discovered. It is worth noting that in such cases there is seldom any difficulty in establishing evidence of a grave hereditary taint.

But where there are grounds for regarding the neurosis as an *acquired* one, careful enquiry directed to that end reveals that a set of noxae and influences from *sexual life* are the operative aetiological factors.[1] These appear at first sight to be of a varied nature, but they soon disclose the common character which explains why they have a similar effect on the nervous system. Further, they are present either alone or together with other noxae of a 'stock'[2] kind, to which we may ascribe a contributory effect. This sexual aetiology of anxiety neurosis can be demonstrated with such overwhelming frequency that I venture, *for the purpose of this short paper*, to disregard those cases where the aetiology is doubtful or different.

In order that the aetiological conditions under which anxiety neurosis makes its appearance may be presented with greater accuracy, it will be advisable to consider males and females separately. In females – disregarding for the moment their innate disposition – anxiety neurosis occurs in the following cases:

(*a*) As *virginal anxiety* or *anxiety in adolescents*. A number of unambiguous observations have shown me that anxiety neurosis can be produced in girls who are approaching maturity by their first encounter with the problem of sex [*sexuellen Problem*][T], by any more or less sudden revelation of what had till then been hidden – for instance, by witnessing the sexual act, or being told or reading about these things. Such an anxiety neurosis is combined with hysteria in an almost typical fashion.[3]

Geschlecht

[100]

(*b*) As *anxiety in the newly married*. Young married women who have remained anaesthetic during their first cohabitations not seldom fall ill of an anxiety neurosis, which disappears once more as soon as the anaesthesia gives place to normal sensitivity. Since most young wives remain

1 [This passage is further discussed in connection with one of Löwenfeld's criticisms, p. 119 below.]

2 [This word has been adopted in all these early papers as a rendering of the German-French adjective '*banal*'.]

3 [Freud quoted the gist of this paragraph and added a correction (concerning 'deferred action') to it in a footnote to his second paper on the neuropsychoses of defence (1896*b*) below, p. 177 *n*. 1. The case of 'Katharina' in *Studies on Hysteria* (1895*d*) was described by Freud as an example of 'virginal anxiety'. See *RSE*, **2**, 112, 119 and 231.]

healthy where there is initial anaesthesia of this kind, it follows that, in order that this kind of anxiety shall emerge, other determinants are required; and these I will mention later.

(*c*) As anxiety in women whose husbands suffer from *ejaculatio praecox* or from markedly impaired potency; and (*d*) whose husbands practise *coitus interruptus* or *reservatus*.[1] These cases [(*c*) and (*d*)] belong together, for on analysing a great number of instances it is easy to convince oneself that they depend simply on whether the woman obtains satisfaction in coitus or not. If not, the condition for the genesis of an anxiety neurosis is given. On the other hand, she is saved from the neurosis if the husband who is afflicted with *ejaculatio praecox* is able immediately to repeat coitus with better success. *Coitus reservatus* by means of condoms is not injurious to the woman, provided she is very quickly excitable [*erregbar*] and the husband very potent; otherwise, this kind of preventive intercourse is no less injurious than the others. *Coitus interruptus* is nearly always a noxa. But for the wife it is only so if the husband practises it regardless – that is to say, if he breaks off intercourse as soon as *he* is near emission, without troubling himself about the course of the excitation in *her*. If, on the other hand, the husband waits for his wife's satisfaction, the coitus amounts to a normal one for *her*; but *he* will fall ill of an anxiety neurosis. I have collected and analysed a large number of observations, on which these assertions are based.

[101] (*e*) Anxiety neurosis also occurs as anxiety in *widows* and intentionally *abstinent women*, not seldom in a typical combination with obsessional ideas; and

(*f*) As anxiety in the *climacteric* during the last major increase of sexual need.

Cases (*c*), (*d*) and (*e*) comprise the conditions under which anxiety neurosis in the female sex [*Geschlecht*] arises most frequently and most readily, independently of hereditary disposition. It is in reference to these cases of anxiety neurosis – these curable acquired cases – that I shall try to show that the sexual [*sexuellen*] noxae discovered in them are really the aetiological factor of the neurosis.

Before doing so, however, I will discuss the sexual [*sexuellen*] determinants of anxiety neurosis in *men*. I propose to distinguish the following groups, all of which have their analogies in women:

(*a*) Anxiety of intentionally *abstinent* men, which is frequently combined with symptoms of *defence* [*Abwehr*][T] (obsessional ideas, hysteria).

1 [Freud had mentioned his belief in the harmfulness of *coitus interruptus* in a letter to Fliess as early as February 4, 1888 (Freud, 1950*a*, Letter 3).]

The motives which are responsible for intentional abstinence imply that a number of people with a hereditary disposition, eccentrics, etc., enter into this category.

(*b*) Anxiety in men in a state of *unconsummated excitation*[1] (e.g. during the period of engagement before marriage), or in those who (from fear of the consequences of sexual intercourse) content themselves with touching or looking at women. This group of determinants – which, incidentally, can be applied unaltered to the other sex (during engagements or relations in which sexual intercourse is avoided) – provides the purest cases of the neurosis.

(*c*) Anxiety in men who practise *coitus interruptus*. As has been said, *coitus interruptus* is injurious to the *woman* if it is practised without regard to her satisfaction; but it is injurious to the *man* if, in order to obtain satisfaction for her, he directs coitus voluntarily and postpones emission. In this way it becomes intelligible that when a married couple practise *coitus interruptus*, it is, as a rule, only *one* partner who falls ill. Moreover, in men *coitus interruptus* only rarely produces a pure anxiety neurosis; it usually produces a mixture of anxiety neurosis and neurasthenia.

(*d*) Anxiety in *senescent* men. There are men who have a climacteric like women, and who produce an anxiety neurosis at the time of their decreasing potency and increasing libido.[2] [102]

Finally, I must add two other cases which apply to both sexes:

(α)[3] People who, as a result of practising masturbation, have become neurasthenics,[4] fall victim to anxiety neurosis as soon as they give up their form of sexual satisfaction. Such people have made themselves particularly incapable of tolerating abstinence.

I may note here, as being important for an understanding of anxiety neurosis, that any pronounced development of that affection only occurs among men who have remained potent and women who are not anaesthetic. Among neurotics whose potency has already been severely damaged by masturbation, the anxiety neurosis resulting from

1 [‘*frustraner Erregung*.’ See footnote 1, p. 74 above.]

2 [This seems to be Freud’s first published use of the term ‘libido’. Its occurrence here contradicts his apparent statement that it was used first by Moll in 1898 (cf. Freud’s encyclopaedia article on ‘Libido’ (1923*a*), *RSE*, **18**, 247); and, indeed, at the beginning of Chapter VI of *Civilization and its Discontents* (1930*a*), ibid., **21**, 105, he mentions having introduced the term himself, presumably in the present passage. He had used it a few months earlier than this, on August 18, 1894 (Freud, 1950*a*, Draft F) or perhaps earlier still (Draft E; see *RSE*, **1**, 224, 220).]

3 [In the editions previous to 1925 this and the next class of cases were marked ‘*e*’ and ‘*f*’ instead of ‘α’ and ‘β’.]

4 [See below, p. 98 *n*. 1.]

abstinence is very slight and is mostly restricted to hypochondria and mild chronic vertigo. The majority of women, indeed, are to be regarded as 'potent'; a really impotent – i.e. a really anaesthetic – woman is in a similar way little susceptible to anxiety neurosis, and she tolerates the noxae I have described remarkably well.

How far, in addition to this, we are justified in postulating any constant relation between particular aetiological factors and particular symptoms in the complex of anxiety neurosis, I should not like to discuss as yet in this paper.

(*β*) The last of the aetiological conditions I have to bring forward appears at first sight not to be of a sexual nature at all. Anxiety neurosis also arises – and in both sexes – as a result of the factor of overwork or exhausting exertion – as, for instance, after nightwatching, sick-nursing, or even after severe illness.

[103] The main objection to my postulate of a sexual aetiology for anxiety neurosis will probably be to the following effect. Abnormal conditions in sexual life of the kind I have described are found so extremely frequently that they are bound to be forthcoming wherever one looks for them. Their presence in the cases of anxiety neurosis which I have enumerated does not, therefore, prove that we have unearthed in them the aetiology of the neurosis. Moreover, the number of people who practise *coitus interruptus* and the like is incomparably larger than the number who are afflicted with anxiety neurosis, and the great majority of the former tolerate this noxa very well.

To this I must reply in the first place that, considering the admittedly enormous frequency of the neuroses and especially of anxiety neurosis, it would certainly not be right to expect to find an aetiological factor for them that is of *rare* occurrence; in the second place, that a postulate of pathology is in fact satisfied, if in an aetiological investigation it can be shown that the *presence* of an aetiological factor is more frequent than its effects, since, in order for these latter to occur, other conditions may have to exist in addition (such as disposition, summation of specific aetiological elements, or reinforcement by other, stock noxae);[1] and further, that a detailed dissection of suitable cases of anxiety neurosis proves beyond question the importance of the sexual factor. I will confine myself here, however, to the single aetiological factor of *coitus interruptus* and to bringing out certain observations which confirm it.

1 [This argument is more clearly stated in a later paper (1896*c*), p. 214 f. below.]

(1) So long as an anxiety neurosis in young married women is not yet established, but only appears in bouts and disappears again spontaneously, it is possible to demonstrate that each such bout of the neurosis is traceable to a coitus which was deficient in satisfaction. Two days after this experience – or, in the case of people with little resistance, the day after – the attack of anxiety or vertigo regularly appears, bringing in its train other symptoms of the neurosis. All this vanishes once more, provided that marital intercourse is comparatively rare. A chance absence of the husband from home, or a holiday in the mountains which necessitates a separation of the couple, has a good effect. The gynaecological treatment which is usually resorted to in the first instance is beneficial because, while it lasts, marital intercourse is stopped. Curiously enough [104]
the success of local treatment is only transitory; the neurosis sets in again in the mountains, as soon as the husband begins his holiday too; and so on. If, as a physician who understands this aetiology, one arranges, in a case in which the neurosis has not yet been established, for *coitus interruptus* to be replaced by normal intercourse, one obtains a *therapeutic* proof of the assertion I have made. The anxiety is removed, and – unless there is fresh cause for it of the same sort – it does not return.

(2) In the anamneses of many cases of anxiety neurosis we find, both in men and women, a striking oscillation in the intensity of its manifestations, and, indeed, in the coming and going of the whole condition. One year, they will tell you, was almost entirely good, but the next one was dreadful; on one occasion the improvement seemed to be due to a particular treatment, which, however, turned out to be quite useless at the next attack; and so on. If we enquire into the number and sequence of the children and compare this record of the marriage with the peculiar history of the neurosis, we arrive at the simple solution that the periods of improvement or good health coincided with the wife's pregnancies, during which, of course, the need for preventive intercourse was no longer present. The husband benefited by the treatment after which he found his wife pregnant – whether he received it from Pastor Kneipp[1] or at a hydropathic establishment.

(3) The anamnesis of patients often discloses that the symptoms of anxiety neurosis have at some definite time succeeded the symptoms of some other neurosis – neurasthenia, perhaps – and have taken their place. In these instances it can quite regularly be shown that, shortly

1 [The episode to which this refers is described in detail in a later paper 'Sexuality in the Aetiology of the Neuroses' (1898*a*), p. 267 f. below.]

before this change of the picture, a corresponding change has occurred in the form of the sexual noxa.

Observations of this sort, which can be multiplied at will, positively thrust a sexual aetiology on the doctor for a certain category of cases. And other cases, which would otherwise remain unintelligible, can at least be understood and classified without inconsistency by employing
[105] that aetiology as a key. I have in mind those very numerous cases in which, it is true, everything is present that has been found in the previous category – on the one hand the manifestations of anxiety neurosis, and on the other the specific factor of *coitus interruptus* – but in which something else as well intrudes itself: namely, a long interval between the presumed aetiology and its effects, and also perhaps aetiological factors that are not of a sexual nature. Take, for instance, a man who, on receiving news of his father's death, had a heart attack and from that moment fell victim to an anxiety neurosis. The case is not comprehensible, for, till then, the man was not neurotic. The death of his father, who was well advanced in years, did not take place under in any way special circumstances, and it will be admitted that the normal and expected decease of an aged father is not one of those experiences which usually cause a healthy adult to fall ill. Perhaps the aetiological analysis will become clearer if I add that this man had been practising *coitus interruptus* for eleven years, with due consideration for his wife's satisfaction. The clinical symptoms are, at least, exactly the same as those which appear in other people after only a short sexual noxa of the same kind, and without the interpolation of any other trauma.[1] A similar assessment must be made of the case of a woman whose anxiety neurosis broke out after the loss of her child, or of the student whose preparatory studies for his final examination were interfered with by an anxiety neurosis. I think that in these instances, too, the effect is not explained by the ostensible aetiology. One is not necessarily 'overworked' by study,[2] and a healthy mother as a rule reacts only with normal grief to the loss of a child. Above all, however, I should have expected the student, as a result of his overwork, to acquire cephalasthenia,[3] and the mother, as a result of her bereavement, hysteria. That both should have been overtaken by anxiety neurosis leads me to attach importance to the fact that the mother had

1 [This case and that of the student below are referred to again in the second paper on anxiety neurosis (1895*f*), p. 113 below. Freud had described the former briefly in a letter to Fliess of October 6, 1893 (Freud, 1950*a*, Letter 14).]

2 [Cf. some discussion of 'overwork' in the later paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), p. 267 below.]

3 [In referring to this same case below (p. 113), Freud uses the term 'cerebral neurasthenia'.]

been living for eight years in conditions of marital *coitus interruptus*, and that the student had for three years had an ardent love affair with a 'respectable' girl whom he had to avoid making pregnant. [106]

These considerations lead us to the conclusion that the specific sexual noxa of *coitus interruptus*, even when it is not able on its own account to provoke an anxiety neurosis in the subject, does at least *dispose* him to acquire it. The anxiety neurosis breaks out as soon as there is added to the latent effect of the specific factor the effect of another, stock noxa. The latter can act in the sense of the specific factor quantitatively but cannot replace it qualitatively. The specific factor always remains decisive for the *form* taken by the neurosis. I hope to be able to prove this assertion concerning the aetiology of the neuroses more comprehensively too.

In addition, these latter remarks contain an assumption which is not in itself improbable, to the effect that a sexual noxa like *coitus interruptus* comes into force through summation. A shorter or longer time is needed – depending on the individual's disposition and any other inherited weaknesses of his nervous system – before the effect of this summation becomes visible. Those individuals who apparently tolerate *coitus interruptus* without harm, in fact, become disposed by it to the disorders of anxiety neurosis, and these may break out at some time or other, either spontaneously or after a stock trauma which would not ordinarily suffice for this; just as, by the path of summation, a chronic alcoholic will in the end develop a cirrhosis or some other illness, or will, under the influence of a fever, fall victim to delirium.[1]

III. FIRST STEPS TOWARDS A THEORY OF ANXIETY NEUROSIS

The following theoretical discussion can only claim to have the value of a first, groping attempt; criticism of it ought not to affect an acceptance of the *facts* which have been brought forward above. Moreover, an assessment of this 'theory of anxiety neurosis' is made the more difficult from being only a fragment of a more comprehensive account of the neuroses. [107]

What we have so far said about anxiety neurosis already provides a few starting points for gaining an insight into the mechanism of this

1 [Cf. below, p. 115. The 'summation' of traumas in cases of hysteria had been discussed by Freud in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 154–5. The importance of summation in the aetiology of migraine was strongly emphasized by him in an unpublished paper of about this date. See Freud, 1950*a*, Draft I; ibid., **1**, 241. Cf. p. 118 below.]

neurosis. In the first place there was our suspicion that we had to do with an accumulation of excitation [p. 83 above]; and then there was the extremely important fact that the anxiety which underlies the clinical symptoms of the neurosis can be traced to *no psychical origin*. Such an origin would exist, for instance, if it was found that the anxiety neurosis was based on a single or repeated justifiable fright, and that that fright had since provided the source for the subject's readiness for anxiety. But this is not so. Hysteria or a traumatic neurosis can be acquired from a single fright, *but never* anxiety neurosis. Since *coitus interruptus* takes such a prominent place among the causes of anxiety neurosis, I thought at first that the source of the continuous anxiety might lie in the fear, recurring every time the sexual act was performed, that the technique might go wrong and conception consequently take place. But I have found that this state of feeling, either in the man or the woman, during *coitus interruptus* has no influence on the generation of anxiety neurosis, that women who are basically indifferent about the consequence of a possible conception are just as liable to the neurosis as those who shudder at the possibility, and that everything depends simply on which partner has forfeited satisfaction in this sexual technique.

A further point of departure is furnished by the observation, not so far mentioned, that in whole sets of cases anxiety neurosis is accompanied by a most noticeable decrease of sexual libido[I] or *psychical desire* [*Lust*][T], so that on being told that their complaint results from 'insufficient satisfaction', patients regularly reply that that is impossible, for precisely now all sexual need has become extinguished in them. From all these indications – that we have to do with an accumulation of excitation; that the anxiety which probably corresponds to this accumulated excitation is of somatic origin, so that what is being accumulated is a *somatic* excitation; and, further, that this somatic excitation is of a sexual nature and
[108] that a decrease of *psychical* participation in the sexual processes goes along with it – all these indications, I say, incline us to expect that *the mechanism of anxiety neurosis is to be looked for in a deflection of somatic sexual excitation from the psychical sphere, and in a consequent abnormal employment of that excitation*.

This concept of the mechanism of anxiety neurosis can be made clearer if one accepts the following view of the sexual process, which applies, in the first instance, to men. In the sexually mature male organism somatic sexual excitation is produced – probably continuously – and periodically becomes a stimulus to the psyche. In order to make our

1 [See Editors' Note, p. 80 above.]

ideas on this point firmer, I will add by way of interpolation that this somatic excitation is manifested as a pressure on the walls of the seminal vesicles, which are lined with nerve-endings; thus this visceral excitation will develop continuously, but it will have to reach a certain height before it is able to overcome the resistance of the intervening path of conduction to the cerebral cortex and express itself as a psychical stimulus.[1] When this has happened, however, the group of sexual ideas which is present in the psyche becomes supplied with energy[2] and there comes into being the psychical state of libidinal tension which brings with it an urge to remove that tension. A psychical unloading [*Entlastung*][T] of this kind is only possible by means of what I shall call *specific* or *adequate* action.[3] This adequate action consists, for the male sexual drive [*Sexualtrieb*][T], in a complicated spinal reflex act which brings about the unloading of the nerve-endings, and in all the psychical preparations which have to be made in order to set off that reflex. Anything other than the adequate action would be fruitless, for once the somatic sexual excitation has reached threshold value it is turned continuously into psychical excitation, and something must positively take place which will free the nerve-endings from the load of pressure on them – which will, accordingly, remove the whole of the existing somatic excitation and allow the subcortical path of conduction to re-establish its resistance. [109]

entlasten

Trieb

I shall refrain [*versagen*] from describing more complicated instances of the sexual process in a similar way. I will only state that in essentials this formula is applicable [*zu übertragen*] to women as well, in spite of the confusion introduced into the problem by all the artificial retarding and stunting of the female sexual drive [*Geschlechtstriebes*]. In women too we must postulate a somatic sexual excitation and a state in which this excitation becomes a psychical stimulus – libido – and provokes the urge to the specific action to which voluptuous feeling is attached. Where women are concerned, however, we are not in a position to say what the process analogous to the relaxation of tension of the seminal vesicles may be.

We can include within the framework of this description of the sexual process not only the aetiology of anxiety neurosis but that of genuine neurasthenia. Neurasthenia develops whenever the adequate unloading

1 [This theory of the process of sexual excitation was stated again by Freud in Section 2 of the third of his *Three Essays* (1905*d*), *RSE*, **7**, 188 f.; but he there also stated certain objections to it.]

2 [See footnote 1, p. 46 above.]

3 [This whole account can be found repeated in similar terms in Draft E, 'How Anxiety Originates', in the Fliess correspondence (Freud, 1950*a*), *RSE*, **1**, 217 ff. It is further illustrated by a diagram in Draft G; ibid., **1**, 230. Cf. Editors' Note, p. 80 above.]

(the adequate action) is replaced by a less adequate one – thus, when normal coition, carried out in the most favourable conditions, is replaced by masturbation or spontaneous emission.[1] Anxiety neurosis, on the other hand, is the product of all those factors which prevent the somatic sexual excitation from being worked over psychically.[2] The manifestations of anxiety neurosis appear when the somatic excitation which has been deflected from the psyche is expended subcortically in totally inadequate reactions.[3]

I will now attempt to discover whether the aetiological conditions for anxiety neurosis which I set out above [p. 89 ff.] exhibit the common character that I have just attributed to them. The first aetiological factor I postulated for men was intentional abstinence [p. 90 f.]. Abstinence consists in the withholding [*Versagung*] of the specific action which ordinarily follows upon libido. Such withholding may have two consequences. In the first place, the somatic excitation accumulates; it is then deflected
[110] into other paths, which hold out greater promise of discharge [*Entladung*] than does the path through the psyche. Thus the libido will in the end sink, and the excitation will manifest itself subcortically as anxiety. In the second place, if the libido is *not* diminished, or if the somatic excitation is expended, by a shortcut, in emissions, or if, in consequence of being forced back, the excitation really ceases, then all kinds of things other than an anxiety neurosis will ensue. Abstinence, then, leads to anxiety neurosis in the manner described above. But it is also the operative agent in my second aetiological group, that of unconsummated excitation [p. 91]. My third group, that of *coitus reservatus* with consideration for the woman [ibid.], operates by disturbing the man's psychical preparedness for the sexual process, in that it introduces alongside of the task of mastering the sexual affect another psychical task, one of a deflecting sort. In consequence of this psychical deflection, once more, libido gradually disappears, and the further course of things is then the same as in the case of abstinence. Anxiety in senescence (the male climacteric) [p. 91] requires another explanation. Here there is no diminution of libido; but, as in the female climacteric, so great an increase occurs in the production of somatic excitation that the psyche proves relatively insufficient to master it.

1 [The role of masturbation in the aetiology of neurasthenia is briefly mentioned in the paper on 'Heredity and the Aetiology of the Neuroses' (1896*a*), p. 159 below; but the subject is somewhat more fully discussed in a later work, 'Sexuality in the Aetiology of the Neuroses' (1898*a*), p. 269 f. below.]

2 [Freud was still able to repeat these words with approval in Chapter VIII of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 125.]

3 [Freud appears here to equate the psyche with the cortex, and by implication with consciousness. Cf. Editors' Note, p. 80 above.]

The aetiological conditions applying to women can be brought into the framework of my scheme with no greater difficulties than in the case of men. Virginal anxiety [p. 89 above] is a particularly clear example. For here the groups of ideas to which the somatic sexual excitation should become attached are not yet enough developed. In the newly married woman who is anaesthetic [p. 89 f.], anxiety only appears if the first cohabitations arouse a sufficient amount of somatic excitation. When the local indications of such excitement (spontaneous sensations of stimulation, desire to micturate and so on) are lacking, anxiety is also absent. The case of *ejaculatio praecox* and of *coitus interruptus* [p. 90] can be explained on the same lines as in men, namely that the libidinal desire for the psychically unsatisfying act gradually disappears, while the excitation which has been aroused during the act is expended subcortically. The *alienation* between the somatic and the psychical sphere[I] in the course taken by sexual excitation is established more readily and is more difficult [III] to remove in women than in men. The cases of widowhood and of voluntary abstinence, and also that of the climacteric [p. 90], are dealt with in the same way in both sexes; but where abstinence is concerned there is in the case of women no doubt the further matter of intentional repression [*Verdrängung*][T] of the sexual circle of ideas, to which an abstinent woman, in her struggle against temptation, must often make up her mind. The horror which, at the time of the menopause, an ageing woman feels at her unduly increased libido may act in a similar sense.

The two last aetiological conditions on our list seem to fall into place without difficulty. The tendency to anxiety in masturbators who have become neurasthenic [p. 91 f.] is explained by the fact that it is very easy for them to pass into a state of 'abstinence' after they have been accustomed for so long to discharging even the smallest quantity of somatic excitation, faulty though that discharge is. Finally, the last case – the generation of anxiety neurosis through severe illness, overwork, exhausting sick-nursing, etc. [p. 92] – finds an easy interpretation when brought into relation with the effects of *coitus interruptus*. Here the psyche, on account of its deflection, would seem to be no longer capable of mastering the somatic excitation, a task on which, as we know, it is continuously engaged. We are aware to what a low level libido can sink under these conditions; and we have here a good example of a neurosis which, although it exhibits *no sexual aetiology, nevertheless exhibits a sexual mechanism*.

1 [The phrase is found towards the end of Draft E and in the discussion of Case 1 in Draft F of the Fliess papers (1950*a*), *RSE*, **1**, 221 f. and 225.]

The view here developed depicts the symptoms of anxiety neurosis as being in a sense *surrogates* of the omitted specific action following on sexual excitation. In further support of this view, I may point out that in normal copulation too the excitation expends itself, among other things, in accelerated breathing, palpitation, sweating, congestion, and so on. In the corresponding anxiety attacks of our neurosis we have before us the dyspnoea, palpitations, etc. of copulation in an isolated and exaggerated form.[1]

[112] A further question may be asked. Why, under such conditions of psychical insufficiency in mastering sexual excitation, does the nervous system find itself in the peculiar affective state of *anxiety*? An answer may be suggested as follows. The psyche finds itself in the *affect* of anxiety if it feels unable to deal by appropriate reaction with a task (a danger) *approaching from outside*; it finds itself in the *neurosis* of anxiety if it notices that it is unable to even out the (sexual) excitation originating *from within* – that is to say, *it behaves as though it were projecting* [*projizierte*] *that excitation outwards*. The affect and its corresponding neurosis are firmly related to each other. The first is a reaction to an exogenous excitation, the second a reaction to the analogous endogenous one. The affect is a state which passes rapidly, the neurosis is a chronic one; because, while exogenous excitation operates with a single impact, the endogenous excitation operates as a constant force.[2] *In the neurosis, the nervous system is reacting against a source of excitation which is internal, whereas in the corresponding affect it is reacting against an analogous source of excitation which is external.*

IV. RELATION TO OTHER NEUROSES

There are still a few words to be said about the relations of anxiety neurosis to the other neuroses as regards their onset and their internal connections.

The purest cases of anxiety neurosis are usually the most marked. They are found in sexually potent youthful individuals, with an undivided aetiology, and an illness that is not of too long standing.

1 [This theory, already put forward in Draft E of the Fliess papers (Freud, 1950*a*), was brought up again by Freud in Chapter II of the 'Dora' case history (1905*e*), *RSE*, **7**, 71. Later on, in Chapter VIII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 117–18, he related these same symptoms of anxiety to the accompaniments of birth.]

2 [Freud stated this again twenty years later in almost identical words, except that instead of 'exogenous excitation' and 'endogenous excitation' he spoke of 'stimulus' and 'drive'. See the metapsychological paper on 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 104.]

More often, however, symptoms of anxiety occur at the same time as, and in combination with, symptoms of neurasthenia, hysteria, obsessions or melancholia. If we were to allow ourselves to be restrained by a clinical intermixture like this from acknowledging anxiety neurosis as an independent entity, we ought, logically, also to abandon once more the [113] separation which has been so laboriously achieved between hysteria and neurasthenia.

For the purposes of analysing 'mixed neuroses' I can state this important truth: *Wherever a mixed neurosis is present, it will be possible to discover an intermixture of several specific aetiologies*.

A multiplicity of aetiological factors such as this, which determine a mixed neurosis, may occur purely fortuitously. For instance, a fresh noxa may add its effects to those of an already existing one. Thus, a woman who has always been hysterical may begin at a certain point in her marriage to experience *coitus reservatus*; she will then acquire an anxiety neurosis in addition to her hysteria. Or again, a man who has hitherto masturbated and has become neurasthenic may get engaged and become sexually excited by his fiancée; his neurasthenia will now be joined by a new anxiety neurosis.

In other cases the multiplicity of aetiological factors is by no means fortuitous: one of the factors has brought the other into operation. For example, a woman with whom her husband practises *coitus reservatus* without regard to her satisfaction may find herself compelled to masturbate in order to put an end to the distressing excitation that follows such an act; as a result, she will produce, not an anxiety neurosis pure and simple, but an anxiety neurosis accompanied by symptoms of neurasthenia. Another woman suffering from the same noxa may have to fight against lascivious images against which she tries to defend herself; and in this way she will, through the *coitus interruptus*, acquire obsessions as well as an anxiety neurosis. Finally, as a result of *coitus interruptus*, a third woman may lose her affection for her husband and feel an attraction for another man, which she carefully keeps secret; in consequence, she will exhibit a mixture of anxiety neurosis and hysteria.

In a third category of mixed neuroses the interconnection between the symptoms is still more intimate, in that the same aetiological determinant regularly and simultaneously provokes both neuroses. Thus, for instance, the sudden sexual enlightenment, which we have found present in virginal anxiety, always gives rise to hysteria as well [as anxiety neurosis]; by far the majority of cases of intentional abstinence become linked from the beginning with true obsessional ideas; *coitus interruptus* [114]

in men never seems to me to be able to provoke a pure anxiety neurosis, but always a mixture of it with neurasthenia.

From these considerations it appears that we must further distinguish the aetiological conditions for the *onset* of the neuroses from their specific aetiological factors. The former – for example, *coitus interruptus*, masturbation or abstinence – are still ambiguous, and each of them can produce different neuroses. Only the aetiological factors which can be picked out in them, such as *inadequate disburdening* [*Entlastung*], *psychical insufficiency* or *defence accompanied by substitution*, have an unambiguous and specific relation to the aetiology of the individual major neuroses.[1]

As regards its intimate nature, anxiety neurosis presents the most interesting agreements with, and differences from, the other major neuroses, in particular neurasthenia and hysteria. It shares with neurasthenia one main characteristic – namely that the source of excitation, the precipitating cause of the disturbance, lies in the somatic field instead of the psychical one, as is the case in hysteria and obsessional neurosis. In other respects we rather find a kind of antithesis between the symptoms of anxiety neurosis and of neurasthenia, which might be brought out by such labels as 'accumulation of excitation' and 'impoverishment of excitation'. This antithesis does not prevent the two neuroses from being intermixed with each other; but it nevertheless shows itself in the fact that the most extreme forms of each are in both cases also the purest.

The symptomatology of hysteria and anxiety neurosis show many points in common, which have not yet been sufficiently considered. The appearance of symptoms either in a chronic form or in attacks, the paraesthesias, grouped like aurae, the hyperaesthesias and pressure points which are found in certain surrogates of an anxiety attack (in dyspnoea and heart attacks), the intensification, through conversion, of pains which perhaps have an organic justification – these and other features which the two illnesses have in common even allow of a suspicion that
[115] not a little of what is attributed to hysteria might with more justice be put to the account of anxiety neurosis. If one goes into the mechanism of the two neuroses, so far as it has been possible to discover it hitherto, aspects come to light which suggest that anxiety neurosis is actually the somatic counterpart to hysteria. In the latter just as in the former there is an accumulation of excitation (which is perhaps the basis for the

1 [The question of aetiology is discussed in greater detail in the following paper (1895*f*), p. 119 ff. below.]

similarity between their symptoms we have mentioned). In the latter just as in the former we find a *psychical insufficiency, as a consequence of which abnormal somatic processes arise*. In the latter just as in the former, too, instead of a psychical working over of the excitation, a deflection of it occurs into the somatic field; the difference is merely that in anxiety neurosis the excitation, in whose displacement the neurosis expresses itself, is purely somatic (somatic sexual excitation), whereas in hysteria it is psychical (provoked by conflict). Thus it is not to be wondered at that hysteria and anxiety neurosis regularly combine with each other, as is seen in 'virginal anxiety' or in 'sexual hysteria', and that hysteria simply borrows a number of its symptoms from anxiety neurosis, and so on. These intimate relations which anxiety neurosis has with hysteria provide a fresh argument, moreover, for insisting on the detachment of anxiety neurosis from neurasthenia; for if this detachment is not granted, we shall also be unable any longer to maintain the distinction which has been acquired with so much labour and which is so indispensable for the theory of the neuroses, between neurasthenia and hysteria.

Vienna, December, 1894

APPENDIX

THE TERM '*ANGST*' AND ITS ENGLISH TRANSLATION

[116] There are at least three passages in which Freud discusses the various shades of meaning expressed by the German word '*Angst*' and the cognates '*Furcht*' and '*Schreck*'.[1] Though he stresses the anticipatory element and absence of an object in '*Angst*', the distinctions he draws are not entirely convincing, and his actual usage is far from invariably obeying them. And this is scarcely surprising, since '*Angst*' is a word in common use in ordinary German speech and by no means exclusively a technical psychiatric term. It may on occasion be translated by any one of half a dozen similarly common English words – 'fear', 'fright', 'alarm' and so on – and it is therefore quite unpractical to fix on some single English term as its sole translation. Nevertheless, '*Angst*' does often appear as a psychiatric term (particularly in such combinations as '*Angstneurose*' or '*Angstanfall*') and for such occasions an English technical equivalent seems to be called for. The word universally, and perhaps unfortunately, adopted for the purpose has been 'anxiety' – unfortunately, since 'anxiety' too has a current everyday meaning, and one which has only a rather remote connection with any of the uses of the German '*Angst*'. There is, however, a well-established psychiatric, or at least medical, use of the English 'anxiety', going back (so the *Oxford Dictionary* tells us) to the middle of the seventeenth century. Indeed, the psychiatric use of the two words brings to light their parallel origins. '*Angst*' is akin to '*eng*', the German word for 'narrow', 'restricted'; 'anxiety' is derived from the Latin '*angere*', 'to throttle' or 'squeeze'; in both cases the reference is to the choking feelings which characterize severe forms of the psychological state in question. A still
[117] more acute condition is described in English by the word 'anguish', which has the same derivation; and it is to be remarked that Freud in his French papers uses the kindred word '*angoisse*' (as well as the synonymous '*anxiété*') to render the German '*Angst*'. (See above, p. 68.)

The English translator is thus driven to compromise: he must use 'anxiety' in technical or semi-technical connections, and must elsewhere choose whatever everyday English word seems most appropriate. Incidentally, the solution adopted in many of the earlier Freud translations of rendering '*Angst*' by 'morbid anxiety' seems especially ill-judged. One of the main theoretical problems discussed by Freud is precisely whether, and if so why, '*Angst*' is sometimes pathological and sometimes normal. (See, for instance, Addendum B to *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 146 ff.)[2]

1 See *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 12, *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 146, and a paragraph in Lecture XXV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 346.

2 Controversies surrounding the translation of '*Angst*' are discussed further in the translator's notes, ibid., **24**, 56–7.

Included (No. XXXIII) in Freud's own collection of abstracts of his early works (1897*b*). The present translation is a revised and corrected reprint of the *SE* version.

Freud's first paper on the anxiety neurosis having appeared in January, 1895, a criticism of it by Löwenfeld was published in the March issue of the *Neurologisches Zentralblatt*. The present paper is Freud's rejoinder. Leopold Löwenfeld (1847–1923) was a well-known psychiatrist practising in Munich. He was an acquaintance of Freud's and continued to be on friendly terms with him. He included chapters by Freud in two of his own books, he attended the first two Psychoanalytical Congresses, in 1908 and 1910, and even read a paper (on hypnotism) at the latter. In spite of this, however, he never fully accepted Freud's ideas. Freud's (1904*f*) review of one of Löwenfeld's books appears in *RSE*, **7**, 233 ff. A reference to the fact that the present controversy did not affect their good relations occurs in Lecture XVI of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 216 f.

The main importance of the present paper is the elaborate discussion in it of what Freud here calls 'the aetiological equation' – the interrelations between the different *sorts* of causes concerned in bringing about a neurosis (or, indeed, any other illness; [122] cf. the modern concept of 'epigenesis'). The question had already been sketched out

in a communication to Fliess on February 8, 1893 (Freud, 1950*a*, Draft B),[1] and was dealt with again later in the French paper on 'Heredity and the Aetiology of the Neuroses' (1896*a*). The 'aetiological equation', all the terms of which must be satisfied before a neurosis can become manifest, is alluded to again ten years later in the paper on sexuality in the neuroses (1906*a*), *RSE*, **7**, 288 f., and reappears in the Nuremberg Congress address (1910*d*), ibid., **11**, 136. But thereafter it gradually boils down into the interlocking between inheritance and experience – the two main sets of determinants of neurosis – and ends in the introduction of the concept of 'complemental series' in Lectures XXII and XXIII of the *Introductory Lectures* (1916–17*a*), ibid., **16**. There is a passage in the *Three Essays* in which the transition is clearly shown. In some sentences added to that work in 1915, Freud twice referred to an 'aetiological series', 'in which the diminishing intensity of one factor is balanced by the increasing intensity of the other'. Then in 1920, *after* writing the *Introductory Lectures*, he changed the phrase in the *Three Essays* to 'complemental series'; at least he changed *one* of its occurrences, but he overlooked the second. So that the two versions of the term are preserved within a few lines of each other (ibid., **7**, 212), and the line of descent from the aetiological equation to the complemental series is revealed.

1 The concept goes back still further; for, except in name, it appears in some of the very earliest of Freud's psychological writings that have survived, in one of his drafts ('III') for the 'Preliminary Communication' (1941*b* [1892]), *RSE*, **1**, 177 f., and in the even earlier letter to Breuer of June 29, 1892 (1941*a*), ibid., **1**, 175 f.

A REPLY TO CRITICISMS OF MY PAPER ON ANXIETY NEUROSIS

In the second number of Mendel's *Neurologisches Zentralblatt* for 1895, [123]
I published a short paper in which I ventured an attempt to detach a number of nervous states from neurasthenia and to establish them as an independent entity under the name of 'anxiety neurosis'.[1] I was led to do so by the presence of a constant conjunction of certain clinical features with certain aetiological ones – a thing which, in general, should permit us to make a separation of this kind. I found – and in this Hecker[2] (1893) had anticipated me – that the neurotic symptoms in question could all be classed together as constituting expressions of anxiety [*Angst*][T]; and, from my study of the aetiology of the neuroses, I was able to add that these portions of the complex of the 'anxiety neurosis' exhibit special aetiological preconditions which are almost the opposite of the aetiology of neurasthenia. My observations had shown me that in the aetiology of the neuroses (at all events of *acquired* cases and *acquirable* forms) sexual [*sexuelle*][T] factors play a predominant part and one which has been given *Geschlecht*
far too little weight; so that a statement such as that 'the aetiology of the neuroses lies in sexuality', with all its unavoidable incorrectness *per excessum et defectum* [in respect of exaggeration and omission], nevertheless comes nearer to the truth than do the other doctrines, which hold the field at the present time. A further assertion which my observations forced me to make was to the effect that the various sexual noxae are not to be found in the aetiology of every neurosis indifferently, but that unmistakable special relationships hold between particular noxae and particular neuroses. Thus I could assume that I had discovered the *specific* causes of the various neuroses. I then sought to formulate briefly the [124]
special character of the sexual noxae which constitute the aetiology of anxiety neurosis, and, on the basis of my view of the sexual process

1 'On the Grounds for Detaching a Particular Syndrome from Neurasthenia under the Description "Anxiety Neurosis"' (1895*b*) [p. 81 ff. above].

2 [Cf. p. 82 above. Freud had also mentioned Hecker's paper in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 229.]

(p. 96 f. above), I arrived at the proposition: anxiety neurosis is created by everything which keeps somatic sexual tension away from the psychical sphere, which interferes with its being worked over psychically. If we go back to the concrete circumstances in which this factor becomes operative, we are led to assert that [sexual] abstinence, whether voluntary or involuntary, sexual intercourse with incomplete satisfaction, *coitus interruptus*, deflection of psychical interest from sexuality, and similar things, are the specific aetiological factors of the states to which I have given the name of anxiety neurosis.

When I published the paper I have mentioned, I was under no illusion as to its power to carry conviction. In the first place, I was aware that the account I had given was only a brief and incomplete one and even in places hard to understand – just enough, perhaps, to arouse the reader's expectations. Then, too, I had scarcely brought forward any examples and given no figures. Nor had I touched on the technique of collecting anamneses or done anything to prevent misunderstandings. I had not given consideration to any but the most obvious objections; and, as regards the theory itself, I had laid stress only on its main proposition and not on its qualifications. Accordingly, each reader was in fact at liberty to form his own opinion as to the binding force of the whole hypothesis. I could, moreover, reckon upon another difficulty in the way of its acceptance. I know very well that in putting forward my 'sexual aetiology' of the neuroses, I have brought up nothing new, and that undercurrents in medical literature taking these facts into account have never been absent. I know, too, that official academic medicine has in fact also been aware of them. But it has acted as if it knew nothing about the matter. It has made no use of its knowledge and has drawn no inferences from it. Such behaviour must have a deep-seated cause, originating perhaps in a kind of reluctance to look squarely at sexual matters, or in a reaction against older attempts at an explanation, which are regarded as obsolete. At all events, one had to be prepared to meet with resistance in venturing upon
[125] an attempt to make something credible to other people which they could without any trouble have discovered for themselves.

In such circumstances it would perhaps be more expedient not to answer critical objections until I had myself expressed my views on this complicated subject in greater detail and had made them more intelligible. Nevertheless, I cannot resist the motives which prompt me to make an immediate answer to a criticism of my theory of anxiety neurosis which has appeared in recent days. I do so because its author, L. Löwenfeld of

Munich, the author of *Pathologie und Therapie der Neurasthenie*, is a man whose judgement undoubtedly carries great weight with the medical public; because of a mistaken view which Löwenfeld's account imputes to me; and finally because I wish to combat at the very start the impression that my theory can be refuted quite so easily by the first objections that come to hand.

With an unerring eye Löwenfeld (1895) detects the essential feature of my paper – namely, my assertion that anxiety symptoms have a specific and uniform aetiology of a sexual nature. If this cannot be established as a fact, then the main reason for detaching an independent anxiety neurosis from neurasthenia disappears as well. There remains, it is true, one difficulty to which I called attention [p. 102 f. above]: the fact that anxiety symptoms also have such very unmistakable connections with hysteria, so that a decision on Löwenfeld's lines would prejudice the separation between hysteria and neurasthenia. This difficulty, however, is met with a recourse to heredity as the common cause of all these neuroses (a view which I will go into later).

What arguments, then, does Löwenfeld use to support his objection to my theory?

(1) I emphasized as a point essential to an understanding of anxiety neurosis that the anxiety appearing in it does not admit of a psychical derivation – that is to say that the preparedness of anxiety, which constitutes the nucleus of the neurosis, cannot be acquired by a single or repeated affect of psychically justified fright. Fright, I maintained, might result in hysteria or a traumatic neurosis, but not in an anxiety neurosis. This denial, it is easy to see, is nothing else than the counterpart to my contention, on the positive side, that the anxiety appearing in my neurosis corresponds to a somatic sexual tension which has been deflected from the psychical field – a tension which would otherwise have made itself felt as libido. [126]

Against this, Löwenfeld insists on the fact that in a number of cases 'states of anxiety appear immediately or shortly after a psychical shock (fright alone, or accidents which were accompanied by fright), and in such situations there are sometimes circumstances which make the simultaneous operation of sexual noxae of the kind mentioned extremely improbable'. He gives, briefly, as a particularly pregnant example, one clinical observation (to serve instead of many). This example concerns a woman of thirty, with a hereditary taint, who had been married for four years and who had had a first, difficult, confinement a year before. A few

weeks after this event her husband had an attack of illness which frightened her, and in her agitation she ran about the cold room in her chemise. From that time on she was ill. First she had states of anxiety and palpitations in the evening, then came attacks of convulsive trembling, and after that phobias, and so on. It was the picture of a fully developed anxiety neurosis. 'Here,' concludes Löwenfeld, 'the anxiety states are obviously of psychical origin [*abgeleitet*], brought about by the single fright.'

I do not doubt that my respected critic can produce many similar cases. I myself can supply a long list of analogous examples. Anyone who has not seen such cases – and they are extremely common – of an outbreak of anxiety neurosis after a psychical shock ought not to regard himself as qualified to take part in discussions about anxiety neurosis. I will only remark in this connection that neither fright nor anxious expectation need always be found in the aetiology of such cases; any other emotion will do as well. If I hastily recall a few cases from my memory, I think of a man of forty-five who had his first attack of anxiety (with cardiac collapse) at the news of the death of his father, who was an old man; from that time on he developed a complete and typical anxiety neurosis with agoraphobia. Again, I think of a young man who was overtaken by the same neurosis on account of his agitation about the disagreements between his young wife and his mother and who had a fresh onset of agoraphobia after every domestic quarrel. Then, there was a student,
[127] something of an idler, who produced his first anxiety attacks during a period in which, under the spur of his father's displeasure, he was working hard for an examination. I recall, too, a woman, herself childless, who fell ill as a result of anxiety about the health of a small niece. And other similar instances. About the facts themselves, which Löwenfeld uses against me, there is not the slightest doubt.

But there *is* doubt about their interpretation [*Deutung*][T]. Are we to accept the *post hoc ergo propter hoc* conclusion straight away and spare ourselves any critical consideration of the raw material? There are examples enough in which the final, releasing cause has not, in the face of critical analysis, maintained its position as the *causa efficiens*. One has only to think, for instance, of the relationship between trauma and gout. The role of a trauma in provoking an attack of gout in the injured limb is probably no different from the role it plays in the aetiology of tabes and general paralysis of the insane; only in the case of gout it is clear to the meanest capacity that it is absurd to suppose that the trauma has 'caused' the gout instead of having merely provoked it. It is bound to make us thoughtful when we come across aetiological factors of this sort – 'stock'

factors, as I should like to call them[1] – in the aetiology of the most varied forms of illness. Emotion, fright, is also a stock factor of this kind. Fright can provoke chorea, apoplexy, paralysis agitans and many other things just as well as it can provoke anxiety neurosis. I must not go on to argue, of course, that, because of their ubiquity, the stock causes do not satisfy our requirements and that there must be specific causes as well; to do so would be to beg the question in favour of the proposition I want to prove. But I am justified in drawing the following conclusion: if the same specific cause can be shown to exist in the aetiology of all, or the great majority of, cases of anxiety neurosis, our view of the matter need not be shaken by the fact that the illness does not break out until one or other stock factor, such as emotion, has come into operation.

So it was with my cases of anxiety neurosis. Let us take the man who [p. 94 above], after receiving the news of his father's death, fell ill so inexplicably. (I add 'inexplicably' because the death was not unexpected and did not occur in unusual or shattering circumstances.) This man had carried out *coitus interruptus* for eleven years with his wife, whom he [128] tried for the most part to satisfy. Again, the young man who was not equal to the quarrels between his wife and his mother had practised withdrawal with his young wife from the first, in order to spare himself the burden of children. Then we have the student who acquired an anxiety neurosis from overwork, instead of the cerebral neurasthenia that was to be expected: he had maintained a relationship for three years with a girl whom it was not permissible for him to make pregnant. Again, there was the woman who, childless herself, was overtaken by an anxiety neurosis about a niece's illness: she was married to an impotent man and had never been sexually satisfied. And so on. Not all these cases are equally clear or equally good evidence for my thesis; but when I add them to the very considerable number of cases in which the aetiology shows nothing but the specific factor, they fit without contradiction into the theory I have put forward and they allow of an extension of our aetiological understanding beyond the boundaries hitherto in force.

If anyone wants to prove to me that in these remarks I have unduly neglected the significance of the stock aetiological factors, he must confront me with observations in which my specific factor is missing – that is, with cases in which anxiety neurosis has arisen after a psychical shock, although the subject has (on the whole) led *a normal vita sexualis*. Let us see now whether Löwenfeld's case fulfils this condition. My respected opponent has evidently not been clear about this necessity in his own

1 [See footnote 2, p. 89 above.]

mind, otherwise he would not have left us so completely in the dark about his patient's *vita sexualis*. I will leave on one side the fact that this case of a lady of thirty is obviously complicated by a hysteria as to the psychical origin of which I have not the least doubt; and I naturally admit without raising any objection the presence of an anxiety neurosis alongside of this hysteria. But before I turn a case to account for or against the theory of the sexual aetiology of the neuroses, I must first have studied the patient's sexual behaviour more closely than Löwenfeld has done here. I should not be content to conclude that, because the time at which the lady received her psychical shock was shortly after a confinement, *coitus interruptus* could not have played a part during the previous year, and that therefore sexual noxae are ruled out. I know cases of women
[129] who were made pregnant every year, and who yet had anxiety neurosis, because – incredible as it may seem – all sexual relations were stopped after the first fertilizing coition, so that in spite of having many children they suffered from sexual privation through all these years. No doctor is ignorant of the fact that women conceive from men whose potency is very slight and who are not able to give them satisfaction. Finally (and this is a consideration which should be taken into account precisely by the upholders of a hereditary aetiology), there are plenty of women who are afflicted with congenital anxiety neurosis – that is to say, who inherit, or who develop without any demonstrable disturbance from outside, a *vita sexualis* which is the same as the one usually acquired through *coitus interruptus* and similar noxae. In a number of these women we are able to discover a hysterical illness in their youth, since which their *vita sexualis* has been disturbed and a deflection of sexual tension from the psychical sphere has been established. Women with this kind of sexuality are incapable of obtaining real satisfaction even from normal coitus, and they develop anxiety neurosis either spontaneously or after further operative factors have supervened. Which of all these elements were present in Löwenfeld's case? I do not know. But I repeat: this case is evidence against me only if the lady who responded to a single fright with an anxiety neurosis had before then enjoyed a normal *vita sexualis*.

It is impossible to pursue an aetiological investigation based on anamneses if we accept those anamneses as the patients present them, or are content with what they are willing to volunteer. If syphilidologists still depended on the statements of their patients for tracing back an initial infection of the genitals to sexual intercourse, they would be able to attribute an imposing number of chancres in allegedly virginal persons to catching a chill; and gynaecologists would have little

difficulty in confirming the miracle of parthenogenesis among their unmarried lady clients. I hope that one day the idea will prevail that neuropathologists, too, in collecting the anamneses of major neuroses, may proceed upon aetiological prejudices of a similar kind.

(2) Löwenfeld says further that he has repeatedly seen anxiety states [130]
appear and disappear where a change in the subject's sexual life had certainly not taken place but where other factors were in play.

I, too, have made exactly the same observation, without, however, being misled by it. I myself have caused anxiety attacks to disappear by means of psychical treatment, improvement of the patient's general health, and so on; but I have naturally not concluded from this that what had caused the anxiety attack was a lack of treatment. Not that I should like to foist a conclusion of this sort upon Löwenfeld. My joking remark is only intended to show that the state of affairs may easily be complicated enough to render Löwenfeld's objection quite invalid. I have not found it difficult to reconcile the fact brought forward here with my assertion that anxiety neurosis has a specific aetiology. It will readily be granted that there are aetiological factors which, in order to exercise their effect, must operate with a certain intensity (or quantity)[1] and over a certain period of time – which, that is to say, become *summated*.[2] The effects of alcohol are a standard example of causation like this through summation. It follows that there must be a period of time in which the specific aetiology is at work but in which its effect is not yet manifest. During this time the subject is not ill as yet, but he is predisposed to a particular illness – in our case, to anxiety neurosis – and now the addition of a stock noxa will be able to set the neurosis off, just as would a further intensification of the operation of the specific noxa. The situation may also be expressed as follows: it is not enough for the specific noxa to be present; it must also reach a definite amount; and, in the process of reaching that limit, a quantity of specific noxa can be replaced by a quota of stock noxa. If the latter is removed once more, we find ourselves below a certain threshold and the clinical symptoms depart once more. The whole therapy of the neuroses rests upon the fact that the total load upon the nervous system, to which it has succumbed, can be brought below this threshold by influencing the aetiological mixture in a great variety of ways. From these circumstances we can draw no conclusion as [131]

1 [Cf. an Editors' footnote to the late paper on 'Female Sexuality' (1931*b*), *RSE*, **21**, 231 *n.*, and a passage in Chapter VII (E) of *The Interpretation of Dreams* (1900*a*), ibid., **5**, 538 f.; cf. also p. 60 above.]

2 [Cf. footnote, p. 95 above.]

to the existence or non-existence of a specific aetiology. These considerations are surely indisputable and assured. But anyone who does not think them sufficient may be influenced by the following argument. According to the views of Löwenfeld and very many others, the aetiology of anxiety states is to be found in heredity. Now heredity is certainly immune to alteration; thus if anxiety neurosis is curable by treatment, we should have to conclude according to Löwenfeld's argument that its aetiology *cannot* reside in heredity.

For the rest, I might have been spared having to defend myself against these two objections of Löwenfeld's, if my respected opponent had paid greater attention to my paper itself. In it, both these objections are anticipated and answered (p. 93 ff.). I have only been able to repeat here what I said there; and I have even purposely analysed the same cases over again. Moreover the aetiological formulas on which I have just laid weight are contained in the text of my paper [p. 95 above]. I will repeat them once more. I maintain that *there exists a specific aetiological factor for anxiety neurosis which can be replaced in its operation by stock noxae in a* QUANTITATIVE *sense, but not in a* QUALITATIVE *one*; I furthermore maintain that *this specific factor determines above all the* FORM *of the neurosis; whether a neurotic illness occurs at all depends on the total load upon the nervous system (in proportion to its capacity to carry the load)*. As a rule the neuroses are *overdetermined* [*überdeterminiert*][T];[1] that is to say, several factors operate together in their aetiology.

Überdeterminierung

(3) I need not concern myself so much about refuting Löwenfeld's next comments, since on the one hand they damage my theory very little and on the other they raise difficulties whose existence I acknowledge. Löwenfeld writes: 'The Freudian theory is totally insufficient to explain the appearance or non-appearance of anxiety attacks in individual instances. If anxiety states – i.e. the clinical symptoms of anxiety neurosis – occurred solely through a subcortical storing up of somatic sexual excitation and an abnormal employment of it, then every person who is afflicted with anxiety states ought, so long as no changes take place
[132] in his sexual life, to have an anxiety attack from time to time, just as an epileptic has his attack of *grand* and *petit mal*. But this, as everyday experience shows, is by no means so. The anxiety attacks happen in the great majority of instances only on definite occasions; if the patient avoids these occasions or is able to paralyse their influence by taking some precaution, he remains exempt from anxiety attacks, whether

1 [Freud had made this point in Section IV of *Studies on Hysteria* (1895*d*), *RSE*, **2**, 234.]

he is consistently given over to *coitus interruptus* or to abstinence, or whether he enjoys a normal sexual life.'

There is a great deal to be said about this. In the first place, Löwenfeld forces upon my theory an inference which it is not bound to accept. To suppose that in the storing up of somatic sexual excitation the same thing must be happening as in the accumulation of the stimulus which leads to an epileptic convulsion is to make a far too detailed hypothesis, and I have given no occasion for it; nor is it the only one that presents itself. I need only assume that the nervous system has the power to master a certain amount of somatic sexual excitation [*Sexualerregung*][T] even when the latter is deflected from its aim, and that disturbances only occur when that quantum of excitation receives a sudden increment, and Löwenfeld's claim would be disposed of. I have not ventured to extend my theory in that direction, chiefly because I did not expect to find any solid points of support along that path. I should merely like to indicate that we ought not to think of the *production* of sexual tension independently of its *distribution*; that in normal sexual life this production, when it is stimulated by a sexual object, takes on a substantially different form from what it does in a state of psychical quiescence; and so on. *Erregung*

It must be admitted that the condition of affairs here is in all probability different from what prevails in the tendency to epileptic convulsions, and that it cannot yet be consistently derived from the theory of the accumulation of somatic sexual excitation.

Against Löwenfeld's further assertion – that anxiety states only appear under certain conditions and fail to appear when those conditions are avoided, regardless of what the subject's *vita sexualis* may be – it must be pointed out that he clearly has in mind here only the anxiety of *phobias*, as, indeed, is shown by the examples attached to the passage I have quoted. He says nothing at all about the spontaneous anxiety attacks which take the form of vertigo, palpitation, dyspnoea, trembling, sweating, and so on. My theory, on the contrary, seems by no means unequal to explaining the emergence or non-emergence of these attacks of anxiety. For in a whole number of such cases of anxiety neurosis there does in fact appear to be a periodicity in the emergence of the states of anxiety, similar to what has been observed in epilepsy, except that in the latter the mechanism of the periodicity is more transparent. On closer examination we discover the presence, with great regularity, of an excitatory sexual process (that is, a process which is able to generate somatic sexual tension), and which, after the lapse of a definite and often constant interval of time, is followed by the anxiety attack. This [excitatory] role is [133]

played, in abstinent women, by menstrual excitation; it is played, too, by nocturnal pollutions, which also recur periodically. Above all, it is played by sexual intercourse itself (harmful from its being incomplete), which carries over its own periodicity to the effects it brings about, viz. to the anxiety attacks. If anxiety attacks occur which break through the usual periodicity, it is generally possible to trace them back to an incidental cause of rare and irregular occurrence – to a single sexual experience, something read or seen, and the like. The interval I have mentioned varies from a few hours to two days; it is the same as that which elapses in other people between the occurrence of the same causes and the onset of the well-known sexual migraine, which has well-established connections with the syndrome of anxiety neurosis.[1]

Besides this, there are plenty of cases in which a single anxiety state is provoked by the extra addition of a stock factor, by an excitement of some kind or other. The same holds good, therefore, for the aetiology of the individual anxiety attack as for the causation of the whole neurosis. It is not very strange that the anxiety of the phobias should obey different
[134] conditions; they have a more complicated structure than purely somatic anxiety attacks. In phobias the anxiety is linked to a definite ideational [*Vorstellungs*-][T] or perceptual content, and the arousal of this psychical content is the chief condition for the emergence of the anxiety. When this happens, anxiety is 'generated', just as for instance sexual tension is generated by the arousal of libidinal ideas. The connection of this process, however, with the theory of anxiety neurosis has not yet been elucidated.

I see no reason why I should try to hide the gaps and weaknesses in my theory. The main thing about the problem of the phobias seems to me to be that *when the vita sexualis is normal* – when the specific condition, a disturbance of sexual life in the sense of a deflection of the somatic from the psychical, is not fulfilled – *phobias do not appear at all*. However much else may be obscure about the mechanism of phobias, my theory can only be refuted when I have been shown phobias where sexual life is normal or even where there is a disturbance of it of a non-specific sort.

(4) I now pass on to a remark by my esteemed critic which I cannot leave uncontradicted. In my paper on anxiety neurosis I had written (p. 89):

1 [A paper on migraine, dealing with these connections, had been sent by Freud to Fliess, probably at about this time. See Freud, 1950*a*, Draft I; *RSE*, **1**, 241. This was never published by Freud. Cf. footnote, p. 95 above. See also Freud's (1895*j*) review of Moebius's *Migraine*, p. 137 ff. below.]

'In some cases of anxiety neurosis no aetiology at all is to be discovered. It is worth noting that in such cases there is seldom any difficulty in establishing evidence of a grave hereditary taint.

'But where there are grounds for regarding the neurosis as an *acquired* one, careful enquiry directed to that end reveals that a set of noxae and influences from *sexual life* . . . [are the operative aetiological factors].' Löwenfeld quotes this passage and adds the following gloss: 'From this it appears that Freud always regards a neurosis as "acquired" whenever incidental causes are to be found for it.'

If this meaning follows naturally from my text, then the latter gives a very distorted expression to my thoughts. Let me point out that in the preceding pages I have shown myself far stricter than Löwenfeld in my evaluation of incidental causes. If I were myself to elucidate the meaning of the passage I wrote I should add, after the subordinate clause 'But where there are grounds for regarding the neurosis as an *acquired* one . . .', the words '*because evidence (referred to in the previous sentence) of a hereditary taint is not forthcoming* . . .' What this means is that I hold the case to be an acquired one, since no heredity is to be discovered in it. In doing so I am behaving like everyone else, perhaps with the slight difference that others may declare the case to be determined by heredity even when there is no heredity, so that they overlook the whole category of acquired neuroses. But this difference runs in my favour. I admit, however, that I am myself to blame for this misunderstanding, on account of the way in which I expressed myself in the first sentence: 'no aetiology at all is to be discovered'. I shall certainly be taken to task from other directions as well and be told that I have created useless trouble for myself by searching for the specific causes of neuroses. Some will say that the true aetiology of anxiety neurosis, as of neuroses in general, is known: it is heredity. And two real causes cannot exist side by side. I have not, they will say, denied the aetiological role of heredity; but if so, all other aetiologies are merely incidental causes and equal to one another in value or want of value. [135]

I do not share this view of the role of heredity; and since in my short paper on anxiety neurosis it is precisely to this theme that I have paid least attention, I will now try to make good some of what I have omitted in it and to remove the impression that in writing my paper I had not attended to all the relevant problems.

I think we can arrive at a picture of the probably very complicated aetiological situation which prevails in the pathology of the neuroses if we postulate the following concepts:

(*a*) *Precondition*, (*b*) *Specific Cause*, (*c*) *Concurrent Causes*, and, as a term which is not equivalent to the foregoing ones, (*d*) *Precipitating or Releasing Cause*.

In order to meet every possibility, let us assume that the aetiological factors we are concerned with are capable of a quantitative change – that is of increase or decrease.

If we accept the idea of an aetiological equation of several terms which must be satisfied if the effect is to take place,[1] then we may characterize as the *precipitating* or releasing cause the one which makes its appear-
[136] ance last in the equation, so that it immediately precedes the emergence of the effect. It is this chronological factor alone which constitutes the essential nature of a precipitating cause. Any of the other causes, too, can in a particular case play the role of precipitating cause; and [the factor playing] this role can change within the same aetiological combination.

The factors which may be described as *preconditions* are those in whose absence the effect would never come about, but which are incapable of producing the effect by themselves alone, no matter in what amount they may be present. For the specific cause is still lacking.

The *specific cause* is the one which is never missing in any case in which the effect takes place, and which moreover suffices, if present in the required quantity or intensity, to achieve the effect, provided only that the preconditions are also fulfilled.

As *concurrent causes* we may regard such factors as are not necessarily present every time, nor able, whatever their amount, to produce the effect by themselves alone, but which operate alongside of the preconditions and the specific cause in satisfying the aetiological equation.

The distinctive character of the concurrent, or auxiliary, causes seems clear; but how do we distinguish between a precondition and a specific cause, since both are indispensable and yet neither suffices alone to act as a cause?

The following considerations seem to allow us to arrive at a decision. Among the '*necessary causes*' we find several which reappear in the aetiological equations concerned in many other effects and thus exhibit no special relationship to any one particular effect. One of these causes, however, stands out in contrast to the rest from the fact that it is found in no other aetiological equation, or in very few; and this one has a right to

1 [See Editors' Note, p. 107 f. above.]

be called the *specific* cause of the effect concerned. Furthermore, preconditions and specific causes are especially distinct from each other in those cases in which the preconditions have the characteristic of being long-standing states that are little susceptible to alteration, while the specific cause is a factor which has recently come into play.

I will try to give an example of this complete aetiological schematic picture:

Effect: Phthisis pulmonum. [137]

Precondition: Disposition, for the most part laid down through heredity, by the organic constitution.

Specific Cause: Bacillus Kochii.

Auxiliary Causes: Anything that diminishes the powers – emotions as well as suppurations or colds.

The schematic picture for the aetiology of anxiety neurosis seems to me to be on the same lines:

Precondition: Heredity.

Specific Cause: A sexual factor, in the sense of a deflection of sexual tension away from the psychical field.

Auxiliary Causes: Any stock noxae – emotion, fright, and also physical exhaustion through illness or over-exertion.

If I consider this aetiological formula for anxiety neurosis in detail, I am able to add the following remarks. Whether a special personal constitution (which need not be produced by heredity) is absolutely necessary for the production of an anxiety neurosis, or whether any normal person can be made to have an anxiety neurosis by some given quantitative increase of the specific factor – this I am not able to decide with certainty; but I incline strongly to the latter view. – Hereditary disposition is the most important precondition for anxiety neurosis; but it is not an *indispensable* one, since it is absent in a class of borderline cases. – The presence of the specific sexual factor can, in the majority of cases, be demonstrated with certainty. In one series of cases (congenital ones) this factor is not separated from the precondition of heredity, but is fulfilled with the help of it. That is to say, in some patients this peculiarity of the *vita sexualis* – psychical inadequacy in mastering somatic sexual tension – is innate in the form of a stigma[1] whereas ordinarily it is via that peculiarity that they acquire the neurosis. In another class of borderline cases the specific cause is contained in a contributory one. This is when the psychical inadequacy which I have just mentioned is brought about by exhaustion and such causes. All these cases fall into classes which melt

1 [See footnote 2, p. 200 below.]

into one another and do not form separate categories. In all of them, moreover, we find that the sexual tension undergoes the same vicissi-
[138] tudes; and for most of them the distinction between precondition, specific and auxiliary cause holds good, in conformity with the solution to the aetiological equation which I have given above.

When I consult my experience on this point, I cannot find that there is any antithetic relation as regards anxiety neurosis between hereditary disposition and the specific sexual factor. On the contrary, the two aetiological factors support and supplement each other. The sexual factor is usually only operative in those who have an innate hereditary taint as well; heredity alone is usually not able to produce an anxiety neurosis, but waits for the occurrence of a sufficient amount of the specific sexual noxa. The discovery of the hereditary element does not, therefore, exempt us from searching for a specific factor. On its discovery, incidentally, all our therapeutic interest as well depends. For what can we do therapeutically about heredity as an aetiological element? It has always been there in the patient and will continue to be there until the end of his life. Taken by itself, it cannot help us to understand either the episodic onset of a neurosis or the cessation of a neurosis as a result of treatment. It is nothing but a *precondition* of the neurosis – an inexpressibly important precondition, it is true, but nevertheless one which has been overestimated, to the detriment of therapy and theoretical comprehension. To be convinced by the contrasting state of affairs, one has only to think of the cases of nervous diseases that run in families (such as chorea chronica, Thomsen's disease, and so on), in which heredity unites in itself all the aetiological preconditions.

In conclusion, I should like to repeat the few statements in which I am accustomed, as a first approximation to the truth, to express the mutual relationships between the various aetiological factors:

(1) Whether a neurotic illness *occurs at all* depends upon a quantitative factor – upon the total load on the nervous system as compared with the latter's capacity for resistance [*Resistenzfähigkeit*]. Everything which can keep this quantitative factor below a certain threshold value, or can bring it back to that level, has a therapeutic effect, since by so doing it keeps the aetiological equation unsatisfied.

What is to be understood by the 'total load' and by the 'capacity for
[139] resistance' of the nervous system could no doubt be more clearly explained on the basis of certain hypotheses regarding nervous function.[1]

1 [This is no doubt an allusion to the 'principle of constancy'. See above, p. 59.]

(2) What *dimensions* the neurosis attains depends in the first instance on the amount of the hereditary taint. Heredity acts like a multiplier introduced into an electric circuit, which increases the deviation of the needle many times over.[1]

(3) But what *form* the neurosis assumes – what direction the deviation takes – is solely determined by the specific aetiological factor arising from sexual life.

Although I am aware of the many still unsolved difficulties of the subject, I hope that, on the whole, my hypothesis of an anxiety neurosis will prove more fruitful for an understanding of the neuroses than Löwenfeld's attempt to account for the same facts by postulating '*a combination of neurasthenic and hysterical symptoms in the form of an attack*'.

Vienna, beginning of May, 1895

1 [This analogy is found already in Draft A in the Fliess papers (1950*a*), which possibly dates from the end of 1892; *RSE*, **1**, 205. It occurs again in the French paper on 'Heredity and the Aetiology of the Neuroses' (1896*a*), p. 157 below, as well as in Freud's abstract of the present paper, p. 250 below.]

MECHANISM OF OBSESSIONAL IDEAS AND PHOBIAS

(1895)

EDITORS' NOTE

MECHANISMUS DER ZWANGSVORSTELLUNGEN UND PHOBIEN

GERMAN EDITIONS

1895 *Wien. klin. Wschr.*, **8** (27), 496. (July 4.)
1987 *GW*, **Nachtr.**, 354–7; Extract from the discussion: *GW*, **Nachtr.**, 357–9.

ENGLISH TRANSLATION

'Mechanism of Obsessional Ideas and Phobias'
1989 *Int. J. Psycho-Anal.*, **70** (1), 91–3. (Tr. Mark Solms.)

The present translation is a slightly modified and corrected version of the one published in 1989.

This report (by Freud's own hand) was discovered by Ola Andersson while he was researching his work on the prehistory of psychoanalysis (Andersson, 1962).

Freud gave the lecture to the Verein für Psychiatrie und Neurologie (Society for Psychiatry and Neurology) on January 15, 1895. The discussion was adjourned until June 11 and was published in part 43 of the same volume of the *Wien. klin. Wschr.* (**8**, 762).

The lecture presents us with an interesting condensation of two contemporaneous published papers: the French 'Obsessions et phobies' (1895*c*) – which, although written in 1894, actually appeared in print a fortnight after the present lecture, on January 30, in the *Revue neurologique* – and the first paper on anxiety neurosis (1895*b*), which was published on the day that this lecture was presented: January 15 (but is dated December, 1894, and was written after the French paper, as is shown by reference back to the latter).

The first part of the lecture covered in the main the same ground as 'Obsessions et phobies', the earlier part of which was itself little more than a repetition of Section II of Freud's first paper on the 'Neuropsychoses of Defence' (1894*a*), dealing with obsessional ideas. Phobias, which are also touched on in that paper, are dealt with more fully in 'Obsessions et phobies' (pp. 73–4 above). It is clear from the present report, however, that the account of phobias given in the second part followed much more closely that in Section I (7) of the first paper on anxiety neurosis (1895*b*). (Cf. pp. 86–7 above.)

MECHANISM OF OBSESSIONAL IDEAS AND PHOBIAS

He [Freud][I] referred briefly to the prevailing conception [*Auffassung*][T] of obsessional ideas, according to which they are reputed to be purely formal disturbances in the realm of ideas, the intensity of which is attributed not to psychological motives, but to physiological causes.[2] He then proposed to arrange the relevant cases into three groups: (1) *traumatic obsessional ideas*, (2) true obsessional ideas or *obsessions*,[3] (3) true *phobias*. The cases in the first group are to be set apart; they have the closest correspondence with hysterical symptoms and are to be described as unaltered mnemic residues. Pascal's affliction would perhaps be a historical example of a traumatic obsessional idea: he never lost the fear of having an abyss on his left-hand side after narrowly escaping the peril of being flung from his coach into the Seine, which flowed below on his left.[4]

The speaker said of true obsessional ideas that they consist in a combination of a powerful affective state with an ideational component [*Vorstellungsinhalt*][T] which varies in such a way that the major emphasis clearly falls upon the affect. The affect is always of a disagreeable nature

Vorstellung

1 [The report is introduced by the words: 'Dr Sigmund Freud delivered a lecture on the "Mechanism of Obsessional Ideas and Phobias".']

2 [This apparently refers to Krafft-Ebing's (1879–80) views. See *RSE*, **24**, 77, for a discussion of 'motives' versus 'causes'.]

3 ['*Zwangsvorstellung*' is usually translated as 'obsession' in the *RSE*, although Strachey recognized that the German term literally means 'compulsive idea' or 'obsessional idea'. In support of his rendition of the term, Strachey (p. 66 above) argues that Freud (1895*c*) himself translated '*Zwangsvorstellung*' by the French '*obsession*', and that there was no German equivalent for the French (and English) word until Krafft-Ebing introduced '*Zwangsvorstellung*' in 1867. However, in the present report, Freud uses two different German terms: '*Zwangsvorstellungen*' and '*Obsessionen*'. The English 'obsessions' must obviously be reserved for the latter term, so *Zwangsvorstellungen* is here rendered as 'obsessional ideas'. (See *RSE*, **24**, 98–9.)]

4 [This event is alleged to have occurred in 1660 on the Neuilly bridge, but the authenticity of the anecdote – propagated by Voltaire – has often been questioned. Elsewhere (1895*c*, p. 67 above) Freud wrote that Pascal *thought he saw* an abyss on his left, and in a meeting of the Vienna Psychoanalytical Society (December 22, 1909) he is reported to have remarked that, according to Charcot, Pascal had the *sensation* of passing along the edge of an abyss (*Minutes*, **2**, 369). Moreover, there he described the symptom as a phobia. Freud's first (1895*c*) version of the anecdote comes closest to Voltaire's account (1741, 181; 1767, 156).]

and the idea does not really suit the affect, so that the combination makes an absurd impression on the patient. Nevertheless, the patient is powerless to fend off [*erwehren*] the idea. The compulsion [*Zwang*] which produces the idea is explained as follows. The distressing affect is *always completely justified*, e.g. someone who suffers from obsessional reproachfulness [*Zwangsvorwürfen*] indeed has good reason to reproach himself, but the idea linked to the affect is not the correct one which was originally tied to the affect, but rather a *surrogate*, a *substitute* for it.

Verdrängung

Therefore the original *repressed* [*verdrängte*][T] idea can always be established, and it displays the following attributes: it derives from the sexual life of the patient, it is of a distressing nature, and it is excellently suited to the affect preserved in the obsessional idea. The reinstatement of the repressed idea in the [affect–idea] relations that existed before the appearance of the obsessional idea is frequently also a therapeutic achievement, which puts an end to the obsessional idea, or at least gives an indication of what therapy is required.

The speaker attempted to prove this proposition by reporting more than twelve cases of obsessional ideas in which he was able to establish the aetiology, and reinstate the repressed idea.[1] He said nothing about the technique which leads to the discovery of the repressed idea. He then attempted to answer three questions which follow from the case reports: (1) How is it possible to institute such a *substitution* (of the repressed idea by the obsessional idea)? (2) To what purpose does this occur? (3) How does it happen that the substituted idea is maintained indefinitely? – The answer to the first question is that the capacity for substitution is evidently a special psychical disposition, because *similar heredity*[2] can so often be demonstrated with obsessional ideas – and in the speaker's small collection of cases, too. In replying to the second question, the speaker asserted that substitution probably serves the purpose of *defence* [*Abwehr*][T] against an idea which is incompatible[3] with the ego [*Ich*][T]. (Cf. the speaker's paper on the 'Neuropsychoses of Defence' in the *Neurologisches Zentralblatt*, 1894*a*, p. 43 ff. above.) Finally, the problem of the persistence of the obsessional idea coincides with the problem of the persistence of hysterical symptoms, and the attempted

1 [These cases are described in detail in the French paper (1895*c* [1894]), p. 68 ff. above.]

2 [Cf. the discussion of similar and dissimilar heredity on pp. 154–5 below.]

3 ['*unverträglichen*.' See Strachey's remarks on the translation of this term on p. 66 above.]

explanation offered for the latter by J. Breuer and the speaker also applies to the case of obsessional ideas.[1]

The speaker said of phobias that they are distinguishable from obsessions in that the affect concerned [in phobias] is monotonous – always that of *anxiety* – and further, in terms of their typical symptoms [i.e. their stereotypy], in comparison to the specialization of obsessions.

The phobias can be divided into two groups, according to their content: (1) *Common phobias*, or fear of things that also normally evoke a certain amount of anxiety – such as thunderstorms, darkness, snakes, dangers [in general], illnesses, etc. (The old term 'hypochondria' can be reserved for excessive fear of illnesses.) In the moral sphere, the anxiety manifests itself as pangs of conscience, doubt and pedantry. (2) *Locomotive phobias*,[2] of which agoraphobia is an example. These lack the obsessive character [of 'common' phobias].[3]

The psychical mechanism of phobias is, however, entirely different from that of obsessions. Upon psychological analysis, one finds no substitution here, no repressed idea. Instead, as the foundation of phobias one only comes across a tendency to anxiety, which is psychically irreducible, and is also not influenced by therapy. It thus becomes a question of providing information for the patient on the source of this tendency to anxiety. According to the speaker's conception, it [the tendency to anxiety] does not have a psychical origin, but rather represents the chief symptom of a neurosis that deserves to be differentiated from neurasthenia and to carry the name '*anxiety neurosis*', because its combined symptoms can be conceived of as parts of the 'anxiety' complex.[4] Phobias therefore belong to the anxiety neuroses, which have hitherto been confused with neurasthenia, and they are regularly accompanied by other symptoms of these neuroses.

The speaker went on to say that the combination of obsession and phobia is a frequent occurrence, in the sense that an initial (hypochondriacal or other) phobia materializes as the basis of an 'anxious

1 [This is an allusion to Breuer & Freud, 'On the Psychical Mechanism of Hysterical Phenomena: Preliminary Communication' (1893*a*), *RSE*, **2**, 3 – a reference which Freud gives in the corresponding place in his French paper (1895*c*), p. 72 above.]

2 [In the French paper (1895*c*, p. 73 above) Freud proposed a different terminology. There he divided the phobias into 'common' and 'contingent' groups, and agoraphobia and 'the other phobias of locomotion' were cited as examples of contingent phobias. However, the present terminology is consistent with what Freud proposed in his 'Anxiety Neurosis' paper (1895*b*, p. 86 f. above).]

3 ['*Dieser fehle der obsedierende Charakter*', i.e. the symptoms of a 'locomotive' phobia are contingent upon special conditions. Cf. Freud (1895*c*), p. 73 above.]

4 Cf. the speaker's paper on anxiety neurosis in the *Neurologisches Zentralblatt*. [Freud (1895*b*), p. 81 ff. above.]

expectation' and that the ideational content of the phobia undergoes substitution. As a rule, the distressing idea of the phobia is substituted by the '*protective procedure*', which was originally instituted as a defence against the phobia. Thus, for example, cases of obsessional brooding [*Grübelsucht*] arise in the following way. Originally there is a hypochondriacal anxiety idea with the following content: '[I am going] to go mad'. To prove to himself that he is not yet mad, the person in question becomes accustomed to reflecting upon self-imposed problems. This starts out as a comforting activity, but it later draws the anxiety of the phobia on to itself.[1] The best-known forms, described as *folie du doute*, onomatomania, etc., can be viewed in just this light.

1 [Cf. Case 7 cited on pp. 70 f. and 74 above.]

REVIEW OF MOEBIUS'S *MIGRAINE*

(1895)

EDITORS' NOTE

REVIEW OF MOEBIUS'S *MIGRAINE*

GERMAN EDITIONS

1895 *Wien. klin. Rdsch.*, **9** (9), 140–1. (March 3.)
1983 *Psyche*, **37** (9), 818–20. (September.)
1987 *GW*, **Nachtr.**, 364–9.

The present translation, by Mark Solms, is the first into English. It is also included in *NSW*, **4**.

This article, discovered by Jeffrey Masson – and reprinted together with an informative commentary by Oswald Kästle (1983) – appeared in the 'Critical Reviews and Literary Notes' section of the *Rundschau*, which gave the following details of the booklet under review: '*Migräne* by G. [sic] J. Moebius. From Volume XII of *Specielle Pathologie und Therapie*, edited by H. Nothnagel. Vienna: Verlag Alfred Holder, 1894.)' A second edition of Moebius's book was published in 1903.

The twenty-four volumes of Hermann Nothnagel's great *Handbuch* appeared from 1894 to 1908 in random order. Freud himself later contributed *Die infantile Cerebrallähmung* (1897*a*; *NSW*, **3**) to the series.

Paul Julius August Moebius (1853–1907), from Leipzig, studied theology and philosophy before turning to medicine and specializing in neurology. He was an Assistent at the University Poliklinik and subsequently became head of the Albert-Verein Nervenpoliklinik in Leipzig. Disappointed by lack of promotion, he retired from hospital life in 1893, and, with some private practice, devoted himself to writing. He was an able and very prolific author with wide-ranging interests. His publications included such subjects as neurology and neuroanatomy, functional nervous disorders, aspects of sexual difference and, later, a series of pathographical studies of Rousseau, Goethe, Schopenhauer and Nietzsche.

His writings on hysteria were of particular interest to Freud and Breuer, several of his papers receiving detailed discussion in Breuer's theoretical chapter in *Studies on Hysteria*. (Cf. *RSE*, **2**, 166–8, 170, 191–2, 221 *n*. 1 and 222.) Especially valuable is Freud's later (1907) review of Moebius's *The Hopelessness of All Psychology*, which was published posthumously (*Minutes*, **1**, 119 ff.).

Some light is thrown on the background to this review by the Fliess correspondence. Thus, in a letter to Fliess dated August 29, 1894, Freud writes: 'A monograph by

Moebius has appeared, called *Neurologische Beiträge* [1894*b*]. It is a collection of previously published little essays, very well done; they are important on the subject of hysteria. His is the best mind among the neurologists; fortunately he is not on the track of sexuality . . . When I get back to Vienna my editor will certainly be after me for articles. Might I not offer him a critical article on M's "Migraine"? You would have to let me have some of your observations.' (Freud, 1950*a*, Letter 21.) (The editor referred to is no doubt Heinrich Paschkis (1849–1923), editor of the *Wiener klinische Rundschau*, to which Freud contributed regularly.) In a further letter, dated March 4, 1895, Freud remarks: 'Perhaps the short paper on migraine will come into your hands. It contains only two leading ideas . . .' (ibid., Letter 22). These 'two leading ideas' may well correspond to the 'two points' in the review that Freud wishes to emphasize 'as a supplement to Moebius's exposition', i.e. the hemicranial equivalents to migraine (p. 138 below) and the connection with the nose, where the theories of Fliess are introduced. (See the final paragraph of the review, p. 140 f.)

Draft I, on migraine, in the Freud/Fliess correspondence, *RSE*, **1**, 241 ff., was assigned tentatively to Spring, 1895, in the 1950 edition for a reason that no longer appears valid. The unabridged edition of the correspondence gives its date of origin as Autumn, 1895. In any case, the characteristic emphasis in Draft I on the factor of 'summation' suggests a link with Freud's two papers on anxiety neurosis (1895*b* and 1895*f*), pp. 95 and 117 f. above. Additional remarks along these lines can be found in his January, 1896 revision of the 'Project' (see *RSE*, **1**, 413 ff.).

Migraine was a subject of particular interest to Freud and Fliess, not least because both of them suffered from it (see Schur, 1972, 96–100). That Freud did, in fact, take some of Fliess's observations into consideration is evident from the final paragraph of the present review.

REVIEW OF MOEBIUS'S *MIGRAINE*

Moebius has inaugurated the forthcoming series of neurological contributions to Nothnagel's great handbook of internal medicine with a seven-page booklet on migraine that ought to arouse interest and find recognition beyond the circle of the neurologist. The works of Moebius are of the sort that give an impression of the personality of their author and, simultaneously, are inseparable from this personality in the imagination of the reader. Thus the present text, again, embodies all the qualities which one has learnt to value in Moebius: the courage to trust his own observations, the critical inclination [*kritische Lust*] to demolish illusions, and the logical consistency of the thinker who, in controversy, does not avoid going back to the ultimate grounds for knowledge and for doubt. In addition to these characteristics, the presentation of our author lays bare with ruthless honesty all the gaps and inconsistencies in an area of knowledge. He takes care, furthermore, both in the interpretation [*Auffassung*][T] of the symptoms and in the evaluation of therapy, to give the psychical factor – recently having achieved influence in medicine – its due.

The booklet is not merely instructive, it is also gripping from beginning to end. It is written in a correct and elegant style, while so very many medical authors forget that specialist education does not provide general education [*Bildung*][T], and does not rescind the demands which a nation might place upon those who would write in its language. The booklet couches critical propositions and concepts of far-reaching significance in the most pleasing and impressive terms. I quote a few sentences – in which Moebius sets out his opinion on the 'vasomotor theory' of migraine (p. 105):[1] 'I am of the conviction that the vasomotor theory is dead, that it is only still taught by dint of *vis inertiae* [force of inertia]. Accordingly, I lack the heart to enter into a detailed contestation of the

1 [The view of migraine as a vasomotor disorder – a theory that is not wholly 'dead' even today – is based on the hypothesis that the headache is due to cerebral vascular dilatation following a preliminary constriction.]

deceased. Only the most important points need be briefly emphasized. Everywhere – in the physiological field as in the pathological – the processes in the parenchymal cells are primary, the changes in local circulation are consequences. The parenchyma is the master, the circulation the servant.'

It would be tempting to pursue the rich content of this book in detail, but I decline to do so here because I wish to offer neither a summary nor a collection of small excerpts. I might therefore be permitted, as a supplement to Moebius's exposition as it were, to deal in depth with two points[1] which I think must occupy more space in any future exegesis of migraine. Firstly, I would like to direct attention to '*hemicranial equivalents*'.[2] These are clinical states that are composed of symptoms different from migraine but which in terms of their onset and course, and especially on account of their interchangeability with migraine, must be identified with it.[3] It is clear that these migraine equivalents possess a high degree of diagnostic and theoretical interest. Moebius does not neglect to mention these states either, complaining as he does that we still know very little about them.

From personal experience, I know of three forms of migraine equivalent, which any reader can surely corroborate: gastric, spinal and cardiac migraine. Gastric migraine is actually a rudimentary form of cranial migraine wherein the gastric phenomena alone have remained. I am reminded of the patient in whom I first diagnosed this condition: a young lady whose 'gastric complaints' are still today not recognized as migraine by her physician. The gastric complaints consist in attacks of nausea which typically end in vomiting, and which last for up to twenty-four hours. They started shortly after puberty. Infrequent at first, they now occur more frequently, usually at intervals of several weeks. Faint pressure in the forehead and pronounced sensitivity to light and noise, which persist throughout the attack, permit the identification of this nervous complaint as migraine.

It is evident that there is nothing about gastric migraine that would extend the scope of the migraine concept. However, this [extension] does occur with 'spinal migraine', a condition which – remarkably – I

1 [See Freud's letter to Fliess of March 4, 1895, quoted on p. 136 above.]

2 [The term 'hemicrania' – unilateral headache – was introduced by Galen in the second century A.D., and 'migraine' is derived from it via the French '*mi-crâne*'.]

3 [Freud makes some very similar remarks in *Studies on Hysteria* (1895*d*), *RSE*, **2**, when discussing certain symptoms of Frau Emmy von N. A long footnote (ibid., **2**, 63), clearly added as an afterthought, very likely dates from the same period as the present review. See also his remark on ibid., **2**, 84.]

first came to know in the sister of the patient just referred to. This lady had suffered through her entire youth, up to a definite period, from common migraine – not too severe. A change set in when she developed a severe neurosis of mixed character (hystero-neurasthenia).[1] From then onwards, she suffered from attacks of back pain which raged in the spinal column and gripped the body in rings. There was (also periodic) hysterical spinal analgesia. The interpretation [*Deutung*][T] of migraine came from the patient herself, who described this pain and the other as being absolutely identical. She suffered, she said, from 'migraine in the back'. She sometimes suffered *états du mal*, confluent attacks. Over many years of observation, I have learnt not to interpret backache such as this as organic illness. As the neurosis improved, the cranial migraine returned. In the past two years, in reasonable health, the lady has experienced oscillations between her old and her modified migraine attacks, which, incidentally, now both occur only occasionally. The spinal migraine and the other form [common migraine] have the same cause, but it generally lasts somewhat longer. *Coitus interruptus*, which also plays its role in the genesis of the neurosis, is the only indubitable cause. Gastric symptoms were barely present in this case. I have subsequently encountered spinal migraine repeatedly – most recently in a girl who was relieved by me of her obsessional ideas [*Zwangsvorstellungen*][T] during a nutritional treatment.[2] This patient had long suffered from common migraine, the manifestations of which included attacks of nausea as well as pains in the neck and shoulder. In the context of a deterioration in her [general] condition – brought on by obsessional ideas – she complained about a sharp pain along the entire spine during her migraine attacks, compared to the severity of which the headaches receded into the background. In the course of the nutritional treatment, I witnessed an attack in which headache and backache had an equal share, and two further attacks, divided by a four-week interval, which were again purely cranial migraines. It is evident that the spinal migraine had not altogether detached itself from the 'cranial migraine' in this case. Here too, incidentally, as in the last-mentioned case, the spinal migraine coincided with a phase of [general] deterioration, and it receded as the general condition improved. Furthermore, in both cases

Zwang

1 [Cf. the case of 'Nina R.', to whom this diagnosis might well have suitably been applied (*RSE*, **2**, 277 ff.).]

2 [For a description of Weir Mitchell's 'rest cure' (also called Playfair's treatment), see Freud (1887*b* and 1888*b*), ibid., **1**, 36 f. and 57 f.]

there was a very prominent spinal neurasthenia[1] which was all but cured by the treatment.

I know of only a few examples of the third form of migraine equivalent: cardiac migraine. I think, however, that others must come across it more frequently. As a typical instance, I describe the case of a colleague, approximately fifty years old, who suffered from common migraine in his youth. This physician, who – judging by his general performance – has a sufficient heart, periodically suffers from slightly painful attacks of arrhythmia in situations of the sort that usually give rise to [common] migraine. These attacks last for three to six hours and are accompanied by slight pressure in both temples. The situational triggers are a disturbed night's rest, aggravation or serious professional worry. The frequency of the attacks varies from twice a week to once in three weeks. I consider these attacks to be hemicranial equivalents, but will readily admit that there is a deficiency of other connecting links in the series from such attacks to common hemicraniae. In general, I do not think that these supplements to common and ocular migraine exhaust the diversity of the forms taken by migraine.

I would like to emphasize a further relationship displayed by migraine, one about which Moebius also did not express disapproval: the relationship of this condition to the *nose* – I deliberately do not say *to the diseases of the nose*. I have two reasons – only subjective reasons, for now – to lend my support to this [theoretical relationship]: firstly, the experience that I have obtained in my own case,[2] which demonstrates that frequent and severe migraine can be transformed into infrequent and mild migraine by treatment of the hypertrophic erectile tissue [of the nose];[3] and secondly, the close acquaintance I have with the works and unexpected therapeutic results of a researcher well known to readers of this journal, Dr W. Fliess[4] of Berlin. According to Fliess (who is

1 [Alongside the generalized neurasthenia (nervous weakness), various special forms were distinguished at this period, the most important of which were cerebral, spinal and visceral neurasthenia. Another noteworthy form was sexual neurasthenia, which, in prolonged and serious cases, could develop into spinal neurasthenia. Spinal neurasthenia was considered to be the result of physical over-exertion, serious disease, the puerperal state, sexual excess or emotional excitement. See Krafft-Ebing (1879–90, Part III, Chapter 1) for a general discussion of the subject. See also the description of symptoms and search for a diagnosis in the case of 'Nina R.' (*RSE*, **2**, 277 ff.).]

2 ['*am eigenen Leib*', literally 'on my own body'.]

3 [I.e. the *corpus cavernosum conchae*. – Fliess treated Freud for nasal troubles, which were supposedly at the root of his migraine and cardiac symptoms. Cf. Chapters 2 and 3 in Schur (1972).]

4 [Fliess's paper, 'Magenschmerz und Dysmenorrhoe in neuem Zusammenhang' (1895), was published in the *Wiener klinische Rundschau* in a series that was still continuing at the time of Freud's present review.]

ahead of his predecessor Hack[1] in that he uses cocaine as a diagnostic aid, practises bold modern therapeutic techniques, and holds views of general significance), the nose is to be granted a role in the pathogenesis of headaches in general as well as in migraine – not only in exceptional cases, but rather as a rule.[2] If this link could be confirmed, we would be in a position to understand much better than we do today the relationship of 'symptomatic migraine attacks' to the 'disease of migraine' (p. 69). It would then also be easy to formulate objections against the unappealing definition of migraine offered by Moebius, who views this extremely common and readily acquired malady as a '*form of inherited degeneracy*'.

1 [Wilhelm August Heinrich Hack (1851–87), an otolaryngologist from Freiburg, is credited with having developed the concept of the nasal reflex neurosis independently of Fliess.]

REVIEW OF HEGAR'S *THE SEXUAL DRIVE: A SOCIO-MEDICAL STUDY* (1895)

EDITORS' NOTE

REVIEW OF HEGAR'S *DER GESCHLECHTSTRIEB*

GERMAN EDITIONS

1895 *Wien. klin. Rdsch.*, **9** (5), 77. (February 3.)
1983 *Psyche*, **37**, 811.
1987 *GW*, **Nachtr.**, 489–90.

ENGLISH TRANSLATION

1990 *Int. Rev. Psychoanal.*, **17** (3), 361–2. (Tr. Mark Solms.)

The present translation is a slightly revised version of the one published in 1990.

Freud was a frequent contributor of reviews and papers to the *Wiener klinische Rundschau*. This review was discovered by the late Oswald Kästle, and reprinted by him in 1983. It concerns a book, *Der Geschlechtstrieb. Eine social-medicinische Studie* (Stuttgart, 1894, 160 pp.), by Alfred Hegar (1830–1914), at first a practising doctor in Darmstadt and then Professor of Obstetrics and Gynaecology at the University of Freiburg, and an important pioneer of surgical gynaecology.

Hegar's book was designed to counter, on 'scientific' grounds, August Bebel's influential Marxist-feminist treatise *Die Frau und der Sozialismus* (1883). Bebel, in turn, offered a spirited rejoinder to Hegar in his preface to the 25th (1895) edition of his book. Freud's laconically critical appraisal of Hegar's efforts is of historical interest in that it contains an early published statement of his views on the uncomfortable tension that exists between sexuality and civilization.

REVIEW OF HEGAR'S *THE SEXUAL DRIVE: A SOCIO-MEDICAL STUDY*

This small text [160 pages] by the famous gynaecologist will disappoint many, who – misled by the title – would expect authentic disclosures from an expert on the sexual life of women. It takes the form of a rebuttal of Bebel's well-known book, *Die Frau und der Sozialismus* [1883];[1] a rebuttal, however, which neither in content nor in style is capable of successfully contesting the influence which the rival point of view has had on readers. Incidentally, Hegar's book is just as tendentious as is that of the socialist leader [Bebel]. While the latter emphasizes as much as possible the demands of the sexual drive [*Geschlechtstriebes*][2] which are not sanctioned by the current social order, the physician [Hegar] is at pains to portray the disagreeable agitator [sexuality] as a relatively harmless fellow. One cannot avoid the suspicion – according to Hegar – that the sexual drive in contemporary civilized [*zivilisierten*][T] man is, after all, not as excessively strong as it is made out to be. In men, one should distinguish 'between natural predisposition and artificially kindled flame' (p. 5), while 'the natural inclination of women to physical love in general, disregarding exceptions of course, is not very strong'. *Kultur*

As is to be expected, Hegar occasionally has to acknowledge facts which fit badly with his lowly estimation of the sexual drive. Thus he states in the discussion of 'free love': 'One should scarcely think it possible nowadays, when the dangers which free love brings with it have been so well established, that anyone would expose themselves to them' (p. 51). Hegar finds an explanation [for the fact that people nevertheless do so] in the observation that the vast majority of people still have no clear idea of the harmfulness of free love. In the copy of Hegar's book which I acquired, there is a marginal gloss to this: 'Herr Hegar simply

1 [*Woman under Socialism*. Interestingly, in the English translation by Daniel De Leon (1904), '*Geschlechtstrieb*' is translated as 'sexual instinct'. See footnote 2 below.]

2 [For a discussion of the translation of the German words '*Geschlecht*' and '*Trieb*', see *RSE*, **24**, 67–8 and 85–8.]

forgets – the sexual drive."[1] Otherwise the text contains various statistics on topics with which the sexual drive is not directly, or at least not fundamentally, connected: population growth, infant mortality, etc. Hegar has scarcely a word to say about the crux of the entire problem: the fact that man is forced to spawn his children as unintentional by-products of the satisfaction of a natural need – or else to harm his health; and he has no appreciation of the significance of the attempts directed towards separating conception from coitus without disturbance of health![2]

1 [This marginal gloss can be found on p. 51 of Freud's copy of Hegar's book (now in the Freud Museum, London). It establishes beyond reasonable doubt Freud's authorship of this review, which is merely signed 'F.'. Curiously, however, Freud did not quote this marginal gloss entirely accurately; the word 'simply' does not appear in the original.]

2 [The subject of contraception is discussed in various places, including the Fliess correspondence, especially 'Draft B' (*RSE*, **1**, 211 f.). See also the 'Anxiety Neurosis' paper (1895*b*), p. 90 above, 'Sexuality in the Aetiology of the Neuroses' (1898*a*), p. 271 f. below, '"Civilized" Sexual Morality' (1908*d*), *RSE*, **9**, 169, and 'More Children' (1910–11*a*), ibid., **12**, 341.]

HEREDITY AND THE AETIOLOGY OF THE NEUROSES

(1896)

EDITORS' NOTE

L'HÉRÉDITÉ ET L'ÉTIOLOGIE DES NÉVROSES

FRENCH EDITIONS

1896 *Rev. neurol.*, **4** (6), 161–9. (March 30.) [142]
1906 *SKSN*, **1**, 135–48. (1911, 2nd ed.; 1920, 3rd ed.; 1922, 4th ed.)
1925 *GS*, **1**, 388–403.
1952 *GW*, **1**, 407–22.

ENGLISH TRANSLATIONS

'Heredity and the Aetiology of the Neuroses'
1924 *CP*, **1**, 138–54. (Tr. M. Meyer.)
1962 *SE*, **3**, 143–56. (Tr. J. Strachey.)

Included (No. XXXVII) in Freud's own collection of abstracts of his early works (1897*b*). The original is in French. The present translation is a revised and corrected reprint of the *SE* version.

This paper and the next one, the second on the neuropsychoses of defence (1896*b*), were sent off to their respective publishers on the same day, February 5, 1896, as Freud reported to Fliess in a letter the day after (Freud, 1950*a*, Letter 40). The French paper was published at the end of March, some six weeks before the other, and it consequently has priority over it for the first published appearance of the word 'psychoanalysis' (p. 160 below). The paper is a summary of Freud's contemporary views on the aetiology of all four of what he then regarded as the main types of neurosis: the two 'psychoneuroses', hysteria and obsessional neurosis, and the two 'actual neuroses' (as they were later to be called, see footnote 1, p. 273 below), neurasthenia and anxiety neurosis. The earlier part of the paper is to a great extent a repetition of the discussion on aetiology in the second paper on anxiety neurosis (1895*f*), while the later part covers very briefly the same ground as its contemporary, the second paper on the neuropsychoses of defence (1896*b*). The reader may therefore be referred to these and to the editorial comments on them for further information.

HEREDITY AND THE AETIOLOGY OF THE NEUROSES

I am addressing in particular the disciples of J.-M. Charcot, in order to [143]
put forward some objections to the aetiological theory of the neuroses which was handed on to us by our teacher.

The role attributed in that theory to nervous heredity is well known: it is the sole true and indispensable cause of neurotic affections, and the other aetiological influences can aspire only to the name of *agents provocateurs*. Such was the opinion laid down by the great man himself and by his pupils, MM. Guinon, Gilles de la Tourette, Janet and others, in regard to the major neurosis, hysteria; and I believe the same view is held in France and in most other places in regard to the other neuroses, though, where these states analogous to hysteria are concerned, it has not been promulgated in so solemn and decided a manner.

I have long entertained doubts on this subject, but I have had to wait to find corroborative facts in my daily experience as a doctor. My objections are now of a double order: factual arguments and arguments derived from speculation. I will begin with the former, arranging them according to the importance I ascribe to them.

I

(*a*) Affections which are fairly often remote from the domain of neuropathology,[1] and which do not necessarily depend on a disease of the nervous system, have sometimes been regarded as nervous and as showing the presence of a hereditary neuropathic tendency. This has been so with true facial neuralgias and with many headaches which were thought to be nervous but which arose rather from post-infectious pathological changes and suppuration in the pharyngonasal cavities. I feel convinced that the patients would benefit if we were more often to hand over the treatment of these affections to the rhinological surgeons.

1 [See p. 12 *n.* 4 above.]

[144] (*b*) All the nervous affections found in a patient's family, without consideration of their frequence or severity, have been accepted as a basis for charging him with a hereditary nervous taint. Does not this way of looking at things imply drawing a sharp line between families which are clear of all nervous predisposition and families which are subject to them to an unlimited extent? And do not the facts argue in favour of the contrary view that there are transitions and degrees in nervous disposition and that no family escapes it altogether?

(*c*) Our opinion of the aetiological role of heredity in nervous illnesses ought decidedly to be based on an impartial statistical examination and not on a *petitio principii*. Until such an examination has been made we ought to believe that the existence of acquired nervous disorders is just as possible as that of hereditary ones. But if there can be nervous disorders that are acquired by people without a predisposition, it can no longer be denied that the nervous affections met with in our patient's relatives may partly have arisen in that way. It will then no longer be possible to quote them as conclusive evidence of the hereditary disposition imputed to the patient by reason of his family history, for a retrospective diagnosis of the illnesses of ancestors or absent members of a family can only very rarely be successfully made.

(*d*) Those who are adherents of M. Fournier and M. Erb in the matter of the part played by syphilis in the aetiology of tabes dorsalis and progressive paralysis have learnt that powerful aetiological influences must be recognized whose collaboration is indispensable for the pathogenesis of certain illnesses which could not be produced by heredity alone. Nevertheless, M. Charcot remained to the very last (as I know from a private letter I had from him) strictly opposed to Fournier's theory, which is, however, gaining ground every day.

(*e*) There is no doubt that certain nervous disorders can develop in people who are perfectly healthy and whose family is above reproach. This is a matter of daily observation in cases of Beard's neurasthenia; if neurasthenia were restricted to people who were predisposed, it would never have attained the importance and extent with which we are familiar.

(*f*) In nervous pathology there is *similar heredity* and what is known as *dissimilar heredity*. No objection can be made to the former; it is in fact
[145] a very remarkable thing that in the disorders which depend on similar heredity (Thomsen's disease, Friedreich's disease, the myopathies, Huntington's chorea, etc.) we never come across a trace of any other accessory aetiological influence. But dissimilar heredity, which is much

more important than the other, leaves gaps which would have to be filled before a satisfactory solution to aetiological problems could be reached. Dissimilar heredity consists in the fact that the members of the same family are found to be affected by the most various nervous disorders, functional and organic, without its being possible to discover any law determining the replacement of one illness by another or the order of their succession through the generations. Alongside of the sick members of these families there are others who remain healthy; and the theory of dissimilar heredity does not tell us why one person tolerates the same hereditary load without succumbing to it or why another person, who is sick, should choose this particular nervous affection from among all the illnesses which make up the great family of nervous diseases instead of choosing another one – hysteria instead of epilepsy or insanity, and so on. Since there is no such thing as chance in neurotic pathogenesis any more than anywhere else, it must be allowed that it is not heredity that presides over the choice of the particular nervous disorder which is to develop in the predisposed member of a family, but that there are grounds for suspecting the existence of other aetiological influences, of a less incomprehensible[1] nature, which would then deserve to be called the *specific aetiology* of such and such a nervous affection. Without the existence of this special aetiological factor, heredity could have done nothing; it would have lent itself to the production of another nervous disorder if the specific aetiology in question had been replaced by some other influence.

II

There has been too little research into these specific and determining causes of nervous disorders, for the attention of physicians has remained [146] dazzled by the grandiose prospect of the aetiological precondition of heredity. Those causes nevertheless deserve to be made the object of industrious study. Although their pathogenic power is in general only accessory to that of heredity, great practical interest attaches to the knowledge of this specific aetiology; it will allow our therapeutic efforts to find a path of access, whereas hereditary disposition, which is

1 [The original publication of 1896 gives '*compréhensible*'. All the subsequent reprints from 1906 up to and including 1925 give '*incompréhensible*'; but the latest reprint (*GW*, 1952) returns to the original '*compréhensible*'. Arguments can be found in favour of either alternative. Cf. Editors' Note to 'Obsessions and Phobias', p. 66 above.]

something fixed in advance for the patient from his birth, brings our efforts to a halt with its unapproachable power.[1]

I have been engaged for years in researches into the aetiology of the major neuroses (functional nervous states analogous to hysteria) and it is the result of those studies that I propose to describe to you in the following pages. To avoid any possible misunderstanding I shall begin by making two remarks on the nosography of the neuroses and on the aetiology of the neuroses in general.

I was obliged to begin my work with a nosographic innovation. I found reason to set alongside of hysteria the obsessional neurosis [*névrose des obsessions*][T] (*Zwangsneurose*)[2] as a self-sufficient and independent disorder, although the majority of the authorities place obsessions [*les obsessions*] among the syndromes constituting mental degeneracy or confuse them with neurasthenia. I for my part, by examining the psychical mechanism of obsessions, had learnt that they are connected with hysteria more closely than one might suppose.

Hysteria and obsessional neurosis form the first group of the major neuroses studied by me. The second contains Beard's neurasthenia, which I have divided up into two functional states separated by their aetiology as well as by their symptomatic appearance – *neurasthenia* proper and the *anxiety neurosis* [*névrose d'angoisse*] (*Angstneurose*),[2] a name which, I may say in passing, I am not pleased with myself. I gave my detailed reasons for making this separation, which I consider necessary, in a paper published in 1895 [Freud, 1895*b*].

As regards the aetiology of the neuroses, I think it should be recognized in theory that aetiological influences, differing among themselves in their importance and in the manner in which they are related to the effect they
[147] produce, can be grouped in three classes:[3] (1) *Preconditions*, which are indispensable for producing the disorder concerned but which are of a general nature and are equally met with in the aetiology of many other disorders; (2) *Concurrent Causes*, which share the character of preconditions in that they function in the causation of other disorders as well as in that of the disorder under consideration, but which are not indispensable for the production of the latter; and (3) *Specific Causes*, which are as indispensable as the preconditions, but are of a limited nature and appear only in the aetiology of the disorder for which they are specific.

1 [In the 1952 edition only, this clause was changed to 'opposes an unapproachable obstacle to our efforts'.]

2 [German in the French original. Cf. Editors' Note to 'Obsessions and Phobias', p. 66 above.]

3 [Much of what follows for the next few pages is a close repetition of the latter part of the second paper on anxiety neurosis (1895*f*), p. 120 ff. above.]

In the pathogenesis of the major neuroses, then, heredity fulfils the role of a *precondition*, powerful in every case and even indispensable in most cases. It could not do without the collaboration of the specific causes; but the importance of hereditary disposition is proved by the fact that the same specific causes acting on a healthy individual produce no manifest pathological effect, whereas in a predisposed person their action causes the neurosis to come to light, whose development will be proportionate in intensity and extent to the degree of the hereditary precondition.

Thus the action of heredity is comparable to that of a multiplier in an electric circuit, which exaggerates the visible deviation of the needle, but which cannot determine its direction.

There is yet another thing to be noted in the relations between the hereditary precondition and the specific causes of neuroses. Experience shows – what one might have guessed in advance – that in these questions of aetiology one should not neglect the relative quantities, so to speak, of the aetiological influences. But one could not have guessed the following fact, which seems to arise from my observations: namely that heredity and the specific causes can replace each other as regards quantity, that the same pathological effect will be produced by the coincidence of a very serious specific aetiology with a moderate disposition or of a severely loaded nervous heredity with a slight specific influence. And we shall simply be meeting not unexpected extreme instances in this series if we come upon cases of neurosis in which we shall look in vain for any appreciable degree of hereditary disposition, provided that what is lacking is [148]
made up for by a powerful specific influence.

As *concurrent* (or auxiliary) *causes* of neuroses may be enumerated all the stock agents met with elsewhere: emotional disturbance, physical exhaustion, acute illnesses, intoxications, traumatic accidents, intellectual overwork, etc. I maintain that none of these, not even the last, enters into the aetiology of the neuroses regularly or necessarily, and I am aware that to declare this opinion is to put oneself in direct opposition to a theory which is looked upon as universally accepted and irreproachable. Since Beard declared that neurasthenia was the fruit of our modern civilization, he has only met with believers; but I find it impossible to accept this view. A laborious study of the neuroses has taught me that the specific aetiology of the neuroses has escaped Beard's notice.[1]

I have no desire to depreciate the aetiological importance of these stock agents. Since they are very various, occur very frequently and are

1 [Freud discussed this question more fully ten years later in his paper on '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), *RSE*, **9**, 159 ff., and, of course, in many later writings.]

most often named by patients themselves, they become more prominent than the specific causes of the neuroses – an aetiology which is either hidden or unknown. Fairly frequently they fulfil the function of *agents provocateurs* which render manifest a neurosis that has previously been latent; and a practical interest attaches to them, for a consideration of these stock causes may offer lines of approach to a therapy which does not aim at a radical cure and is content with repressing [*refouler*] the illness to its former state of latency.

But it is not possible to establish any constant and close relation between one of these stock causes and one or other form of nervous affection. Emotional disturbance, for instance, is found equally in the aetiology of hysteria, obsessions and neurasthenia, as well as in that of epilepsy, Parkinson's disease, diabetes and many others.

Stock concurrent causes can also replace the specific aetiology in respect of quantity, but can never take its place entirely. There are numerous cases in which all the aetiological influences are represented by the hereditary precondition and the specific cause, stock causes being absent.
[149] In the other cases the indispensable aetiological factors are not in themselves sufficient in quantity to bring about an outbreak of neurosis; a state of apparent health may be maintained for a long time, though it is in reality a state of predisposition to neurosis. It is then enough for a stock cause to come into action as well, and the neurosis becomes manifest. But it must be clearly pointed out that under these conditions the nature of the stock cause which supervenes is a matter of complete indifference – whether it is an emotion, a trauma, an infectious illness or anything else. The pathological effect will not be modified according to this variation; the nature of the neurosis will always be dominated by the pre-existing specific cause.

What, then, are the specific causes of neuroses? Is there a single one or are there several? And is it possible to establish a constant aetiological relation between a particular cause and a particular neurotic effect, in such a way that each of the major neuroses can be attributed to a special aetiology?

On the basis of a laborious examination of the facts, I shall maintain that this last supposition is quite in agreement with reality, that each of the major neuroses which I have enumerated has as its immediate cause one particular disturbance of the economics of the nervous system [*l'économie nerveuse*],[1] and that these functional pathological

1 [This notion is a predecessor of the 'economic point of view' in metapsychology. See above, p. 58 ff.]

modifications *have as their common source the subject's sexual life, whether they lie in a disorder of his contemporary sexual life or in important events in his past life.*

This, to tell the truth, is no new, unheard-of proposition. Sexual disorders have always been admitted among the causes of nervous illness, but they have been subordinated to heredity and coordinated with the other *agents provocateurs*; their aetiological influence has been restricted to a limited number of observed cases. Physicians had even fallen into the habit of not investigating them unless the patient brought them up himself. What gives its distinctive character to my line of approach is that I elevate these sexual influences to the rank of specific causes, that I recognize their action in every case of neurosis, and finally that I trace a regular parallelism, a proof of a special aetiological relation between the nature of the sexual influence and the pathological species of the neurosis.

I am quite sure that this theory will call up a storm of contradictions [150]
from contemporary physicians. But this is not the place in which to present the documents and the experiences which have forced me to my conviction, nor to explain the true meaning of the rather vague expression 'disorders of the economics of the nervous system'. This will be done, most fully, I hope, in a work on the subject which I have in preparation.[1] In the present paper I limit myself to reporting my findings.

Neurasthenia proper, if we detach anxiety neurosis from it, has a very monotonous clinical appearance: fatigue, intracranial pressure, flatulent dyspepsia, constipation, spinal paraesthesias, sexual weakness, etc. The only specific aetiology it allows of is (immoderate) masturbation or spontaneous emissions.

It is the prolonged and intense action of this pernicious sexual satisfaction which is enough on its own account to provoke a neurasthenic neurosis or which imposes on the subject the special neurasthenic stamp that is manifested later under the influence of an incidental accessory cause. I have also come across people presenting the indications of a neurasthenic constitution in whom I have not succeeded in bringing to light the aetiology I have mentioned; but I have at least shown that the sexual function has never developed to its normal level in these patients; they seemed to have been endowed by heredity with a sexual constitution analogous to what is brought about in a neurasthenic as a result of masturbation.[2]

1 [See footnote 2, p. 173 below.]

2 [See a fuller discussion of masturbation in 'Sexuality in the Aetiology of the Neuroses' (1898*a*), p. 269 f. below.]

The anxiety neurosis exhibits a much richer clinical picture: irritability, states of anxious expectation, phobias, anxiety attacks, complete or rudimentary, attacks of fear and of vertigo, tremors, sweating, congestion, dyspnoea, tachycardia, etc., chronic diarrhoea, chronic locomotor vertigo, hyperaesthesia, insomnia, etc.[1] It is easily revealed as being the specific effect of various disorders of sexual life which possess a characteristic common to all of them. Enforced abstinence, unconsummated[2] genital excitation [*l'irritation*] (excitation which is not relieved by a sexual act), coitus which is imperfect or interrupted (which does not end in gratification), sexual efforts which exceed the subject's psychical capacity, etc. – all these agents, which occur only too frequently in modern life, seem to agree in the fact that they disturb the equilibrium of the psychical and somatic functions in sexual acts, and that they prevent the psychical participation necessary in order to free the nervous economy from sexual tension.

[151]

These remarks, which perhaps contain the germ of a theoretical explanation of the functional mechanism of the neurosis in question, give rise already to a suspicion that a complete and truly scientific exposition of the subject is not possible at the present time, and that it would be necessary to start off by approaching the physiological problem of sexual life from a fresh angle.

I will say finally that the pathogenesis of neurasthenia and anxiety neurosis can easily do without the cooperation of a hereditary disposition. That is the outcome of daily observation. But if heredity is present, the development of the neurosis will be affected by its powerful influence.

As regards the second class of major neuroses, hysteria and obsessional neurosis, the solution to the aetiological problem is of surprising simplicity and uniformity. I owe my results to a new method of psychoanalysis [*psychoanalyse*],[3] Josef Breuer's exploratory procedure; it is a little intricate, but it is irreplaceable, so fertile has it shown itself to be in throwing light upon the obscure paths of unconscious ideation [*l'ideation inconsciente*]. By means of that procedure – this is not the place in which to describe it[4] – hysterical symptoms are traced back to their origin, which

1 For the symptomatology as well as for the aetiology of anxiety neurosis, see my paper referred to above [Freud, 1895*b*].

2 ['*Fruste*' in the original. See footnote 1, p. 74 above.]

3 [This was the word's first published appearance (cf. p. 44 *n.* 2 above).]

4 See *Studies on Hysteria*, by Breuer & Freud, 1895*d*.

is always found in some event of the subject's sexual life appropriate for the production of a distressing emotion [*émotion*]. Travelling backwards into the patient's past, step by step, and always guided by the organic train of symptoms and of memories and thoughts aroused, I finally reached the starting point of the pathological process; and I was obliged to see that at bottom the same thing was present in all the cases submitted [152] to analysis – the action of an agent which must be accepted as the specific cause of hysteria.

This agent is indeed a memory relating to sexual life; but it is one which presents two characteristics of the first importance. The event of which the subject has retained an unconscious memory is *a precocious experience of sexual relations with actual excitement of the genitals, resulting from sexual abuse committed by another person*; and *the period of life* at which this fatal event takes place is *earliest youth* – the years up to the age of eight to ten, before the child has reached sexual maturity.[1]

A passive sexual experience before puberty: this, then, is the specific aetiology of hysteria.

I will without delay add some factual details and some commentary to the result I have announced, in order to combat the scepticism with which I expect to meet. I have been able to carry out a complete psychoanalysis in thirteen cases of hysteria, three of that number being true combinations of hysteria and obsessional neurosis. (I do not speak of hysteria *with* obsessions.) In none of these cases was an event of the kind defined above missing. It was represented either by a brutal assault committed by an adult or by a seduction less rapid and less repulsive, but reaching the same conclusion. In seven out of the thirteen cases the intercourse was between children on both sides – sexual relations between a little girl and a boy a little older (most often her brother) who had himself been the victim of an earlier seduction. These relations sometimes continued for years, until the little guilty parties reached puberty; the boy would repeat the same practices with the little girl over and over again and without alteration – practices to which he himself had been subjected by some female servant or governess and which on account of their origin were often of a disgusting sort. In a few cases there was a combination of an assault and relations between children or a repetition of a brutal abuse.

1 [For this and what follows, compare the fuller discussion, accompanied by Freud's later critical comments, in his second paper on the neuropsychoses of defence (1896*b*), p. 173 ff. below. This is the first occasion that Freud's 'seduction theory' appeared in print. See Editors' Note below, p. 169.]

The date of this precocious experience varied. In two cases the series started in the little creature's second year (?);[1] the commonest age in my
[153] observations is the fourth or fifth year. It may be somewhat by accident, but I have formed an impression from this that a passive sexual experience occurring only after the age of from eight to ten is no longer able to serve as the foundation of the neurosis.

How is it possible to remain convinced of the reality of these analytic confessions which claim to be memories preserved from the earliest childhood? and how is one to arm oneself against the tendency to lies and the facility of invention which are attributed to hysterical subjects? I should accuse myself of blameworthy credulity if I did not possess more conclusive evidence. But the fact is that these patients never repeat these stories spontaneously, nor do they ever in the course of a treatment suddenly present the physician with the complete recollection of a scene of this kind. One only succeeds in awakening the psychical trace of a precocious sexual event under the most energetic pressure of the analytic procedure, and against an enormous resistance [*résistance*]. Moreover, the memory must be extracted from them piece by piece, and while it is being awakened in their consciousness they become prey to an emotion which it would be hard to counterfeit.

Conviction will follow in the end, even if one is not influenced by the patients' behaviour, provided that one can follow in detail the report of a psychoanalysis of a case of hysteria.

The precocious event has left an indelible imprint on the history of the case; it is represented in it by a host of symptoms and of special features which could be accounted for in no other way; it is peremptorily called for[2] by the subtle but solid interconnections of the intrinsic structure of the neurosis; the therapeutic effect of the analysis lags behind if one has not penetrated so far; and one is then left with no choice but to reject or to believe the whole.

Is it understandable that a precocious sexual experience of this kind, undergone by an individual whose sex is barely differentiated, can become the source of a persistent psychical abnormality like hysteria?
[154] And how would this supposition fit in with our present ideas on the psychical mechanism of that neurosis? A satisfactory reply can be given to the first of these questions. It is precisely because the subject is in his infancy that the precocious sexual excitation produces little or no effect

1 [The question mark is in the original.]

2 [The original publication (1896) gives '*régi*' ('governed'). All the subsequent reprints from 1906 up to and including 1925 give '*exigé*' ('called for'); but the latest reprint (*GW*, 1952) returns to the original '*régi*'. Cf. the Editors' Note to 'Obsessions and Phobias', p. 66 above.]

at the time; but its psychical trace is preserved. Later, when at puberty the reactions of the sexual organs have developed to a level incommensurable with their infantile condition, it comes about in one way or another that this unconscious psychical trace is awakened. Thanks to the change due to puberty, the memory will display a power which was completely lacking from the event itself. *The memory will operate as though it were a contemporary event*. What happens is, as it were, *a posthumous action* [*action posthume*][1] *by a sexual trauma*.

So far as I can see, this awakening of a sexual memory after puberty, when the event itself has happened at a time long before that period, forms the only psychological instance of the immediate effect of a *memory* surpassing that of an actual event. But the constellation is an abnormal one, which touches a weak side of the psychical mechanism and is bound to produce a pathological psychical effect.

I believe I can see that *this inverse relation between the psychical effect of the memory and of the event* contains the reason for *the memory remaining unconscious*.

In this way we arrive at a very complex psychical problem, but one which, properly appreciated, promises to throw a vivid light on the most delicate questions of psychical life.[2]

The ideas put forward here, which have as their starting point the finding of psychoanalysis to the effect that a memory of a precocious sexual experience is always found as the specific cause of hysteria, are not in harmony with the psychological theory of neuroses held by M. Janet, nor with any other; but they agree perfectly with my own speculations on the '*Abwehrneurosen*'[3] [neuroses of defence], as I have developed them elsewhere.[4]

All the events subsequent to puberty to which an influence must be attributed upon the development of the hysterical neurosis and upon the [155]
formation of its symptoms are in fact only concurrent causes – '*agents provocateurs*' as Charcot used to say, though for him nervous heredity occupied the place which I claim for the precocious sexual experience. These accessory agents are not subject to the strict conditions imposed

1 [This is an early description of the process of '*Nachträglichkeit*'[T] ('deferred action'). The concept is more elaborately introduced below, in the contemporaneous paper on the neuropsychoses of defence (1896*b*), p. 177 *n*. 1. It also appeared frequently in the Fliess correspondence (1950*a*; *RSE*, **1**).]

2 [The subject of these last four paragraphs is discussed by Freud at greater length in a footnote to Section I of the second paper on the neuropsychoses of defence, p. 177 *n*. 1 below.]

3 [German in the original.]

4 [Cf. Freud's two papers on the subject, 1894*a* and 1896*b*.]

on the specific causes; analysis demonstrates in an irrefutable fashion that they enjoy a pathogenic influence for hysteria only owing to their faculty for awakening the unconscious psychical trace of the childhood event. It is also thanks to their connection with the primary pathogenic impression, and inspired by it, that their memories will become unconscious in their turn and will be able to assist in the growth of a psychical activity withdrawn from the power of the conscious functions.

The obsessional neurosis (*Zwangsneurose*)[1] arises from a specific cause very analogous to that of hysteria. Here too we find a precocious sexual event, occurring before puberty, the memory of which becomes active during or after that period; and the same remarks and arguments which I put forward in connection with hysteria will apply to my observations of the other neurosis (six cases, three of which were pure ones). There is only one difference which seems capital. At the basis of the aetiology of hysteria we found an event of passive sexuality, an experience submitted to with indifference or with a small degree of annoyance or fright. In obsessional neurosis it is a question, on the other hand, of an event which has given *pleasure*, of an act of aggression inspired by desire [*désir*] (in the case of a boy) or of a participation in sexual relations accompanied by enjoyment (in the case of a little girl). The obsessional ideas, when their intimate meaning has been recognized by analysis, when they have been reduced, as it were, to their simplest expression, are nothing other than *reproaches addressed by the subject to himself on account of this anticipated sexual enjoyment*, but reproaches distorted by an unconscious psychical work of transformation and substitution.[2]

The very fact of sexual aggressions of this kind taking place at such a tender age seems to reveal the influence of a previous seduction of which the precocity of sexual desire would be the consequence. In the cases
[156] analysed by me analysis confirms this suspicion. In this way an interesting fact is explained which is always found in these cases of obsessions: the regular complication of the framework of symptoms by a certain number of symptoms which are simply hysterical.

The importance of the active element in sexual life as a cause of obsessions, and of sexual passivity for the pathogenesis of hysteria, even seems to unveil the reason for the more intimate connection of hysteria with the female sex and the preference of men for obsessional neurosis.[3] One

1 [German in the original.]

2 [Cf. the fuller parallel account in the following paper, p. 178 ff. below.]

3 [Freud remarked upon this again thirty years later, at the end of Chapter VIII of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 127: 'There is no doubt that hysteria has a strong affinity with femininity, just as obsessional neurosis has with masculinity.']

sometimes comes across a pair of neurotic patients who were a pair of little lovers in their earliest childhood – the man suffering from obsessions and the woman from hysteria. If they are a brother and sister, one might mistake for a result of nervous heredity what is in fact the consequence of precocious sexual experiences.

There are no doubt pure and isolated cases of hysteria or obsessions, independent of neurasthenia or anxiety neurosis; but this is not the rule. A psychoneurosis[1] appears more often as an accessory to a neurasthenic neurosis, provoked by it and following its decline. This is because the specific causes of the latter, the contemporary disorders of sexual life, operate at the same time as auxiliary causes of the psychoneuroses, whose specific cause, the memory of the precocious sexual experience, they awaken and revive.[2]

As regards nervous heredity, I am far from being able to estimate correctly its influence in the aetiology of the psychoneuroses. I admit that its presence is indispensable for severe cases; I doubt if it is necessary for slight ones; but I am convinced that nervous heredity by itself is unable to produce psychoneuroses if their specific aetiology, precocious sexual excitation, is missing. I even believe that the decision as to which of the neuroses, hysteria or obsessions, will develop in a given case is not decided by heredity but a special characteristic of the sexual event in earliest childhood.[3]

1 [This is Freud's first published use of the term. It had appeared in the 'Project' of 1895 (1950*a*), *RSE*, **1**, 361. As Freud explains in this passage, the term contrasts with 'actual neurosis'. Cf. ibid., **24**, 56.]

2 [This point, once more, is dealt with more fully below, p. 177 f.]

3 [The problem of the 'choice of neurosis' was beginning to interest Freud. Cf. pp. 178 and 198 below.]

FURTHER REMARKS ON THE NEUROPSYCHOSES OF DEFENCE

Included (No. XXXV) in Freud's own collection of abstracts of his early works (1897*b*). The present translation is a revised and corrected reprint of the *SE* version.

This paper, as explained above on p. 151, was sent off by Freud on the same day (February 5, 1896) as the French paper on 'Heredity and the Aetiology of the Neuroses' but was published some six weeks after it. When this paper came to be included in the *Gesammelte Schriften*, in 1925, Freud added two or three footnotes. He had previously made a substantial addition to a footnote in the English translation of 1924 (pp. 188–9 below); but this was not included in any German edition.

This second paper on the 'neuropsychoses of defence' takes up the discussion at the point it had reached in the first paper (1894*a*) produced two years earlier. Many of the conclusions reached here, principally concerning the 'seduction theory' and [160] 'deferred action', had been very briefly anticipated in the contemporary French paper on heredity (1896*a*); the essential part of the work had been communicated a few weeks earlier to Fliess in a long document headed by Freud 'A Christmas Fairy Tale' and dated January 1, 1896 (Freud, 1950*a*, Draft K; *RSE*, **1**, 248 ff.). Like its predecessor of 1894, the present work is divided into three sections, dealing respectively

with hysteria, obsessions and psychotic states, and in each case we are presented with the results of two years of further investigation. In the earlier paper the stress was already on the concept of 'defence' or 'repression'; here there is a much closer examination of what it is against which the defence is brought into operation, and the conclusion is in every case that the responsible factor is a *sexual* experience of a traumatic nature – in the case of hysteria a *passive* experience, in that of obsessions an *active* one, though even here an earlier passive experience lay in the remoter background. In other words the ultimate cause was always the seduction of a child by an adult. Cf. 'The Aetiology of Hysteria' (1896*c*), pp. 214–15 below. Further, the actual traumatic event always occurred before the age of puberty, though the outbreak of the neurosis occurred *after* puberty.[1]

As can be seen from Freud's additional footnote on p. 178 *n.* 1, this whole position was later abandoned by him, and its abandonment signalized a turning point in his views that was of major importance. In a letter to Fliess of September 21, 1897 (Freud, 1950*a*, Letter 69), he revealed that for some months it had been dawning on him that it was hardly credible that perverse acts against children were so general – especially since in every case it was the father who had to be held responsible for them. But it was not for several years that he gave public expression to his changed opinions.[2] The important consequence of this realization, however, was that Freud became aware of the part played by phantasy in mental events, and this opened the door to the discovery of infantile sexuality and of the Oedipus complex. A more detailed
[161] account of the changes in his views on this subject is given in the Editors' Note to the *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, 111 ff., while a further development is recorded in Freud's late paper on 'Female Sexuality' (1931*b*), ibid., **21**, 227, where the girl's early phantasies of being seduced by her father are traced back to her even earlier relations with her mother.

Incidentally, the problem of how it could be that the *memory* of an infantile trauma could have so much greater an effect than the actual experience of it at the time – a problem discussed repeatedly by Freud at this period and elaborately accounted for in the long footnote on p. 177 below – was fundamentally reconfigured by the discovery of infantile sexuality and the recognition of the persistence of unconscious drive impulses.

It is perhaps of still greater interest to observe the emergence in this paper of several new psychological *mechanisms*, which were to play a very large part in Freud's subsequent accounts of mental processes. Especially remarkable is the elaborate analysis of obsessional mechanisms, which anticipates much that was to appear fifteen years later in the theoretical section of the 'Rat Man' analysis (1909*d*), *RSE*, **10**. Thus, we find early allusions to the view of obsessions as self-reproaches (p. 179 below), to the notion of symptoms implying a failure of defence and a 'return of the repressed' (ibid.), and to the far-reaching theory that symptoms are compromises between repressed and repressing forces (ibid.). Finally, in the section on paranoia, the concept of 'projection' makes its first unequivocal appearance (p. 191), and, in the concept of an 'alteration of the ego' at the very end of the paper (a concept already

1 These findings had been presented to Fliess in outline some months earlier (from October 8, 1895 onwards). Cf. also the long footnote on p. 177 below.

2 In his contribution to Löwenfeld's *Sexualleben und Nervenleiden* on the part played by sexuality in the neuroses (1906*a*), *RSE*, **7**, 283–5.

present in Draft K of the Fliess correspondence), we may see a foreshadowing of ideas which reappear in some of Freud's very last writings, for instance in 'Analysis Terminable and Interminable' (1937*c*), *RSE*, **23**.

FURTHER REMARKS ON THE NEUROPSYCHOSES OF DEFENCE

[INTRODUCTION]

In a short paper published in 1894, I grouped together hysteria, obsessions [*Zwangsvorstellungen*][T] and certain cases of acute hallucinatory confusion under the name of 'neuropsychoses of defence' [*Abwehr-Neuropsychosen*][t] [Freud, 1894*a*], because those affections turned out to have one aspect in common. This was that their symptoms arose through the psychical mechanism of (unconscious) *defence* [*Abwehr*][T] – that is, in an attempt to repress [*verdrängen*][T] an incompatible idea [*Vorstellung*][T] which had come into distressing opposition to the patient's ego [*Ich*][T]. In some passages in a book which has since appeared by Dr J. Breuer and myself (*Studies on Hysteria* [1895*d*]) I have been able to elucidate, and to illustrate from clinical observations, the sense in which this psychical process of 'defence' or 'repression' is to be understood. There, too, some information is to be found about the laborious but completely reliable method of psychoanalysis[1] used by me in making those investigations – investigations which also constitute a therapeutic procedure. [162] *Zwang*

My observations during my last two years of work have strengthened me in the inclination to look on defence as the nuclear point in the psychical mechanism of the neuroses in question; and they have also enabled me to give this psychological theory a clinical foundation. To my own surprise, I have come upon a few simple, though narrowly circumscribed, solutions to the problems of neurosis, and in the following pages I shall give a preliminary and brief account of them. In this kind of communication it is not possible to bring forward the evidence needful to support my assertions, but I hope to be able to fulfil this obligation later in a detailed presentation.[2]

1 [The first appearance of the term in German. Cf. above, p. 151.]

2 [Very soon after writing this, on March 16, 1896, Freud reported to Fliess (Freud, 1950*a*, Letter 43): 'My scientific work is going forward gradually. Today, like a budding poet, I wrote at the top of a sheet of paper:

Lectures on the Major Neuroses
(Neurasthenia, Anxiety Neurosis, Hysteria, Obsessional Neurosis)

. . . Behind this there looms another and finer work:

Psychology and Psychotherapy of the Neuroses of Defence.'

But, apart from a few unpublished lectures and the two or three papers that follow in the present volume, nothing immediate was to come of this. Other matters, Freud's self-analysis and the problem of dreams, were soon to absorb his interest.]

I. THE 'SPECIFIC' AETIOLOGY OF HYSTERIA[1]

[163] In earlier publications, Breuer and I have already expressed the opinion that the symptoms of hysteria can only be understood if they are traced back to experiences which have a 'traumatic' effect, and that these psychical traumas refer to the patient's sexual life.[2] What I have to add here, as a uniform outcome of the analyses carried out by me on thirteen cases of hysteria, concerns on the one hand the *nature* of those sexual traumas, and, on the other, the period of life in which they occur. In order to cause hysteria, it is not enough that there should occur at some period of the subject's life an event which touches his sexual existence and becomes pathogenic through the release and suppression of a distressing affect. On the contrary, *these sexual traumas must have occurred in early childhood (before puberty), and their content must consist of an actual irritation of the genitals (of processes resembling copulation).*

I have found this specific determinant of hysteria – *sexual passivity during the presexual period* – in every case of hysteria (including two male cases) which I have analysed. How greatly the claims of hereditary disposition are diminished by the establishment in this way of accidental aetiological factors as a determinant needs no more than a mention. Furthermore, a path is laid open to an understanding of why hysteria is far and away more frequent in members of the female sex; for even in childhood they are more liable to provoke sexual attacks.

[164] The most immediate objections to this conclusion will probably be that sexual assaults on small children happen too often for them to have any aetiological importance, or that these sorts of experiences are bound to be without effect precisely because they happen to a person who is sexually undeveloped; and further, that one must beware of forcing on patients supposed reminiscences of this kind by questioning them, or of believing in the romances which they themselves invent. In reply to the latter objections we may ask that no-one should form too certain judgements in this obscure field until he has made use of the only method which can throw light on it – of psychoanalysis for the purpose of making conscious what has so far been unconscious.[3] What is essential in the first objections can

1 [Much of the material in this section is repeated or expanded in the following paper (1896*c*), p. 209 ff. below.]

2 [Cf. the Breuer & Freud 'Preliminary Communication' (1893*a*) and Freud's first paper on the neuropsychoses of defence (1894*a*).]

3 I myself am inclined to think that the stories of being assaulted which hysterics so frequently invent may be obsessional fictions [*Zwangsdichtungen*] which arise from the memory trace of a childhood trauma.

be disposed of by pointing out that it is not the experiences themselves which act traumatically but their revival [*Wiederbelebung*] as a *memory* after the subject has entered on sexual maturity.

My thirteen cases were without exception of a severe kind; in all of them the illness was of many years' duration, and a few came to me after lengthy and unsuccessful institutional treatment. The childhood traumas which analysis uncovered in these severe cases had all to be classed as grave sexual injuries; some of them were positively revolting. Foremost among those guilty of abuses like these, with their momentous consequences, are nursemaids, governesses and domestic servants, to whose care children are only too thoughtlessly entrusted; teachers, moreover, figure with regrettable frequency.[1] In seven out of these thirteen cases, however, it turned out that blameless children were the assailants; these were mostly brothers who for years on end had carried on sexual relations with sisters a little younger than themselves. No doubt the course of events was in every instance similar to what it was possible to trace with certainty in a few individual cases: the boy, that is to say, had been [165] abused by someone of the female sex, so that his libido was prematurely aroused, and then, a few years later, he had committed an act of sexual aggression against his sister, in which he repeated precisely the same procedures to which he himself had been subjected.

Active masturbation must be excluded from my list of the sexual noxae in early childhood which are pathogenic for hysteria. Although it is found so very often side by side with hysteria, this is due to the circumstance that masturbation itself is a much more frequent consequence of abuse or seduction than is supposed.

It is not at all rare for both of the two children to fall ill later on of a defence neurosis – the brother with obsessions and the sister with hysteria. This naturally gives the appearance of a familial neurotic disposition. Occasionally, however, this pseudoheredity is resolved in a surprising fashion. In one of my cases a brother, a sister and a somewhat older male cousin were all of them ill. From the analysis which I carried out on the brother, I learnt that he was suffering from self-reproaches for being the cause of his sister's illness. He himself had been seduced by his cousin, and the latter, it was known in the family, had been the victim of his nursemaid.

1 [It may be remarked that in this published paper Freud does not mention the fact that with female patients the apparent seducer was so often their father, as he pointed out in the letter to Fliess quoted in the Editors' Note on p. 170 above. In the 1925 edition of *Studies on Hysteria* (1895*d*) Freud admitted to having suppressed this fact in two of the cases reported there (*RSE*, **2**, 119 *n.* and 151 *n.* 2).]

I cannot say for certain what the upper age limit is below which sexual injury plays a part in the aetiology of hysteria; but I doubt whether sexual passivity can bring on repression later than between the eighth and tenth years,[1] unless it is enabled to do so by previous experiences. The lower limit extends as far back as memory itself – that is, therefore, to the tender age of one and a half or two years! (I have had two cases of this.) In a number of my cases the sexual trauma (or series of traumas) occurred in the third and fourth years of life. I should not lend credence to these extraordinary findings myself if their complete reliability were not proved by the development of the subsequent neurosis. In every case a number of pathological symptoms, habits and phobias are only to be accounted for by going back to these experiences in childhood, and the logical structure of the neurotic manifestations makes it impossible to reject these faithfully preserved memories which emerge from childhood
[166] life. True, it would be useless to try to elicit these childhood traumas from a hysteric by questioning him outside psychoanalysis; their traces are never present in conscious memory, only in the symptoms of the illness.

All the experiences and excitations [*Erregungen*][T] which, in the period of life *after* puberty, prepare the way for, or precipitate, the outbreak of hysteria *demonstrably* have their effect only because they arouse [*erwecken*] the memory trace of these traumas in childhood, which do not thereupon become conscious but lead to a release of affect and to repression. This role of the later traumas tallies well with the fact that they are not subject to the strict conditions which govern the traumas in childhood but that they can vary in their intensity and nature, from actual sexual violation to mere sexual overtures or the witnessing of sexual acts in other people, or receiving information about sexual processes.[2]

In my first paper on the neuroses of defence [1894*a*] there was no explanation of how the efforts of the subject, who had hitherto been healthy, to forget a traumatic experience of this sort could have the result of actually effecting the intended repression and thus opening the door to the defence neurosis. It could not lie in the nature of the experiences,

1 [See Editors' addition to footnote 1, p. 177 below.]

2 In a paper on the anxiety neurosis [1895*b*, p. 89 above], I remarked that 'anxiety neurosis can be produced in girls who are approaching maturity by their first encounter with the problem of sex. . . . Such an anxiety neurosis is combined with hysteria in an almost typical fashion.' I know now that the occasion on which this 'virginal anxiety' breaks out in young girls does not actually represent their *first* encounter with sexuality, but that an experience of sexual passivity had previously occurred in their childhood, the memory of which is aroused by this 'first encounter'.

since other people remained healthy in spite of being exposed to the same precipitating causes. Hysteria, therefore, could not be fully explained from the effect of the trauma: it had to be acknowledged that the susceptibility to a hysterical reaction had already existed before the trauma.

The place of this indefinite hysterical disposition can now be taken, wholly or in part, by the posthumous operation of a sexual trauma in childhood. 'Repression' of the memory of a distressing sexual experience which occurs in maturer years is only possible for those in whom that experience can activate [*zu Wirkung bringen*] the memory trace of a trauma in childhood.[1]

Obsessions [*Zwangsvorstellungen*] similarly presuppose a sexual [167]
experience in childhood (though one of a different nature from that found in hysteria). The aetiology of these two neuropsychoses of defence is related as follows to the aetiology of the two simple neuroses,[2] neurasthenia and anxiety neurosis. Both the latter disorders are direct effects of
the sexual noxae themselves, as I have shown in my paper on anxiety [168]

1 A psychological theory of repression ought also to throw light on the question of why it is only ideas with a *sexual* content that can be repressed. Such an explanation might start out from the following indications. It is known that having ideas with a sexual content produces excitatory processes in the genitals which are similar to those produced by sexual experience itself. We may assume that this somatic excitation becomes transposed into the psychical sphere. As a rule the effect in question is much stronger in the case of the experience than in the case of the memory. But if the sexual experience occurs during the period of sexual immaturity and the memory of it is aroused during or after maturity, then the memory will have a far stronger excitatory effect than the experience did at the time it happened; and this is because in the meantime puberty has immensely increased the capacity of the sexual apparatus for reaction. An inverted relation of this sort between real experience and memory seems to contain the psychological precondition for the occurrence of a repression. Sexual life affords – through the retardation of pubertal maturity as compared with the psychical functions – the only possibility that occurs for this inversion of relative effectiveness. *The traumas of childhood operate in a deferred fashion* [*nachträglich*][T] *as though they were fresh experiences; but they do so unconsciously.* I must postpone entering into any more far-reaching psychological discussion till another occasion. Let me add, however, that the period of 'sexual maturity' which is in question here does not coincide with puberty but falls earlier (from the eighth to the tenth year). [This whole question of the deferred operation of early traumas had been discussed by Freud at great length in Sections 4, 5 and 6 of Part II of his 'Project' of 1895 (Freud, 1950*a*). It is also mentioned above in the French paper on heredity (1896*a*), p. 162 f., and further discussed at greater length in the paper which follows the present one, on the aetiology of hysteria (1896*c*), p. 217 f. below, as well as in several letters in the Fliess correspondence of this period, e.g. on March 1, May 30 and December 6, 1896 (Letters 42, 46 and 52). The age of eight to ten, mentioned in this footnote and elsewhere (e.g. p. 176 above), is shown by the later passage below (p. 217 f.) to refer to the period of the second dentition. At about this time Freud attached some particular importance to the part it played in sexual development, and it is repeatedly mentioned in the course of these discussions. Some elaborate chronological tables dealing with the age at which traumas and repression occurred and with the related problem of the 'choice of neurosis' can be found in the letters to Fliess referred to above. Cf. p. 170 f. An example of the deferred operation of early traumas is given in the analysis of 'Katharina' in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 117 f.]

2 [I.e. the 'actual neuroses'. See p. 273 *n*. 1 below.]

neurosis (1895*b*); both the defence neuroses are indirect consequences of sexual noxae which have occurred before the advent of sexual maturity – are consequences, that is, of the psychical memory traces of those noxae. The current [*aktuellen*][T] causes which produce neurasthenia and anxiety neurosis often at the same time play the part of exciting causes of the neuroses of defence; on the other hand, the specific causes of a defence neurosis – the traumas of childhood – can at the same time lay the foundations for a later development of neurasthenia. Finally, it not infrequently happens, too, that neurasthenia or anxiety neurosis is maintained, not by current [*aktuelle*] sexual noxae, but, instead, solely by the persisting effect of a memory of childhood traumas.[1]

Aktualneurose

II. THE NATURE AND MECHANISM OF OBSESSIONAL NEUROSIS

Sexual experiences of early childhood have the same significance in the aetiology of obsessional neurosis [*Zwangsneurose*] as they have in that of hysteria. Here, however, it is no longer a question of sexual *passivity*, but of acts of aggression carried out with pleasure and of pleasurable [*mit Lust*][T] participation in sexual acts – that is to say, of sexual *activity*. This difference in the aetiological circumstances is bound up with the fact that obsessional neurosis shows a visible preference for the male sex.

In all my cases of obsessional neurosis, moreover, I have found a *substratum of hysterical symptoms*[2] which could be traced back to a scene of sexual passivity that preceded the pleasurable action. I suspect that this coincidence is no fortuitous one, and that precocious sexual aggressivity always implies a previous experience of being seduced. However, I can as yet give no definitive account of the aetiology of obsessional neurosis; I only have an impression that the decision as to whether hysteria or obsessional neurosis will arise on the basis of traumas in childhood depends on *chronological* circumstances in the development of the libido.[3]

[169]

1 [*Footnote added* 1924:] This section is dominated by an error which I have since repeatedly acknowledged and corrected. At that time I was not yet able to distinguish between my patients' phantasies about their childhood years and their real recollections. As a result, I attributed to the aetiological factor of seduction [*Verführung*] a significance and universality which it does not possess. When this error had been overcome, it became possible to obtain an insight into the spontaneous manifestations of the sexuality of children which I described in my *Three Essays on the Theory of Sexuality* (1905*d*). Nevertheless, we need not reject everything written in the text above. Seduction retains a certain aetiological importance, and even today I think some of these psychological comments are to the point.

2 [Freud gave an example of this much later, in the 'Wolf Man' case history (1918*b*), *RSE*, **17**, 68, and he referred to the point again in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 101.]

3 [Cf. end of long footnote, p. 177 above.]

The nature of obsessional neurosis can be expressed in a simple formula. *Obsessional ideas* are invariably transformed *self-reproaches* which have re-emerged from *repression* and which always relate to some *sexual* act that was performed with pleasure *in childhood*.[1] In order to elucidate this statement it is necessary to describe the typical course taken by an obsessional neurosis.

In a first period – the period of childhood immorality – the events occur which contain the germ of the later neurosis. First of all, in earliest childhood, we have the experiences of sexual seduction that will later on make repression possible; and then come the acts of sexual aggression against the other sex, which will later appear in the form of acts involving self-reproach.

This period is brought to a close by the advent of sexual 'maturation', often itself unduly early. A self-reproach now becomes attached to the memory of these pleasurable actions; and the connection with the initial experience of passivity makes it possible [p. 176 f. above] – often only after conscious and remembered efforts – to repress them and to replace them by a *primary symptom of defence*. Conscientiousness, shame and self-distrust are symptoms of this kind, with which the third period begins – the period of *apparent* health, but actually, of successful defence.

The next period, that of the illness, is characterized by the *return of the repressed*[2] *memories* – that is, therefore, by the failure of the defence. It is not certain whether the awakening of those memories occurs more often accidentally and spontaneously or as a result of current [*aktueller*] [170]
sexual disturbances, as a kind of by-product of them. The reactivated memories, however, and the self-reproaches formed from them never re-emerge into consciousness unchanged: what become conscious as obsessional ideas and affects, and take the place of the pathogenic memories so far as conscious life is concerned, are structures in the nature of a *compromise* [*Kompromissbildungen*][T] between the repressed ideas and *Bildung*
the repressing ones.[3]

In order to describe clearly and with probable accuracy the processes of repression, the return of the repressed and the formation of pathological compromise ideas, one would have to make up one's mind to quite definite assumptions about the substratum of psychical events and of consciousness.[4] So long as one seeks to avoid this, one must be content

1 [Freud re-examined this definition critically at the beginning of Chapter II of his 'Rat Man' case history (1909*d*), *RSE*, **10**, 168.]

2 [The first published appearance of the phrase.]

3 [This last sentence, too, was quoted in a footnote to the passage in the 'Rat Man' case history referred to in footnote 1 above.]

4 [Another indication of Freud's concern with the problem of unconscious mental processes. Cf. footnote 1, p. 50 above.]

with the following remarks which are intended more or less figuratively. There are two forms of obsessional neurosis, according to whether what forces an entrance into consciousness is solely the *mnemic content* of the act involving self-reproach, or whether the self-reproachful *affect* connected with the act does so as well.

The first form includes the typical obsessional ideas, in which the content engages the patient's attention and, as an affect, he merely feels an indefinite unpleasure [*Unlust*], whereas the only affect which would be suitable to the obsessional idea would be one of self-reproach. The content of the obsessional idea is distorted in two ways in relation to the obsessional act of childhood. First, something contemporary is put in the place of something past; and secondly, something sexual is replaced by something analogous to it that is not sexual. These two alterations are the effect of the inclination to repress, still in force, which we will ascribe to the 'ego'. The influence of the reactivated pathogenic memory is shown by the fact that the content of the obsessional idea is still in part identical with what has been repressed or follows from it by a logical train of thought. If, with the help of the psychoanalytic method, we reconstruct the origin of an individual obsessional idea, we find that from a single current impression two different trains of thought have
[171] been set going. The one which has passed by way of the repressed memory proves to be as correctly logical in its structure as the other, although it is incapable of being conscious and insusceptible to correction. If the products of the two psychical operations do not tally, what takes place is not some sort of logical adjustment of the contradiction between them; instead, alongside of the *normal* intellectual outcome, there comes into consciousness, as a compromise between the resistance [*Widerstande*] and the *pathological* intellectual product, an obsessional idea which appears absurd. If the two trains of thought lead to the *same* conclusion, they reinforce each other, so that an intellectual product that has been arrived at normally now behaves, psychologically, like an obsessional idea. *Wherever a neurotic obsession* [*Zwang*] *emerges in the psychical sphere, it comes from repression.* Obsessional ideas have, as it were, a compulsive [*Zwangs-*] psychical currency, not on account of their intrinsic value, but on account of the source from which they derive or which has added a contribution to their value.

A second form of obsessional neurosis comes about if what has forced its way to representation in conscious psychical life is not the repressed mnemic content but the likewise repressed self-reproach. The affect of self-reproach can, by means of some mental addition, be transformed

into any other unpleasurable affect. When this has happened there is no longer anything to prevent the substituted affect from becoming conscious. Thus *self-reproach* (for having carried out the sexual act in childhood) can easily turn into *shame* (in case someone else should find out about it), into *hypochondriacal anxiety* [*Angst*][T] (fear of the physical injuries resulting from the act involving the self-reproach), into *social anxiety* (fear of being punished by society for the misdeed), into *religious anxiety*, into *delusions of being noticed* (fear of betraying the act to other people), or into *fear of temptation* (a justified mistrust of one's own moral powers of resistance), and so on. In addition, the mnemic content of the act involving self-reproach may be represented in consciousness as well, or it may remain completely in the background – which makes diagnosis much more difficult. Many cases which, on a superficial examination, seem to be common (neurasthenic) hypochondria belong to this group of *obsessional affects*; what is known as 'periodic neurasthenia' or 'periodic melancholia' seems in particular to resolve itself with unexpected frequency into obsessional affects [172] and obsessional ideas – a discovery which is not a matter of indifference therapeutically.

Besides these compromise symptoms, which signify the return of the repressed and consequently a collapse of the defence that had been originally achieved, the obsessional neurosis constructs a set of further symptoms, whose origin is quite different. For the ego seeks to fend off the derivatives of the initially repressed memory, and in this defensive struggle it creates symptoms which might be classed together as '*secondary defence*'. These are all of them '*protective measures*', which have already done good service in the fight against obsessional ideas and obsessional affects. If these aids in the defensive struggle *genuinely* succeed in once more repressing the symptoms of the return [of the repressed] which have forced themselves on the ego, then the obsession is transferred to the protective measures themselves and creates a third form of 'obsessional neurosis' – *obsessional actions.* These actions are never primary; they never contain anything but a defence – never an aggression. A psychical analysis of them shows that, in spite of their peculiarity, they can always be fully explained by being traced back to the obsessional memories which they are fighting against.[1]

1 To take a single example only. An eleven-year-old boy had in an obsessional way instituted the following ceremonial before going to bed. He did not go to sleep until he had told his mother in the minutest detail all the experiences he had had during the day; there must be no bits of paper or other rubbish on the carpet in his bedroom in the evening; his bed had to be pushed right up against the wall, three chairs had to be placed in front of it, and the pillows had to lie in a particular

[173] Secondary defence against the obsessional ideas may be effected by a forcible diversion on to other thoughts with a content as contrary as possible. This is why *obsessional brooding*, if it succeeds, regularly deals with abstract and *suprasensual* things; because the ideas that have been repressed are always concerned with *sensuality*. Or else the patient tries to make himself master of each of his obsessional ideas singly by logical work and by having recourse to his conscious memories. This leads to *obsessional thinking*, to a *compulsion to test things* and to *doubting mania*. The advantage which perception has over memory in such tests at first causes the patient, and later compels him, to collect and store up all the objects with which he has come into contact. Secondary defence against obsessional *affects* leads to a still wider set of protective measures which are capable of being transformed into obsessional acts. These may be grouped according to their purpose: *penitential* measures (burdensome ceremonials, the observation of numbers), *precautionary* measures (all sorts of phobias, superstition, pedantry, increase of the primary symptom of conscientiousness); measures to do with *fear of betrayal* (collecting scraps of paper,[1] seclusiveness), or to ensure *numbing* [of the mind] (dipsomania). Among these obsessional acts and obsessional impulses, phobias, since they circumscribe the patient's existence, play the greatest part.

There are cases in which one can observe how the obsession is transferred [*überträgt*] from the idea or from the affect on to the protective measure; others in which the obsession oscillates periodically between the symptom of the return of the repressed and the symptom of the secondary defence; and yet other cases in which no obsessional idea is constructed at all, but, instead, the repressed memory is at once

way. In order to go to sleep he was obliged first to kick both his legs out a certain number of times and then lie on his side. This was explained in the following manner. Years before, a servant girl who put the nice-looking boy to bed had taken the opportunity of lying down on him and abusing him sexually. When, later on, this memory was aroused in him by a recent experience, it manifested itself in his consciousness in a compulsion [*Zwang*] to perform the ceremonial I have described above. The meaning of the ceremonial was easy to guess and was established point by point by psychoanalysis. The chairs were placed in front of the bed and the bed pushed against the wall in order that nobody else should be able to get at the bed; the pillows were arranged in a particular way so that they should be differently arranged from how they were on that evening; the movements with his legs were to kick away the person who was lying on him; sleeping on his side was because in the scene he had been lying on his back; his circumstantial confession to his mother was because, in obedience to a prohibition by his seductress, he had been silent to his mother about this and other sexual experiences; and, finally, the reason for his keeping his bedroom floor clean was that neglect to do so had been the chief reproach that he had so far had to hear from his mother. [A no less complicated sleep ceremonial was analysed by Freud twenty years later in Lecture XVII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 236 f.]

1 [An instance of this can be found in Case 10 in 'Obsessions and Phobias' (1895*c*), p. 71 above.]

represented by what is apparently a primary measure of defence. Here we reach at one bound the stage which elsewhere only completes the [174]
course run by the obsessional neurosis after the defensive struggle has taken place. Severe cases of this disorder end in the ceremonial actions becoming fixated [*Fixierung*][T], or in a general state of doubting mania, or in a life of eccentricity conditioned by phobias.

The fact that the obsessional ideas and everything derived from them meet with no belief [from the subject] is no doubt because at their first repression the defensive symptom of *conscientiousness* has been formed and that that symptom, too, acquires an obsessional force [*Zwangsgeltung*]. The subject's certainty of having lived a moral life throughout the whole period of his successful defence makes it impossible for him to believe the self-reproach which his obsessional idea involves. Only transitorily, too, on the appearance of a new obsessional idea and occasionally in melancholic states of exhaustion of the ego, do the pathological symptoms of the return of the repressed compel belief. The 'obsessional' character of the psychical formations [*Bildungen*] which I have described here has quite generally nothing to do with attaching belief to them. Nor is it to be confused with the factor which is described as the 'strength' or 'intensity' of an idea. Its essence is rather indissolubility by psychical activity that is capable of being conscious; and this attribute undergoes no change, whether the idea to which the obsession attaches is stronger or weaker, or less or more intensely 'illuminated', or 'cathected [*besetzt*][T] with energy' and so on. *Besetzung*

The cause of this invulnerability of the obsessional idea and its derivatives is, however, nothing more than its connection with the repressed memory from early childhood. For if we can succeed in making that connection conscious – and psychotherapeutic methods already appear able to do so – the obsession, too, is resolved.

III. ANALYSIS OF A CASE OF CHRONIC PARANOIA[1]

For a considerable time I have harboured a suspicion that paranoia, too – or classes of cases which fall under the heading of paranoia – is a psychosis of defence; that is to say, that, like hysteria and obsessions, it proceeds from the repression of distressing memories and that its symp- [175]
toms are determined in their form by the content of what has been repressed. Paranoia must, however, have a special method or mechanism

1 [*Footnote added* 1924:] More correctly, no doubt, *dementia paranoides*.

of repression[I] which is peculiar to it, in the same way as hysteria effects repression by the method of *conversion* into somatic innervation, and obsessional neurosis by the method of *substitution* (viz. by displacement [*Verschiebung*][T] along the lines of certain categories of associations). I had observed several cases which favoured this interpretation, but had found none which proved it; until, a few months ago, I had an opportunity, through the kindness of Dr Josef Breuer, of undertaking the psychoanalysis for therapeutic purposes of an intelligent woman of thirty-two, in whose case a diagnosis of chronic paranoia could not be questioned. I am reporting in these pages, without waiting further, some of the information I have been able to obtain from this piece of work, because I have no prospect of studying paranoia except in very isolated instances, and because I think it possible that my remarks may encourage a psychiatrist better placed than I am in this matter to give its rightful place to the factor of 'defence' in the discussion as to the nature and psychical mechanism of paranoia which is being carried on so actively just now. I have, of course, on the strength of the following single observation, no intention of saying more than: 'This case is a psychosis of defence and there are most probably others in the class of "paranoia" which are equally so.'

Frau P., thirty-two years of age, has been married for three years and is the mother of a child of two. Her parents were not neurotic; but her brother and sister are to my knowledge, like her, neurotic. It is doubtful whether she may not, at one time in her middle twenties, have become temporarily depressed and confused in her judgement. In recent years she was healthy and capable, until, six months after the birth of her child, she showed the first signs of her present illness. She became uncom-
[176] municative and distrustful, showed aversion to meeting her husband's brothers and sisters and complained that the neighbours in the small town in which she lived were behaving differently towards her from how they did before and were rude and inconsiderate to her. By degrees these complaints increased in intensity, although not in definiteness. She thought people had something against her, though she had no idea what; but there was no doubt that everyone – relatives and friends – had ceased to respect her and were doing all they could to slight her. She had racked her brains, she said, to find the reason for this, but had no idea. A little

1 [This passage offers a good example of Freud's changing use of the terms 'defence' and 'repression'. He would have used the word 'defence' instead of 'repression' after his discussion of the two terms in *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 144 f. But see also the Editors' Appendix A to that work (ibid., 153 f.).]

time later she complained that she was being watched and that people were reading her thoughts and knew everything that was going on in her house. One afternoon she suddenly had the idea that she was being watched while she was undressing in the evening. From that time on she took the most complicated[1] precautionary measures when she undressed; she got into bed in the dark and did not begin to take off her things till she was under the bedclothes. Since she avoided all contact with other people, ate poorly and was very depressed, she was sent in the summer of 1895 to a hydropathic establishment. There, fresh symptoms appeared and those she already had increased in strength. Already in the spring of that year, when she was alone one day with her housemaid, she had suddenly had a sensation in her lower abdomen, and thought to herself that the girl had at that moment had an improper idea. This sensation grew more frequent during the summer and became almost continual. She felt her genitals 'as one feels a heavy hand'. Then she began to see images which horrified her – hallucinations of naked women, especially of the lower part of a woman's abdomen with pubic hairs, and occasionally of male genitals as well. The image of the abdomen with hair and the physical sensation in her own abdomen usually occurred together. The images became very tormenting, for they happened regularly when she was in the company of a woman, and it made her think that she was seeing the woman in an indecent state of nakedness, but that simultaneously the woman was having the same picture of her (!). At the same time as these visual hallucinations – which vanished again for several months after their first appearance in the hydropathic establishment – she began to be pestered by voices which she did not recognize and which she could not account for. When she was in the street, they said: 'That's Frau P. – There she goes! Where's she going to?' Every one of her movements and actions was commented on; and at times she heard threats and reproaches. All these symptoms became worse when she was in company or in the street. For that reason she refused to go out; she said that eating disgusted her; and her state of health rapidly deteriorated. [177]

I gathered all this from her when she came to Vienna for treatment with me in the winter of 1895. I have set it out at length because I want to convey the impression that what we are dealing with here really is a quite frequent form of chronic paranoia – a conclusion with which the details of her symptoms and behaviour which I have still to describe will be found to tally. At that time she concealed from me the delusions which served to interpret her hallucinations, or else the delusions had in fact

1 [*komplizierten*. The word was accidentally omitted in the *SE*.]

not yet occurred to her. Her intelligence was undiminished; the only unusual thing I learnt was that she had repeatedly made appointments with her brother, who lived in the neighbourhood, in order to confide something important to him, but had never told him anything. She never spoke about her hallucinations, and towards the end she no longer said much either about the slights and persecutions to which she was subjected.

What I have to report about this patient concerns the aetiology of the case and the mechanism of the hallucinations. I discovered the aetiology when I applied Breuer's method, exactly as in a case of hysteria – in the first instance for the investigation and removal of the hallucinations. In doing so, I started out from the assumption that in this case of paranoia, just as in the two other defence neuroses with which I was familiar, there must be unconscious thoughts and repressed memories which could be brought into consciousness in the same way as they were in those neuroses, by overcoming a certain resistance. The patient at once confirmed my expectation, for she behaved in analysis exactly like, for instance, a hysterical patient; with her attention on the pressure of my hand,[1] she
[178] produced thoughts which she could not remember having had, which at first she did not understand and which were contrary to her expectations. The presence of significant unconscious ideas was thus demonstrated in a case of paranoia as well, and I was able to hope that I might trace the compulsion of paranoia, too, to repression. The only peculiarity was that the thoughts which arose from the unconscious were for the most part heard inwardly or hallucinated by the patient, in the same way as her voices.

Concerning the origin of the visual hallucinations, or at least of the vivid images, I learnt the following. The image of the lower part of a woman's abdomen almost always coincided with the physical sensation in her own abdomen; but the latter was much more constant and often occurred without the image. The first images of a woman's abdomen had appeared in the hydropathic establishment a few hours after she had in fact seen a number of naked women at the baths; so they turned out to be simple reproductions of a real impression. It was therefore to be presumed that these impressions had been repeated only because great interest was attached to them. She told me that she had felt ashamed for these women; she herself had been ashamed to be seen naked for as long as she could remember. Since I was obliged to regard the shame as

1 Cf. my *Studies on Hysteria*. [1895*d*. Freud had described this technique at several points in that work. See, for instance, *RSE*, **2**, 97–9 and 241 f.]

something obsessional, I concluded, in accordance with the mechanism of defence, that an experience must have been repressed here about which she had *not* felt ashamed. So I requested her to let the memories emerge which belonged to the theme of feeling ashamed. She promptly reproduced a series of scenes going back from her seventeenth to her eighth year, in which she had felt ashamed of being naked in her bath in front of her mother, her sister and the doctor; but the series ended in a scene at the age of six, in which she was undressing in the nursery before going to bed, without feeling any shame in front of her brother who was there. On my questioning her, it transpired that scenes like this had occurred often and that the brother and sister had for years been in the habit of showing themselves to one another naked before going to bed. I now understood the meaning of her sudden idea that she was being watched as she was going to bed. It was an unaltered piece of the old memory which involved self-reproach, and she was now making up for the shame which she had omitted to feel as a child.

My conjecture that we had to do with an affair between children, as is so often found in the aetiology of hysteria, was strengthened by the further progress of the analysis, which at the same time yielded solutions of individual details that frequently recurred in the clinical picture of the paranoia. The patient's depression began at the time of a quarrel between her husband and her brother, as a result of which the latter no longer came to the house. She had always been very fond of this brother and she missed him very much at that time. Besides this she spoke of a certain moment in her illness at which for the first time 'everything became clear to her' – that is, at which she became convinced of the truth of her suspicion that she was despised by everyone and deliberately slighted. This certainty came to her during a visit from her sister-in-law who, in the course of conversation, let fall the words: 'If anything of that sort happens to me, I treat it in a light vein.' At first Frau P. took this remark unsuspectingly; but later, after the visitor had left, it seemed to her that the words had contained a reproach, as if *she* was in the habit of taking serious things lightly; and from that moment on she was certain that she was the victim of general slander. When I questioned her as to what made her feel justified in applying the words to herself, she answered that it was the tone of voice in which her sister-in-law had spoken that had (although, it is true, only subsequently [*nachträglich*]) convinced her of it. This is a detail which is characteristic of paranoia. I now obliged her to remember what her sister-in-law had been saying *before* the remark she complained of, and it emerged that the sister-in-law had related how [179]

in her parents' home there had been all sorts of difficulties with her *brothers*, and had added the wise comment: 'In every family all sorts of things happen that one would like to draw a veil over. But if anything of the kind happens to *me*, I take it lightly.' Frau P. now had to admit that her depression was attached to the statements made by her sister-in-law *before* her last remark. Since she had repressed both the statements which might have awakened a memory of her relations with her brother, and had only retained the insignificant last one, it was with it that she was obliged to connect her feeling that her sister-in-law was making a reproach against her; and since its *content* offered no basis [*Anlehnung*]
[180] for this, she turned from the content to the *tone* in which the words had been spoken. This is probably a typical piece of evidence that the misinterpretations of paranoia are based on a repression.

My patient's singular conduct, too, in making appointments with her brother, and then having nothing to tell him, was solved in a surprising fashion. Her explanation was that she had thought that if she could only look at him he would be bound to understand her sufferings, since he knew the cause of them. Now, as this brother was in fact the only person who could know about the aetiology of her illness, it was clear that she had been acting in accordance with a motive which, although she herself did not understand it consciously, could be seen to be perfectly justified as soon as it was supplied with a meaning derived from the unconscious.

I then succeeded in getting her to reproduce the various scenes in which her sexual relationship with her brother (which had certainly lasted at least from her sixth to her tenth year) had culminated. During this work of reproduction, the physical sensation in her abdomen 'joined in the conversation'[1] as it were, as is regularly observed to happen in the analysis of hysterical mnemic residues. The image of the lower part of a woman's naked abdomen (but now reduced to childish proportions and without hair on it) appeared with the sensation or stayed away, according as the scene in question had occurred in full light or in the dark. Her disgust at eating, too, found an explanation in a repulsive detail of these proceedings. After we had gone through this series of scenes, the hallucinatory sensations and images had disappeared, and (up to the present, at any rate) they have not returned.[2]

1 [This phenomenon observed during psychoanalyses had been discussed and explained by Freud in his technical contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 264–5.]

2 Later on, when an exacerbation of her illness undid the successful results of the treatment – which were in any case meagre – the patient no longer saw the offensive images of other people's genitals but had the idea that other people saw *her* genitals whenever they were *behind* her.

[The following addition appears in the 1924 edition of the English translation. It is not included in any of the German editions, and no German text is extant. It is therefore printed here without alteration. The note is dated 1922.]

I had found, therefore, that these hallucinations were nothing else [181]
than parts of the content of repressed childhood experiences, symptoms of the return of the repressed.

I now turned to the analysis of the voices. First and foremost what had to be explained was why such an indifferent content as 'Here comes Frau P.', 'she's looking for a house now', and so on, could have been so distressing to her; next, how it was that precisely these innocent phrases had managed to be marked out by hallucinatory reinforcement. From the first it was clear that the 'voices' could not be *memories* that were being produced in a hallucinatory way, like the images and sensations, but were rather *thoughts* that were being 'said aloud'.

The first time she heard the voices was in the following circumstances. She had been reading Otto Ludwig's fine story, *Die Heiterethei*,[1] with eager interest, and she noticed that while she was reading, thoughts were emerging which claimed her attention. Immediately afterwards, she went for a walk along a country road, and, as she was passing a small peasant's house, the voices suddenly said to her 'That's what the Heiterethei's cottage looked like! There's the spring and there are the bushes! How happy she was in spite of all her poverty!' The voices then repeated to her whole paragraphs from what she had just been reading. But it [182]
remained unintelligible why the Heiterethei's cottage and bushes and spring, and precisely the most trivial and irrelevant passages of the story, should be forced on her attention with pathological strength. However, the solution to the puzzle was not difficult. Her analysis showed that while she was reading, she had had other thoughts as well and that she had been excited by quite different passages in the book. Against this material – analogies between the couple in the story and herself and her husband, memories of intimacies in her married life, and of family secrets – against all this a repressing resistance had arisen because it was

The fragmentary account of this analysis in the text above was written while the patient was still undergoing treatment. Very shortly after, her condition became so much more serious that the treatment had to be broken off. She was transferred to an institution and there went through a period of severe hallucinations which had all the signs of dementia praecox. [An editorial comment in the English translation of 1924 explains that the original German footnote applied to this period.] Contrary to expectation, however, she recovered and returned home, had another child which was quite healthy, and was able for a long period (12 to 15 years) to carry out all her duties in a satisfactory manner. The only sign of her earlier psychosis was said to be that she avoided the company of all relatives, whether of her own family or of her husband's. At the end of this period, affected by very adverse changes in her circumstances, she again became ill. Her husband had become unable to work and the relatives she had avoided were obliged to support the family. She was again sent to an institution, and died there soon after, of a pneumonia which rapidly supervened.

1 [Otto Ludwig (1813–65) was a very well-known German dramatist and novelist. *Die Heiterethei und ihr Widerspiel* (1854) was a novel the heroine of which was a Thuringian peasant girl. Freud referred back to this episode in his paper on 'Screen Memories' (1899*a*), p. 299 below.]

connected, by easily demonstrable trains of thought, with her aversion to sexuality and thus ultimately went back to the awakening of her old childhood experience. In consequence of this censorship[1] exercised by the repression, the innocuous and idyllic passages, which were connected with the proscribed ones by contrast and also by propinquity, acquired the additional strength in their relation to consciousness which made it possible for them to be spoken aloud. The first of the repressed ideas, for instance, related to the slander to which the heroine, who lived alone, was exposed from her neighbours. My patient easily discovered the analogy with her own self. She, too, lived in a small place, met no-one, and thought she was despised by her neighbours. This distrust of her neighbours had a real foundation. She had been obliged at first to be content with a small apartment, and the bedroom wall against which the young couple's double bed stood adjoined a room belonging to their neighbours. With the beginning of her marriage – obviously through an unconscious awakening of her childhood affair, in which she and her brother had played at husband and wife – she had developed a great aversion to sexuality. She was constantly worried in case her neighbours might hear words and noises through the party wall, and this shame turned into suspiciousness towards the neighbours.

Thus the voices owed their origin to the repression of thoughts which, in the last analysis, were in fact self-reproaches about experiences that were analogous to her childhood trauma. The voices were accordingly symptoms of the return of the repressed. But they were at the same time
[183] consequences of a compromise between the resistance of the ego and the power of the returning repressed – a compromise which in this instance had brought about a distortion that went beyond recognition. In other instances in which I had occasion to analyse Frau P.'s voices, the distortion was less great. Nevertheless, the words she heard always had a quality of diplomatic indefiniteness: the insulting allusion was generally deeply hidden; the connection between the separate sentences was disguised by a strange mode of expression, unusual forms of speech and so on – characteristics which are common to the auditory hallucinations of paranoiacs in general and in which I see the traces of distortion through compromise. For instance, the remark 'there goes Frau P.; she's looking for a house in the street' meant a threat that she would never recover; for I had promised her that after her treatment she would be able to go back to the small town in which her husband worked. (She had provisionally taken rooms in Vienna for a few months.)

1 [Cf. *Studies on Hysteria* (1895*d*), *RSE*, **2**, 239 f. and 251.]

In isolated instances Frau P. also received more definite threats – for example, in regard to her husband's relatives; yet there was still a contrast between the reserved manner in which they were expressed and the torment which the voices caused her. In view of what is known of paranoia apart from this, I am inclined to suppose that there is a gradual impairment of the resistances which weaken the self-reproaches; so that finally the defence fails altogether and the original self-reproach, the actual term of abuse, from which the subject was trying to spare himself, returns in its unaltered form. I do not know, however, whether this course of events is a constant one, or whether the censorship of the words involving the self-reproach may be absent from the beginning or may persist to the end.

It only remains for me now to employ what has been learnt from this case of paranoia for making a comparison between paranoia and obsessional neurosis. In each of them, repression has been shown to be the nucleus of the psychical mechanism, and in each what has been repressed is a sexual experience in childhood. In this case of paranoia, too, every obsession sprang from repression; the symptoms of paranoia allow of a classification similar to the one which has proved justified for obsessional neurosis. Part of the symptoms, once again, arise from primary defence [184]
– namely, all the delusional ideas which are characterized by distrust and suspicion and which are concerned with ideas of being persecuted by others. In obsessional neurosis the initial self-reproach has been repressed by the formation of the primary symptom of defence: *self-distrust*. With this, the self-reproach is acknowledged as justified; and, to weigh against this, the conscientiousness which the subject has acquired during his healthy interval now protects him from giving credence to the self-reproaches which return in the form of obsessional ideas. In paranoia, the self-reproach is repressed in a manner which may be described as *projection* [*Projektion*].[1] It is repressed by erecting the defensive symptom of *distrust of other people*. In this way the subject withdraws his acknowledgement of the self-reproach; and, as if to make up for this, he is deprived of a protection against the self-reproaches which return in his delusional ideas.

1 [This seems to be the first published use made by Freud of this technical term. It occurs in his earlier study of paranoia which was sent to Fliess on January 24, 1895 (Freud, 1950*a*, Draft H; *RSE*, **1**, 234 ff.), and which examines the concept more fully than the present passage. The term is also used in a broader (though not unrelated) sense in Freud's (1895*b*) anxiety neurosis paper, p. 100 above. See also Freud (1893*c*), *RSE*, **1**, 187 ff.]

Other symptoms of my case of paranoia are to be described as symptoms of the return of the repressed, and they, too, like those of obsessional neurosis, bear the traces of the compromise which alone allows them to enter consciousness. Such are, for instance, my patient's delusional idea of being watched while she was undressing, her visual hallucinations, her hallucinations of sensation and her hearing of voices. In the delusional idea which I have just mentioned there is a mnemic content which is almost unaltered and has only been made indefinite through omission. The return of the repressed in visual images approaches the character of hysteria rather than of obsessional neurosis; but hysteria is in the habit of repeating its mnemic symbols without modification, whereas mnemic hallucinations in paranoia undergo a distortion similar to that in obsessional neurosis: an analogous modern image takes the place of the repressed one. (E.g. the abdomen of an adult woman appears instead of a child's, and an abdomen on which the hairs are especially distinct, because they were absent in the original impression.) A thing which is quite peculiar to paranoia and on which no further light can be shed by
[185] this comparison is that the repressed self-reproaches return in the form of thoughts spoken aloud. In the course of this process, they are obliged to submit to twofold distortion: they are subjected to a censorship, which leads to their being replaced by other, associated, thoughts or to their being concealed by an indefinite mode of expression, and they are referred to recent experiences which are no more than analogous to the old ones.

The third group of symptoms that are found in obsessional neurosis, the symptoms of secondary defence, cannot be present as such in paranoia, because no defence can avail against the returning symptoms[1] to which, as we know, belief is attached. In place of this, we find in paranoia another source for the formation of symptoms [*Symptombildung*]. The delusional ideas which have arrived in consciousness by means of a compromise (the symptoms of the return [of the repressed]) make demands on the thought activity of the ego until they can be accepted without contradiction. Since they are not themselves open to influence, the ego must adapt itself to them; and thus what corresponds here to the symptoms of secondary defence in obsessional neurosis is a combinatory delusional formation[2] – *interpretative delusions* which end in an

1 [I.e. the symptoms of the return of the repressed.]

2 [I.e. one which attempts to bring the different parts of the material into harmony with each other. In Draft K (see above, p. 170 *n.* 1) Freud used the term 'assimilatory delusions'.]

alteration of the ego.[I] In this respect, the case under discussion was not complete; at that time my patient did not as yet exhibit any signs of the attempts at interpretation which appeared later. But I have no doubt that if we apply psychoanalysis to this stage of paranoia as well, we shall be able to arrive at a further important result. It should then turn out that the so-called *weakness of memory* of paranoiacs is also a tendentious one – that is to say, that it is based on repression and serves the ends of repression. A subsequent [*nachträglich*][T] repression and replacement takes place of memories which are not in the least pathogenic, but which are in contradiction to the alteration of the ego which the symptoms of the return of the repressed so insistently demand.

1 [See the Editors' Note, p. 170 f. above.]

THE AETIOLOGY OF HYSTERIA

(1896)

Plate with the street number, Berggasse 19

Docent Dr. Sigm. Freud

beehrt sich anzuzeigen, dass er von Mitte September 1891 an

IX. Berggasse 19,

wohnen und daselbst von 5–7 Uhr (auch 8–9 Uhr Früh) ordiniren wird.

Included (No. XXXVI) in Freud's own collection of abstracts of his early works (1897*b*). The present translation is a revised and corrected reprint of the *SE* version.

According to a footnote in the *Wiener klinische Rundschau* of May 31, 1896, this paper is based on a lecture delivered by Freud before the Verein für Psychiatrie und Neurologie on May 2. This date is, however, incorrect. In a letter to Fliess of Thursday, April 16, Freud wrote that on the following Tuesday [April 21] he was due to give a lecture before the Psychiatrischer Verein. He does not specify the topic, but in another letter, dated April 26 and 28, 1896, he reported having given a lecture before that Society on the aetiology of hysteria. He went on to remark that 'the donkeys gave it an icy reception' and that Krafft-Ebing, who was in the chair, said it sounded like a scientific fairy tale. In yet another letter, dated May 30 (Freud, 1950*a*, Letter 46), he wrote: 'In defiance of my colleagues, I have written out my lecture on the aetiology of hysteria in full for Paschkis' (the editor of the *Rundschau*). And its [190] publication in fact started in that paper on the next day. Strachey (*SE*, **3**, 190) concluded on this basis that the lecture was given on April 21, 1896, but subsequent research has revealed that it was actually given on April 25, 1896.

The present work may be regarded as an amplified repetition of the first section of its predecessor, the second paper on the neuropsychoses of defence (1896*b*). Freud's

findings on the causes of hysteria are given in fuller detail, with some account of the difficulties he had to overcome in reaching them. Much more space is given, especially in the last part of the paper, to the sexual experiences in childhood which Freud believed to lie behind the later symptoms. As in the previous papers, these experiences are regarded as invariably actual seductions: the realization of the existence of infantile sexuality still lay in the future. There is nevertheless a hint (on pp. 219–20 below) of what was to be described in the *Three Essays* (1905*d*), *RSE*, **7**, 169, as the 'polymorphously perverse' character of infantile sexuality. Among other points of interest, we may note an increasing tendency to prefer psychological to neurological explanations (p. 210 below), and an early attempt at solving the problem of 'choice of neurosis' (pp. 223–4), which was to be a constantly returning subject of discussion. Freud's varying views on this are traced in the Editors' Note to 'The Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**, 309 ff.; the subject had in fact been approached already in the two papers preceding the present one (pp. 164 f. and 178 f. above).

THE AETIOLOGY OF HYSTERIA

[I]

Gentlemen, when we set out to form an opinion about the causation of a [191]
pathological state such as hysteria, we begin by adopting the method of anamnestic investigation: we question the patient or those about him in order to find out to what harmful influences they themselves attribute his having fallen ill and developed these neurotic symptoms. What we discover in this way is, of course, falsified by all the factors which commonly hide the knowledge of his own state from a patient – by his lack of scientific understanding of aetiological influences, by the fallacy of *post hoc, propter hoc*, by his reluctance to think about or mention certain noxae and traumas. Thus in making an anamnestic investigation of this sort, we keep to the principle of not adopting the patients' belief without a thorough critical examination, of not allowing them to lay down our scientific opinion for us on the aetiology of the neurosis. Although we do, on the one hand, acknowledge the truth of certain constantly repeated assertions, such as that the hysterical state is a long-persisting after-effect of an emotion experienced in the past, we have, on the other hand, introduced into the aetiology of hysteria a factor which the patient himself never brings forward and whose validity he only reluctantly admits – namely, the hereditary disposition derived from his progenitors. As you know, in the view of the influential school of Charcot heredity alone deserves to be recognized as the true cause of hysteria, while all other noxae of the most various nature and intensity only play the part of incidental causes, of '*agents provocateurs*'.

You will readily admit that it would be a good thing to have a second method of arriving at the aetiology of hysteria, one in which we should feel less dependent on the assertions of the patients themselves. A dermatologist, for instance, is able to recognize a sore as luetic from the character of its margins, of the crust on it and of its shape, without being misled by the protestations of his patient, who denies [*leugnet*] any [192]

source of infection for it; and a forensic physician can arrive at the cause of an injury, even if he has to do without any information from the injured person. In hysteria, too, there exists a similar possibility of penetrating from the symptoms to a knowledge of their causes. But in order to explain the relationship between the method which we have to employ for this purpose and the older method of anamnestic enquiry, I should like to bring before you an analogy taken from an advance that has in fact been made in another field of work.

Imagine that an explorer arrives in a little-known region where his interest is aroused by an expanse of ruins, with remains of walls, fragments of columns, and tablets with half-effaced and unreadable inscriptions. He may content himself with inspecting what lies exposed to view, with questioning the inhabitants – perhaps semi-barbaric people – who live in the vicinity, about what tradition tells them of the history and meaning of these archaeological remains, and with noting down what they tell him – and he may then proceed on his journey. But he may act differently. He may have brought picks, shovels and spades with him, and he may set the inhabitants to work with these implements. Together with them he may start upon the ruins, clear away the rubbish, and, beginning from the visible remains, uncover what is buried. If his work is crowned with success, the discoveries are self-explanatory: the ruined walls are part of the ramparts of a palace or a treasure house; the fragments of columns can be filled out into a temple; the numerous inscriptions, which, by good luck, may be bilingual, reveal an alphabet and a language, and, when they have been deciphered and translated, yield undreamt-of information about the events of the remote past, to commemorate which the monuments were built. *Saxa loquuntur!*[1]

If we try, in an approximately similar way, to induce the symptoms of a hysteria to make themselves heard as witnesses to the history of the origin of the illness, we must take our start from Josef Breuer's momentous discovery: *the symptoms of hysteria* (apart from the stigmata[2]) *are*
[193] *determined by certain experiences of the patient's which have operated in a traumatic fashion and which are being reproduced in his psychical life in the form of mnemic symbols.*[3] What we have to do is to apply Breuer's method – or one which is essentially the same – so as to lead the patient's attention back from his symptom to the scene in which and through

1 ['Stones talk!']

2 [These, defined by Charcot (1887, 255) as 'the permanent symptoms of hysteria', had been described by Freud as non-psychogenic in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 236. They had also been discussed by Breuer, ibid., **2**, 218. (See also ibid., **2**, 14.) In a very early letter to Breuer of June 29, 1892, Freud (1941*a*) had described the origin of these symptoms as 'highly obscure'.]

3 [See footnote 4, above, p. 46.]

which that symptom arose; and, having thus located the scene, we remove the symptom by bringing about, during the reproduction of the traumatic scene, a subsequent [*nachträgliche*][T] correction of the psychical course of events which took place at the time. *Nachträglichkeit*

It is not part of my intention today to discuss the difficult technique of this therapeutic procedure or the psychological discoveries which have been obtained by its means. I have been obliged to start from this point only because the analyses conducted on Breuer's lines seem at the same time to open up the path to the causes of hysteria. If we subject a fairly large number of symptoms in a great number of subjects to such an analysis, we shall, of course, arrive at a knowledge of a correspondingly large number of traumatically operative scenes. It was in these experiences that the efficient causes of hysteria came into action. Hence we may hope to discover from the study of these traumatic scenes what the influences are which produce hysterical symptoms and in what way they do so.

This expectation proves true; and it cannot fail to, since Breuer's theses, when put to the test in a considerable number of cases, have turned out to be correct. But the path from the symptoms of hysteria to its aetiology is more laborious and leads through other connections than one would have imagined.

For let us be clear on this point. Tracing a hysterical symptom back to a traumatic scene assists our understanding only if the scene satisfies two conditions; if it possesses the relevant *suitability to serve as a determinant* and if it recognizably possesses the necessary *traumatic force* [*Kraft*][T]. Instead of a verbal explanation, here is an example. Let us suppose that the symptom under consideration is hysterical vomiting; in that case we shall feel that we have been able to understand its causation [194]
(except for a certain residue) if the analysis traces the symptom back to an experience which *justifiably produced a high amount of disgust* – for instance, the sight of a decomposing dead body. But if, instead of this, the analysis shows us that the vomiting arose from a great fright [*Schreck*], e.g. from a railway accident, we shall feel dissatisfied and will have to ask ourselves how it is that the fright has led to the particular symptom of vomiting. This derivation lacks *suitability as a determinant*. We shall have another instance of an insufficient explanation if the vomiting is supposed to have arisen from, let us say, eating a fruit which had partly gone bad. Here, it is true, the vomiting *is* determined by disgust, but we cannot understand how, in this instance, the disgust could have become so powerful as to be perpetuated in a hysterical symptom; the experience lacks *traumatic force*.

Let us now consider how far the traumatic scenes of hysteria which are uncovered by analysis fulfil, in a fairly large number of symptoms and cases, the two requirements which I have named. Here we meet with our first great disappointment. It is true, indeed, that the traumatic scene in which the symptom originated does in fact occasionally possess both the qualities – suitability as a determinant and traumatic force – which we require for an understanding of the symptom. But far more frequently, incomparably more frequently, we find one of the three other possibilities realized, which are so unfavourable to an understanding. Either the scene to which we are led by analysis and in which the symptom first appeared seems to us unsuited for determining the symptom, in that its content bears no relation to the nature of the symptom; or the allegedly traumatic experience, though it *does* have a relation to the symptom, proves to be an impression which is normally innocuous and incapable as a rule of producing any effect; or, lastly, the 'traumatic scene' leaves us in the lurch in both respects, appearing at once innocuous and unrelated to the character of the hysterical symptom.

(Here I may remark in passing that Breuer's view [*Auffassung*][T] of the origin of hysterical symptoms is not shaken by the discovery of traumatic scenes which correspond to experiences that are insignificant in themselves. For Breuer assumed – following Charcot – that even an innocuous
[195] experience can be heightened into a trauma and can develop determining force if it happens to the subject when he is in a special psychical condition – in what is described as a *hypnoid state*.[1] I find, however, that there are often no grounds whatever for presupposing the presence of such hypnoid states. What remains decisive is that the theory of hypnoid states contributes nothing to the solution of the other difficulties, namely that the traumatic scenes so often lack suitability as determinants.)

Moreover, gentlemen, this first disappointment we meet with in following Breuer's method is immediately succeeded by another, and one that must be especially painful to us as physicians. When our procedure leads, as in the cases described above, to findings which are insufficient as an explanation both in respect to their suitability as determinants and to their traumatic effectiveness, we also fail to secure any therapeutic gain; the patient retains his symptoms unaltered, in spite of the initial result yielded by the analysis. You can understand how great the temptation is at this point to proceed no further with what is in any case a laborious piece of work.

1 [See p. 44 above.]

But perhaps all we need is a new idea [*Einfalles*][T] in order to help us out of our dilemma and lead to valuable results. The idea is this. As we know from Breuer, hysterical symptoms can be resolved if, starting from them, we are able to find the path back to the memory of a traumatic experience. If the memory which we have uncovered does not answer our expectations, it may be that we ought to pursue the same path a little further; perhaps behind the first traumatic scene there may be concealed the memory of a second, which satisfies our requirements better and whose reproduction has a greater therapeutic effect; so that the scene that was first discovered only has the significance of a connecting link in the chain of associations [*Assoziationsverkettung*]. And perhaps this situation may repeat itself; inoperative scenes may be interpolated more than once, as necessary transitions in the process of reproduction, until we finally make our way from the hysterical symptom to the scene which is really operative traumatically and which is satisfactory in every respect, both therapeutically and analytically. Well, gentlemen, this supposition is correct. If the first discovered scene is unsatisfactory, we tell our patient that this experience explains nothing, but that behind it there must be [196] hidden a more significant, earlier, experience; and we direct his attention by the same technique to the associative thread which connects the two memories – the one that has been discovered and the one that has still to be discovered.[1] A continuation of the analysis then leads in every instance to the reproduction of new scenes of the character we expect. For example, let us take once again the case of hysterical vomiting which I selected before, and in which the analysis first led back to a fright from a railway accident – a scene which lacked suitability as a determinant. Further analysis showed that this accident had aroused in the patient the memory of another, earlier accident, which, it is true, he had not himself experienced but which had been the occasion of his having a ghastly and revolting sight of a dead body. It is as though the combined operation of the two scenes made the fulfilment of our postulates possible, the one experience supplying, through fright, the traumatic force and the other, from its content, the determining effect. The other case, in which the vomiting was traced back to eating an apple which had partly gone bad, was amplified by the analysis somewhat in the following way. The bad apple reminded the patient of an earlier experience: while he was

Einfall

1 I purposely leave out of this discussion the question of what the category is to which the association between the two memories belongs (whether it is an association by simultaneity, or by causal connection, or by similarity of content), and of what psychological character is to be attributed to the various 'memories' (conscious or unconscious).

picking up windfalls in an orchard he had accidentally come upon a dead animal in a revolting state.

I shall not return any further to these examples, for I have to confess that they are not derived from any case in my experience but are inventions of mine. Most probably, too, they are bad inventions. I even regard such solutions of hysterical symptoms as impossible. But I was obliged to make up fictitious examples for several reasons, one of which I can state at once. The real examples are all incomparably more complicated: to relate a single one of them in detail would occupy the whole period of this lecture. The chain of associations always has more than two links; and the traumatic scenes do not form a simple row, like a string of pearls, but ramify and are interconnected like genealogical trees, so that in any
[197] new experience two or more earlier ones come into operation as memories. In short, giving an account of the resolution of a single symptom would in fact amount to the task of relating an entire case history.

But we must not fail to lay special emphasis on one conclusion to which analytic work along these chains of memory has unexpectedly led. We have learnt that *no hysterical symptom can arise from a real*[1] *experience alone, but that in every case the memory of earlier experiences awakened in association with it plays a part in causing the symptom.* If – as I believe – this proposition holds good *without exception*, it furthermore shows us the basis on which a psychological theory of hysteria must be built.

You might suppose that the rare instances in which analysis is able to trace the symptom back direct to a traumatic scene that is thoroughly suitable as a determinant and possesses traumatic force, and is able, by thus tracing it back, at the same time to remove it (in the way described in Breuer's case history of Anna O.[2]) – you might suppose that such instances must, after all, constitute powerful objections to the general validity of the proposition I have just put forward. It certainly looks so. But I must assure you that I have the best grounds for assuming that even in such instances there exists a chain of operative memories which stretches far back behind the first [reported] traumatic scene, *even though* the reproduction of the latter alone may have the result of removing the symptom.

It seems to me really astonishing that hysterical symptoms can only arise with the cooperation of memories, especially when we reflect that,

1 [*realen*. The meaning is 'actual' (in the sense of 'current') as opposed to 'remembered'. Cf. p. 218 below.]

2 [See p. 29 above.]

according to the unanimous accounts of the patients themselves, these memories did not come into their consciousness at the moment when the symptom first made its appearance. Here is much food for thought; but these problems must not distract us at this point from our discussion of the aetiology of hysteria.[1] We must rather ask ourselves: where shall we get to if we follow the chains of associated memories which the analysis has uncovered? How far do they extend? Do they come anywhere to a natural end? Do they perhaps lead to experiences which are in some way alike, either in their content or the time of life at which they occur, [198] so that we may discern in these universally similar factors the aetiology of hysteria of which we are in search?

The knowledge I have so far gained already enables me to answer these questions. If we take a case which presents several symptoms, we arrive by means of the analysis, starting from each symptom, at a series of experiences the memories of which are linked together in association. To begin with, the chains of memories lead backwards separately from one another; but, as I have said, they ramify. From a single scene two or more memories are reached at the same time, and from these again side-chains proceed whose individual links may once more be associatively connected with links belonging to the main chain. Indeed, a comparison with the genealogical tree of a family whose members have also intermarried is not at all a bad one. Other complications in the linkage of the chains arise from the circumstance that a single scene may be called up several times in the same chain, so that it has multiple relationships to a later scene, and exhibits both a direct connection with it and a connection established through intermediate links. In short, the concatenation is far from being a simple one; and the fact that the scenes are uncovered in a reversed chronological order (a fact which justifies our comparison of the work with the excavation of a stratified ruined site) certainly contributes nothing to a more rapid understanding of what has taken place.

If the analysis is carried further, new complications arise. The associative chains belonging to the different symptoms begin to enter into relation with one another; the genealogical trees become intertwined. Thus a particular symptom in, for instance, the chain of memories relating to the symptom of vomiting calls up not only the earlier links in its own chain but also a memory from another chain, relating to another symptom, such as a headache. This experience accordingly belongs to

1 [Freud takes up the postponed problem below, on p. 217 ff. He had already touched on it in a footnote to Section I of his second paper on the neuropsychoses of defence (1896*b*), p. 177 *n.* 1 above.]

both series, and in this way it constitutes a *nodal point* [*Knotenpunkt*].[1]
[199] Several such nodal points are to be found in every analysis. Their correlate in the clinical picture may perhaps be that from a certain time onwards both symptoms have appeared together, symbiotically, without in fact having any internal dependence on each other. Going still further back, we come upon nodal points of a different kind. Here the separate associative chains converge.[2] We find experiences from which two or more symptoms have proceeded; one chain has attached itself to one detail of the scene, the second chain to another detail.

But the most important finding that is arrived at if an analysis is thus consistently pursued is this. Whatever case and whatever symptom we take as our point of departure, *in the end we infallibly come to the field of sexual experience*. So here for the first time we seem to have discovered an aetiological precondition for hysterical symptoms.

From previous experience I can foresee that it is precisely against this assertion or against its universal validity that your contradiction, gentlemen, will be directed. Perhaps it would be better to say, your *inclination* to contradict; for none of you, no doubt, has as yet any investigations at your disposal which, based upon the same procedure, might have yielded a different result. As regards the controversial matter itself, I will only remark that the singling out of the sexual factor in the aetiology of hysteria springs at least from no preconceived opinion on my part. The two investigators as whose pupil I began my studies of hysteria, Charcot and Breuer, were far from having any such presupposition; in fact they had a personal disinclination to it which I originally shared. Only the most laborious and detailed investigations have converted me, and that slowly enough, to the view I hold today. If you submit my assertion that the aetiology of hysteria lies in sexual life to the strictest examination, you will find that it is supported by the fact that in some eighteen[3] cases of hysteria I have been able to discover this connection in every single symptom, and, where the circumstances allowed, to confirm
[200] it by therapeutic success. No doubt you may raise the objection that the nineteenth or the twentieth analysis will perhaps show that hysterical

1 ['Nodal points' had been described by Freud in his technical contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 258 and 263. It is worth comparing the account of the chains of associations given there (ibid., **2**, 256 ff.) with the present much shorter one. An actual instance of a 'nodal point' – the word 'wet' – is described in the analysis of the first dream in the 'Dora' case history (1905*e*), ibid., **7**, 79 ff.]

2 [The regular occurrence first of divergence and then of convergence in chains of associations is also mentioned by Freud as characteristic of dream analysis. Cf. Section II of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), ibid., **19**, 100.]

3 [Cf. the earlier figure of thirteen (pp. 161 and 174 above).]

symptoms are derived from other sources as well, and thus reduce the universal validity of the sexual aetiology to one of eighty per cent. By all means let us wait and see; but, since these eighteen cases are at the same time *all* the cases on which I have been able to carry out the work of analysis and since they were not picked out by anyone for my convenience, you will find it understandable that I do not share such an expectation but am prepared to let my belief run ahead of the evidential force of the observations I have so far made. Besides, I am influenced by another motive as well, which for the moment is of merely subjective value. In the sole attempt to explain the physiological and psychical mechanism of hysteria which I have been able to make in order to correlate my observations,[1] I have come to regard the participation of sexual driving forces[2] as an indispensable premise.

Eventually, then, after the chains of memories have converged, we come to the field of sexuality and to a small number of experiences which occur for the most part at the same period of life – namely, at puberty. It is in these experiences, it seems, that we are to look for the aetiology of hysteria, and through them that we are to learn to understand the origin of hysterical symptoms. But here we meet with a fresh disappointment and a very serious one. It is true that these experiences, which have been discovered with so much trouble and extracted out of all the mnemic material, and which seemed to be the ultimate traumatic experiences, have in common the two characteristics of being sexual and of occurring at puberty; but in every other respect they are very different from each other both in *kind* and in *importance*. In some cases, no doubt, we are concerned with experiences which must be regarded as severe traumas – an attempted rape, perhaps, which reveals to the immature girl at a blow all the brutality of sexual desire [*Geschlechtslust*][T], or the *Geschlecht*
involuntary witnessing of sexual acts between parents, which at one and the same time uncovers unsuspected ugliness and wounds childish and moral sensibilities alike, and so on. But in other cases the experiences are astonishingly trivial. In one of my women patients it turned out that her neurosis was based on the experience of a boy of her acquaintance stroking her hand tenderly and, at another time, pressing his knee against her [201]
dress as they sat side by side at table, while his expression let her see that he was doing something forbidden. For another young lady, simply

1 [The reference is obscure. It could be a rare acknowledgement of the 'Project' of 1895 (1950*a*; *RSE*, **1**, 205 ff.).]

2 [*Triebkräfte*. The term was invariably translated by James Strachey in the *SE* as 'motive forces'. The potential loss of meaning is well illustrated by the present instance. See *RSE*, **24**, 77 and 87.]

hearing a riddle which suggested an obscene answer had been enough to provoke the first anxiety attack and with it to start the illness. Such findings are clearly not favourable to an understanding of the causation of hysterical symptoms. If serious and trifling events alike, and if not only experiences affecting the subject's own body but visual impressions too and information received through the ears, are to be recognized as the ultimate traumas of hysteria, then we may be tempted to hazard the explanation that hysterics are peculiarly constituted creatures – probably on account of some hereditary disposition or degenerative atrophy – in whom a shrinking from sexuality, which normally plays some part at puberty, is raised to a pathological pitch and is permanently retained; that they are, as it were, people who are psychically inadequate to meeting the demands of sexuality. This view, of course, leaves hysteria in men out of account. But even without blatant objections such as that, we should scarcely be tempted to be satisfied with this solution. We are only too distinctly conscious of an intellectual sense of something half-understood, unclear and insufficient.

Luckily for our explanation, some of these sexual experiences at puberty exhibit a further inadequacy, which is calculated to stimulate us into continuing our analytic work. For it sometimes happens that they, too, lack suitability as determinants – although this is much more rarely so than with the traumatic scenes belonging to later life. Thus, for instance, let us take the two women patients whom I have just spoken of as cases in which the experiences at puberty were actually innocent ones. As a result of those experiences the patients had become subject to peculiar painful sensations in the genitals which had established themselves as the main symptoms of the neurosis. I was unable to find indications that they had been determined either by the scenes at puberty or by later scenes; but they were certainly not normal organic sensations nor signs of sexual excitement. It seemed an obvious thing, then, to say to ourselves that we must look for the determinants of these symptoms in yet
[202] other experiences, in experiences which went still further back – and that we must, for the second time, follow the saving notion which had earlier led us from the first traumatic scenes to the chains of memories behind them. In doing so, to be sure, we arrive at the period of earliest childhood, a period before the development of sexual life; and this would seem to involve the abandonment of a sexual aetiology. But have we not a right to assume that even the age of childhood is not wanting in slight sexual excitations [*Erregungen*][T], that later sexual development may perhaps be decisively influenced by childhood experiences? Injuries

sustained by an organ which is as yet immature, or by a function which is in process of developing, often cause more severe and lasting effects than they could do in maturer years.[1] Perhaps the abnormal reaction to sexual impressions which surprises us in hysterical subjects at the age of puberty is quite generally based on sexual experiences of this sort in childhood, in which case those experiences must be of a similar nature to one another, and must be of an important kind. If this is so, the prospect is opened up that what has hitherto had to be laid at the door of a still unexplained hereditary predisposition may be accounted for as having been acquired at an early age. And since infantile experiences with a sexual content could after all only exert a psychical effect through their *memory traces*, would not this view be a welcome amplification of the finding of psychoanalysis which tells us that *hysterical symptoms can only arise with the cooperation of memories*? [p. 204 above.]

II

You will no doubt have guessed, gentlemen, that I should not have carried this last line of thought so far if I had not wanted to prepare you for the idea that it is this line alone which, after so many delays, will lead us to our goal. For now we are really at the end of our wearisome and laborious analytic work, and here we find the fulfilment of all the claims and expectations upon which we have so far insisted. If we have the perseverance to press on with the analysis into early childhood, as far back as a human memory is capable of reaching, we invariably bring the patient to reproduce experiences which, on account both of their peculiar features and of their relations to the symptoms of his later illness, [203] must be regarded as the aetiology of his neurosis for which we have been looking. These *infantile* experiences are once more *sexual* in content, but they are of a far more uniform kind than the scenes at puberty that had been discovered earlier. It is now no longer a question of sexual topics having been aroused by some sense impression or other, but of sexual experiences affecting the subject's own body – of *sexual intercourse* (in the wider sense). You will admit that the *importance* of such scenes needs no further proof; to this may now be added that, in every instance, you will be able to discover in the details of the scenes the *determining* factors which you may have found lacking in the other scenes – the scenes which occurred later and were reproduced earlier. [Cf. p. 200 f. above.]

1 [In the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 319 *n*. 1, Freud links this principle with the embryological research of Wilhelm Roux.]

I therefore put forward the thesis that at the bottom of every case of hysteria there are *one or more occurrences of premature sexual experience*, occurrences which belong to the earliest years of childhood but which can be reproduced through the work of psychoanalysis in spite of the intervening decades.[1] I believe that this is an important finding, the discovery of a *caput Nili*[2] in neuropathology; but I hardly know what to take as a starting point for a continuation of my discussion of this subject. Shall I put before you the actual material I have obtained from my analyses? Or shall I rather try first to meet the mass of objections and doubts which, as I am surely correct in supposing, have now taken possession of your attention? I shall choose the latter course; perhaps we shall then be able to go over the facts more calmly.

(*a*) No-one who is altogether opposed to a psychological view of hysteria, who is unwilling to give up the hope that some day it will be possible to trace back its symptoms to 'finer anatomical changes' and who has rejected the view that the material foundations of hysterical changes are bound to be of the same kind as those of our normal mental processes – no-one who adopts this attitude will, of course, put any faith in the results of our analyses; however, the difference in principle between his premises and ours absolves us of the obligation of convincing him on individual points.

[204] But other people, too, although they may be less averse to psychological theories of hysteria, will be tempted, when considering our analytic findings, to ask what degree of certainty the application of psychoanalysis offers. Is it not very possible either that the physician forces such scenes upon his docile patients, alleging that they are memories, or else that the patients tell the physician things which they have deliberately invented or have imagined and that he accepts those things as true? Well, my answer to this is that the general doubt about the reliability of the psychoanalytic method can be appraised and removed only when a complete presentation of its technique and results is available. Doubts about the genuineness of the infantile sexual scenes can, however, be deprived of their force here and now by more than one argument. In the first place, the behaviour of patients while they are reproducing these infantile experiences is in every respect incompatible with the assumption that the scenes are anything else than a reality which is being felt with distress and reproduced with the greatest reluctance. Before they

1 [*Footnote added* 1924:] Cf. my remark below.

2 [Source of the Nile.]

come for analysis the patients know nothing about these scenes. They are indignant as a rule if we warn them that such scenes are going to emerge. Only the strongest compulsion of the treatment can induce them to embark on a reproduction of them. While they are recalling these infantile experiences to consciousness, they suffer under the most violent sensations, of which they are ashamed and which they try to conceal; and, even after they have gone through them once more in such a convincing manner, they still attempt to withhold belief from them, by emphasizing the fact that, unlike what happens in the case of other forgotten material, they have no feeling of remembering the scenes.[1]

This latter piece of behaviour seems to provide conclusive proof. Why should patients assure me so emphatically of their unbelief, if what they want to discredit is something which – from whatever motive – they themselves have invented?

It is less easy to refute the idea that the doctor forces reminiscences of this sort on the patient, that he influences him by suggestion to imagine [205]
and reproduce them. Nevertheless, it appears to me equally untenable. I have never yet succeeded in forcing on a patient a scene I was expecting to find, in such a way that he seemed to be living through it with all the appropriate feelings. Perhaps others may be more successful in this.

There are, however, a whole number of other things that vouch for the reality of infantile sexual scenes. In the first place there is the uniformity which they exhibit in certain details, which is a necessary consequence if the preconditions of these experiences are always of the same kind, but which would otherwise lead us to believe that there were secret understandings between the various patients. In the second place, patients sometimes describe as harmless events whose significance they obviously do not understand, since they would be bound otherwise to be horrified by them. Or again, they mention details, without laying any stress on them, which only someone of experience in life can understand and appreciate as subtle traits of reality.

Events of this sort strengthen our impression that the patients must really have experienced what they reproduce under the compulsion of analysis as scenes from their childhood. But another and stronger proof of this is furnished by the relationship of the infantile scenes to the content of the whole of the rest of the case history. It is exactly like putting together a child's picture-puzzle: after many attempts, we become

1 [*Footnote added* 1924:] All this is true; but it must be remembered that at the time I wrote it I had not yet freed myself from my *overvaluation* of reality and my *low valuation* of phantasy. [Cf. the additional footnote to the previous paper, p. 178 above.]

absolutely certain in the end which piece belongs in the empty gap; for only that one piece fills out the picture and at the same time allows its irregular edges to be fitted into the edges of the other pieces in such a manner as to leave no free space and to entail no overlapping.[1] In the same way, the contents of the infantile scenes turn out to be indispensable supplements to the associative and logical framework [*Gefüge*][T] of the neurosis, whose insertion makes its course of development for the first time evident, or even, as we might often say, self-evident.

[206] Without wishing to lay special stress on the point, I will add that in a number of cases therapeutic evidence of the genuineness of the infantile scenes can also be brought forward. There are cases in which a complete or partial cure can be obtained without our having to go as deep as the infantile experiences. And there are others in which no success at all is obtained until the analysis has come to its natural end with the uncovering of the earliest traumas. In the former cases we are not, I believe, secure against relapses; and my expectation is that a complete psychoanalysis implies a radical cure of the hysteria.[2] We must not, however, be led into forestalling the lessons of observation.

There would be one other proof, and a really unassailable one, of the genuineness of childhood sexual experiences – namely, if the statements of someone who is being analysed were to be confirmed by someone else, whether under treatment or not. These two people will have had to have taken part in the same experience in their childhood – perhaps to have stood in some sexual relationship to each other. Such relations between children are, as you will hear in a moment [p. 214 below], by no means rare. Moreover, it quite often happens that both of those concerned subsequently fall ill of neuroses; yet I regard it as a fortunate accident that, out of eighteen cases, I have been able to obtain an objective confirmation of this sort in two. In one instance, it was the brother (who had remained well) who of his own accord confirmed – not, it is true, his earliest sexual experiences with his sister (who was the patient) – but at least scenes of that kind from later childhood, and the fact that there had been sexual relations dating further back. In the other instance, it happened that two women whom I was treating had as children had sexual relations with the same man, in the course of which certain scenes had taken place *à trois*. A particular symptom, which was derived from

1 [This analogy was used by Freud again more than a quarter of a century later, in a period when 'jigsaw' puzzles had become an adult pastime. See 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**, 105.]

2 [It is of interest to compare this with the less sanguine views expressed by Freud in his very late paper 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 195 ff.]

these childhood events, had developed in both women, as evidence of what they had experienced in common.

(*b*) Sexual experiences in childhood consisting in stimulation of the genitals, coitus-like acts, and so on, must therefore be recognized, in the last [207]
analysis, as being the traumas which lead to a hysterical reaction to events at puberty and to the development of hysterical symptoms. This statement is certain to be met from different directions with two mutually contradictory objections. Some people will say that sexual abuses of this kind, whether practised upon children or between them, happen too seldom for it to be possible to regard them as the determinant of such a common neurosis as hysteria. Others will perhaps argue that, on the contrary, such experiences are very frequent – much too frequent for us to be able to attribute an aetiological significance to the fact of their occurrence. They will further maintain that it is easy, by making a few enquiries, to find people who remember scenes of sexual seduction and sexual abuse in their childhood years, and yet who have never been hysterical. Finally we shall be told, as a weighty argument, that in the lower strata of the population hysteria is certainly no more common than in the highest ones, whereas everything goes to show that the injunction for the sexual safeguarding of childhood is far more frequently transgressed in the case of the children of the proletariat.

Let us begin our defence with the easier part of the task. It seems to me certain that our children are far more often exposed to sexual assaults than the few precautions taken by parents in this connection would lead us to expect. When I first made enquiries about what was known on the subject, I learnt from colleagues that there are several publications by paediatricians which stigmatize the frequency of sexual practices by nurses and nursery maids, carried out even on infants in arms; and in the last few weeks I have come across a discussion of 'Coitus in Childhood' by Dr Stekel (1895)[1] in Vienna. I have not had time to collect other published evidence; but even if it were only scanty, it is to be expected that increased attention to the subject will very soon confirm the great frequency of sexual experiences and sexual activity in childhood.

Lastly, the findings of my analysis are in a position to speak for themselves. In all eighteen cases (cases of pure hysteria and of hysteria combined with obsessions, and comprising six men and twelve women) [208]
I have, as I have said, come to learn of sexual experiences of this kind in

1 [This date is wrongly given as '1896' in the (pre-1971) German editions. Incidentally, Stekel only came to hear of Freud some five years after this. Cf. Jones, 1955, 8.]

childhood. I can divide my cases into three groups, according to the origin of the sexual stimulation. In the first group it is a question of assaults – of single, or at any rate isolated, instances of abuse, mostly practised on female children, by adults who were strangers, and who, incidentally, knew how to avoid inflicting gross, mechanical injury. In these assaults there was no question of the child's consent, and the first effect of the experience was preponderantly one of fright. The second group consists of the much more numerous cases in which some adult looking after the child – a nursery maid or governess or tutor, or, unhappily all too often, a close relative[1] – has initiated the child into sexual intercourse and has maintained a regular love relationship with it – a love relationship, moreover, with its mental side developed – which has often lasted for years. The third group, finally, contains child relationships proper – sexual relations between two children of different sexes, mostly a brother and sister, which are often prolonged beyond puberty and which have the most far-reaching consequences for the pair. In most of my cases I found that two or more of these aetiologies were in operation together; in a few instances the accumulation of sexual experiences coming from different quarters was truly amazing. You will easily understand this peculiar feature of my observations, however, when you consider that the patients I was treating were all cases of severe neurotic illness which threatened to make life impossible.

Where there had been a relation between two children I was sometimes able to prove that the boy – who, here too, played the part of the aggressor – had previously been seduced by an adult of the female sex, and that afterwards, under the pressure of his prematurely awakened libido and compelled by his memory, he tried to repeat with the little girl exactly the same practices that he had learnt from the adult woman, without making any modification of his own in the character of the sexual activity.

In view of this, I am inclined to suppose that children cannot find their way to acts of sexual aggression unless they have been seduced previously. The foundation for a neurosis would accordingly always be laid [209] in childhood by adults, and the children themselves would transfer to one another the disposition to fall ill of hysteria later. I will ask you to consider a moment longer the special frequency with which sexual relations in childhood occur precisely between brothers and sisters and cousins, as a result of their opportunities for being together so often; supposing, then, ten or fifteen years later several members of the younger

1 [Cf. an Editors' footnote to the previous paper, p. 175 above.]

generation of the family are found to be ill, might not this appearance of a family neurosis naturally lead to the false supposition that a hereditary disposition is present where there is only a *pseudoheredity* and where in fact what has taken place is a handing on [*Übertragung*], an infection in childhood?

Now let us turn to the other objection [p. 213 above], which is based precisely on an acknowledgement of the frequency of infantile sexual experiences and on the observed fact that many people who remember scenes of that kind have *not* become hysterics. Our first reply is that the excessive frequency of an aetiological factor cannot possibly be used as an objection to its aetiological significance.[1] Is not the tubercle bacillus ubiquitous and is it not inhaled by far more people than are found to fall ill of tuberculosis? And is its aetiological significance impaired by the fact that other factors must obviously be at work too before the tuberculosis, which is its specific effect, can be evoked? In order to establish the bacillus as the specific aetiology it is enough to show that tuberculosis cannot possibly occur without its playing a part. The same doubtless applies to our problem. It does not matter if many people experience infantile sexual scenes without becoming hysterics, provided only that all the people who become hysterics have experienced scenes of that kind. The area of occurrence of an aetiological factor may be freely allowed to be wider than that of its effect, but it must not be narrower. Not everyone who touches or comes near a smallpox patient develops smallpox; nevertheless infection from a smallpox patient is almost the only known aetiology of the disease.

It is true that if infantile sexual activity were an almost universal occurrence the demonstration of its presence in every case would carry no weight. But, to begin with, to assert such a thing would certainly be a gross exaggeration; and secondly, the aetiological pretensions of the infantile scenes rest not only on the regularity of their appearance in the anamneses of hysterics, but, above all, on the evidence of there being associative and logical ties between those scenes and the hysterical symptoms – evidence which, if you were given the complete history of a case, would be as clear as daylight to you. [210]

What can the other factors be which the 'specific aetiology' of hysteria still needs in order actually to produce the neurosis? That, gentlemen, is a theme in itself, which I do not propose to enter upon. Today I need only indicate the point of contact at which the two parts of the

1 [The whole question of 'specific aetiology' had been discussed by Freud more fully in his second paper on anxiety neurosis (1895*f*), p. 120 ff. above.]

topic – the specific and the auxiliary aetiology – fit into one another. No doubt a considerable quantity of factors will have to be taken into account. There will be the subject's inherited and personal constitution, the inherent importance of the infantile sexual experiences, and, above all, their number: a brief relationship with a strange boy, who afterwards becomes indifferent, will leave a less powerful effect on a girl than intimate sexual relations of several years' standing with her own brother. In the aetiology of the neuroses quantitative preconditions are as important as qualitative ones: there are threshold values which have to be crossed before the illness can become manifest. Moreover, I do not myself regard this aetiological series as complete; nor does it solve the riddle of why hysteria is not more common among the lower classes.[1] (You will remember, by the way, what a surprisingly large incidence of hysteria was reported by Charcot among working-class *men*.) I may also remind you that a few years ago I myself pointed out a factor, hitherto little considered, to which I attribute the leading role in provoking hysteria after puberty. I then[2] put forward the view that the outbreak of hysteria may almost invariably be traced to a *psychical conflict* arising through an incompatible idea [*Vorstellung*][T] setting in action a *defence* [*Abwehr*][T] on the part of the ego [*Ichs*][T] and calling up a demand for [211] repression [*Verdrängung*][T]. What the circumstances are in which a defensive endeavour of this kind has the pathological effect of actually thrusting the memory which is distressing to the ego into the unconscious and of creating a hysterical symptom in its place I was not able to say at that time. But today I can repair the omission. *The defence achieves its purpose of thrusting the incompatible idea out of consciousness if there are infantile sexual scenes present in the (hitherto normal) subject in the form of unconscious memories, and if the idea that is to be repressed can be brought into logical or associative connection with an infantile experience of that kind.*

Since the ego's efforts at defence depend upon the subject's total moral and intellectual development, the fact that hysteria is so much rarer in the lower classes than its specific aetiology would warrant is no longer entirely incomprehensible.

Let us return once again, gentlemen, to the last group of objections, the answering of which has led us such a long way. We have heard and have acknowledged that there are numerous people who have a very clear recollection of infantile sexual experiences and who nevertheless

1 [Cf. above, p. 213.]

2 [See Freud's first paper on the neuropsychoses of defence (1894*a*), p. 45 above.]

do not suffer from hysteria. This objection has no weight; but it provides an occasion for making a valuable comment. According to our understanding of the neurosis, people of this kind *ought* not to be hysterical at all, or at any rate, not hysterical as a result of the scenes which they consciously remember. With our patients, those memories are never conscious; but we cure them of their hysteria by transforming their unconscious memories of the infantile scenes into conscious ones. There was nothing that we could have done or needed to do about the fact that they have had such experiences. From this you will perceive that the matter is not merely one of the existence of the sexual experiences, but that a psychological precondition enters in as well. The scenes must be present as *unconscious memories*; only so long as, and insofar as, they are unconscious are they able to create and maintain hysterical symptoms. But what decides whether those experiences produce conscious or unconscious memories – whether that is conditioned by the content of the experiences, or by the time at which they occur, or by later influences – that is a fresh problem, which we shall prudently avoid. Let me merely remind you that, as its first conclusion, analysis has arrived at the proposition that *hysterical symptoms are derivatives of memories which are operating unconsciously*. [212]

(*c*) Our view then is that infantile sexual experiences are the fundamental precondition for hysteria, are, as it were, the *disposition* for it and that it is they which create the hysterical symptoms, but that they do not do so immediately, but remain without effect to begin with and only exercise a pathogenic action later, when they have been aroused after puberty in the form of unconscious memories. If we maintain this view, we shall have to come to terms with the numerous observations which show that a hysterical illness may already make its appearance in childhood and before puberty. This difficulty, however, is cleared up as soon as we examine more closely the data gathered from analyses concerning the chronology of the infantile experiences. We then learn that in our severe cases the formation [*Bildung*][T] of hysterical symptoms begins – not in exceptional instances, but, rather, as a regular thing – at the age of eight, and that the sexual experiences which show no immediate effect invariably date further back, into the third or fourth, or even the second year of life. Since in no single instance does the chain of effective experiences[1] break off at the age of eight, I must assume that this time of life,

1 [The sense would appear to suggest that this is a condensed way of saying 'experiences that might be expected to be effective'.]

the period of growth in which the second dentition takes place, forms a boundary line for hysteria, after which the illness cannot be caused. From then on, a person who has not had sexual experiences earlier can no longer become disposed to hysteria; and a person who *has* had experiences earlier is already able to develop hysterical symptoms. Isolated instances of the occurrence of hysteria on the other side of this boundary line (that is, *before* the age of eight) may be interpreted as a phenomenon of precocious maturity. The existence of this boundary line is very probably connected with developmental processes in the sexual system. Precocity of somatic sexual development may often be observed, and it is even possible that it can be promoted by too early sexual stimulation.[1]

[213] In this way we obtain an indication that a certain *infantile* state of the psychical functions, as well as of the sexual system, is required in order that a sexual experience occurring during this period shall later on, in the form of a memory, produce a pathogenic effect. I do not venture as yet, however, to make any more precise statement on the nature of this psychical infantilism or on its chronological limits.

(*d*) Another objection might arise from exception being taken to the supposition that the *memory* of infantile sexual experiences produces such an enormous pathogenic effect, while the actual experience itself has none. And it is true that we are not accustomed to the notion of powers emanating from a mnemic image which were absent from the real impression.[2] You will moreover notice the consistency with which the proposition that symptoms can only proceed from memories is carried through in hysteria. None of the later scenes, in which the symptoms arise, is the effective one; and the experiences which *are* effective have at first no result. But here we are faced with a problem which we may very justifiably keep separate from our theme. It is true that we feel impelled to make a synthesis, when we survey the number of striking conditions that we have come to know: the fact that in order to form a hysterical symptom a defensive effort against a distressing idea must be present, that this idea must exhibit a logical or associative connection with an unconscious memory through a few or many intermediate links, which themselves, too, remain unconscious at the moment, that this unconscious memory must have a sexual content, that its content must be an experience which occurred during a certain infantile period of life. It is

1 [Cf. the long footnote in Section I of the previous paper (1896*b*), p. 177 above.]

2 [Cf. Editors' footnote, p. 204 *n.* 1 above.]

true that we cannot help asking ourselves how it comes about that this memory of an experience that was innocuous at the time it happened should posthumously[1] produce the abnormal effect of leading a psychical process like defence to a pathological result, while it itself remains unconscious.

But we shall have to tell ourselves that this is a purely psychological problem, whose solution may perhaps necessitate certain hypotheses about normal psychical processes and about the part played in them by consciousness, but that this problem may be allowed to remain unsolved [214] for the time being, without detracting from the value of the insight we have so far gained into the aetiology of hysterical phenomena.[2]

III

Gentlemen, the problem, the approaches to which I have just formulated, concerns the *mechanism* of the formation of hysterical symptoms. We find ourselves obliged, however, to describe the *causation* of those symptoms without taking that mechanism into account, and this involves an inevitable loss of completeness and clarity in our discussion. Let us go back to the part played by the infantile sexual scenes. I am afraid that I may have misled you into overestimating their power to form symptoms. Let me, therefore, once more stress the fact that every case of hysteria exhibits symptoms which are determined not by infantile but by later, often by recent, experiences. Other symptoms, it is true, go back to the very earliest experiences and belong, so to speak, to the most ancient nobility. Among these latter are above all to be found the numerous and diverse sensations and paraesthesias of the genital organs and other parts of the body, these sensations and paraesthesias being phenomena which simply correspond to the sensory content of the infantile scenes, reproduced in a hallucinatory fashion, often painfully intensified.

Another set of exceedingly common hysterical phenomena – painful need to urinate, the sensation accompanying defaecation, intestinal disturbances, choking and vomiting, indigestion and disgust at food – were also shown in my analyses (and with surprising regularity) to be derivatives of the same childhood experiences and were explained without difficulty by certain invariable peculiarities of those experiences. For the idea of these infantile sexual scenes is very repellent to the

1 [Cf. p. 163 *n.* 1 above.]

2 [The psychological problem of 'deferred action' was considered in the previous paper (1896*b*), 177 *n.* 1 above.]

feelings of a sexually normal individual; they include all the abuses known to debauched and impotent persons, among whom the buccal cavity and the rectum are misused for sexual purposes. For physicians, astonishment at this soon gives way to a complete understanding. People who have no hesitation in satisfying their sexual desires upon children cannot be expected to jib at finer shades in the methods of
[215] obtaining that satisfaction; and the sexual impotence which is inherent in children inevitably forces them into the same substitutive actions as those to which adults descend if they become impotent. All the singular conditions under which the ill-matched pair conduct their love relations – on the one hand the adult, who cannot escape his share in the mutual dependence necessarily entailed by a sexual relationship, and who is yet armed with complete authority and the right to punish, and can exchange the one role for the other to the uninhibited satisfaction of his moods, and on the other hand the child, who in his helplessness is at the mercy of this arbitrary will, who is prematurely aroused to every kind of sensibility and exposed to every sort of disappointment, and whose performance of the sexual activities assigned to him is often interrupted by his imperfect control of his natural needs – all these grotesque and yet tragic incongruities reveal themselves as stamped upon the later development of the individual and of his neurosis, in countless permanent effects which deserve to be traced in the greatest detail. Where the relation is between two children, the character of the sexual scenes is nonetheless of the same repulsive sort, since every such relationship between children postulates a previous seduction of one of them by an adult. The psychical consequences of these child relations are quite extraordinarily far-reaching; the two individuals remain linked by an invisible bond throughout the whole of their lives.

Sometimes it is the accidental circumstances of these infantile sexual scenes which in later years acquire a determining power [*Macht*][T] over the symptoms of the neurosis. Thus, in one of my cases the circumstance that the child was required to stimulate the genitals of adults [*der Erwachsenen*][1] with his [*seinem*][t] foot was enough to fixate his neurotic attention for years on to his legs and to their function, and finally to produce a hysterical paraplegia. In another case, a woman patient suffering from anxiety attacks which tended to come on at certain hours of the day could not be calmed unless a particular one of her many sisters stayed by her side all the time. Why this was so would have remained a riddle if analysis had not shown that the man who had committed the

1 [Mistranslated as 'a grown-up woman' in *SE*.]

assaults on her used to enquire at every visit whether this sister, whom he was afraid might interrupt him, was at home.

It may happen that the determining power of the infantile scenes is so much concealed that, in a superficial analysis, it is bound to be overlooked. In such instances we imagine that we have found the explanation of some particular symptom in the content of one of the later scenes – until, in the course of our work, we come upon the same content in one of the *infantile* scenes, so that in the end we are obliged to recognize that, after all, the later scene only owes its power of determining symptoms to its agreement with the earlier one. I do not wish because of this to represent the later scene as being unimportant; if it was my task to put before you the rules that govern the formation of hysterical symptoms, I should have to include as one of them that the idea which is selected for the production of a symptom is one which has been called up by a combination of several factors and which has been aroused from various directions simultaneously. I have elsewhere tried to express this in the formula: *hysterical symptoms are overdetermined* [*überdeterminiert*][T.1] [216]

Überdeterminierung

One thing more, gentlemen. It is true that earlier [p. 219 above] I put the relation between recent and infantile aetiology aside as a separate theme. Nevertheless, I cannot leave the subject without overstepping this resolution at least with one remark. You will agree with me that there is *one* fact above all which leads us astray in the psychological understanding of hysterical phenomena, and which seems to warn us against measuring psychical acts in hysterics and in normal people with the same yardstick. That fact is the discrepancy between psychically exciting stimuli and psychical reactions which we come upon in hysterical subjects. We try to account for it by assuming the presence in them of a general abnormal sensitivity to stimuli, and we often endeavour to explain it on a physiological basis, as if in such patients certain organs of the brain which serve to transmit stimuli were in a peculiar chemical state (like the spinal centres of a frog, perhaps, which has been injected with strychnine) or as if these cerebral organs had withdrawn from the influence of higher inhibiting centres (as in animals being experimented on under vivisection). Occasionally one or other of these concepts [*Auffassungen*][T] may be perfectly valid as an explanation of hysterical phenomena; I do not dispute this. But the main part of the phenomenon – of the abnormal, exaggerated, hysterical reaction to psychical stimuli – admits of another explanation, an explanation which is [217]

1 [See Freud's technical contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 234 and 258.]

supported by countless examples from the analyses of patients. And this is as follows: *The reaction of hysterics is only apparently exaggerated; it is bound to appear exaggerated to us because we only know a small part of the motives* [*Motive*][T] *from which it arises*.

In reality, this reaction is proportionate to the exciting stimulus; thus it is normal and psychologically understandable. We see this at once when the analysis has added to the manifest motives, of which the patient is conscious, those other motives, which have been operative without his knowing about them, so that he could not tell us of them.

I could spend hours demonstrating the validity of this important assertion for the whole range of psychical activity in hysteria, but I must confine myself here to a few examples. You will remember the mental 'sensitiveness' which is so frequent among hysterical patients and which leads them to react to the least sign of being depreciated as though they had received a deadly insult. What would you think, now, if you were to observe this high degree of readiness to feel hurt on the slightest occasion, if you came across it between two normal people, a husband and wife, perhaps? You would certainly infer that the conjugal scene you had witnessed was not solely the result of this latest trifling occasion, but that inflammable material had been piling up for a long time and that the whole heap of it had been set alight by the final provocation.

I would ask you to carry this line of thought over on to hysterical patients. It is not the latest slight – which, in itself, is minimal – that produces the fit of crying, the outburst of despair or the attempt at suicide, in disregard of the axiom that an effect must be proportionate to its cause; the small slight of the present moment has aroused and set working the memories of very many, more intense, earlier slights, behind all of which there lies in addition the memory of a serious slight in childhood which has never been overcome. Or again, let us take the instance of a young girl who blames herself most frightfully for having allowed a boy to stroke her hand in secret, and who from that time on has been overtaken by a neurosis. You can, of course, answer the puzzle by pro-
[218] nouncing her an abnormal, eccentrically disposed and oversensitive person; but you will think differently when analysis shows you that the touching of her hand reminded her of another, similar touching, which had happened very early in her childhood and which formed part of a less innocent whole, so that her self-reproaches were actually reproaches about that old occasion. Finally, the problem of the hysterogenic points[1]

1 [The term used by Charcot, e.g. 1887, 85 ff., is 'hysterogenic zones'; but the present word appears also in Freud's contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 232.]

is of the same kind. If you touch a particular spot, you do something you did not intend: you awaken a memory which may start off a convulsive attack, and since you know nothing of this psychical intermediate link you refer the attack directly to the operation of your touch. The patients are in the same state of ignorance and therefore fall into similar errors. They constantly establish 'false connections'[1] between the most recent cause, which they are conscious of, and the effect, which depends on so many intermediate links. If, however, the physician has been able to bring together the conscious and unconscious motives for the purpose of explaining a hysterical reaction, he is almost always obliged to recognize that the seemingly exaggerated reaction is appropriate and is abnormal only in its form.

You may, however, rightly object to this justification of the hysterical reaction to psychical stimuli and say that nevertheless the reaction is not a normal one. For why do healthy people behave differently? Why do not all *their* excitations of long ago come into operation once more when a new, present-day, excitation takes place? One has an impression, indeed, that with hysterical patients it is as if all their old experiences – to which they have already reacted so often and, moreover, so violently – had retained their effective power; as if such people were incapable of disposing of their psychical stimuli. Quite true, gentlemen, something of the sort must really be assumed. You must not forget that in hysterical people when there is a present-day precipitating cause, the old experiences come into operation in the form of *unconscious memories*. It looks as though the difficulty of disposing of a present impression, the impossibility of transforming it into a powerless memory, is attached precisely to the character of the psychical unconscious.[2] You see that the remainder of the problem lies once more in the field of psychology – and, what is more, a psychology of a kind for which philosophers have done little to prepare the way for us. [219]

To this psychology, which has yet to be created to meet our needs – to this future *psychology of the neuroses* – I must also refer you when, in conclusion, I tell you something which will at first make you afraid that it may disturb our dawning comprehension of the aetiology of hysteria. For I must affirm that the aetiological role of infantile sexual experience is not confined to hysteria but holds good equally for the remarkable neurosis of obsessions [*Zwangsvorstellungen*], and perhaps also, indeed,

1 [See Section II of the first paper on the neuropsychoses of defence (1894*a*), p. 48 f. above.]

2 [This is an early hint of Freud's later view of the 'timelessness' of the unconscious. See Section V of the metapsychological paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 165 *n*. 3.]

for the various forms of chronic paranoia and other functional psychoses. I express myself on this with less definiteness, because I have as yet analysed far fewer cases of obsessional neurosis than of hysteria; and as regards paranoia, I have at my disposal only a single full analysis and a few fragmentary ones.[1] But what I discovered in these cases seemed to be reliable and filled me with confident expectations for other cases. You will perhaps remember that already, at an earlier date,[2] I recommended that hysteria and obsessions should be grouped together under the name of '*neuroses of defence*', even before I had come to know of their common infantile aetiology. I must now add that – although this need not be expected to happen in general – every one of my cases of obsessions revealed a substratum of hysterical symptoms,[3] mostly sensations and pains, which went back precisely to the earliest childhood experiences. What, then, determines whether the infantile sexual scenes which have remained unconscious will later on, when the other pathogenic factors are superadded, give rise to hysterical or to obsessional neurosis or even to paranoia? This increase in our knowledge seems, as you see, to prejudice the aetiological value of these scenes, since it removes the specificity of the aetiological relation.

[220] I am not yet in a position, gentlemen, to give a reliable answer to this question. The number of cases I have analysed is not large enough nor have the determining factors in them been sufficiently various. So far, I have observed that obsessions can be regularly shown by analysis to be disguised and transformed *self-reproaches about acts of sexual aggression in childhood*, and are therefore more often met with in men than in women, and that men develop obsessions more often than hysteria. From this I might conclude that the character of the infantile scenes – whether they were experienced with pleasure or only passively – has a determining influence on the choice of the later neurosis; but I do not want to underestimate the significance of the age at which these childhood actions occur, and other factors as well. Only a discussion of further analyses can throw light on these points. But when it becomes clear which are the decisive factors in the choice between the possible forms of the neuropsychoses of defence, the question of what the mechanism is by virtue of which that particular form takes shape will once again be a purely psychological problem.

1 [Cf. the previous paper, 1896*b*.]

2 [I.e. in the first paper on the neuropsychoses of defence (1894*a*).]

3 [See p. 178 above.]

I have now come to the end of what I have to say today. Prepared as I am to meet with contradiction and disbelief, I should like to say one thing more in support of my position. Whatever you may think about the conclusions I have come to, I must ask you not to regard them as the fruit of idle speculation. They are based on a laborious individual examination of patients which has in most cases taken up a hundred or more hours of work. What is even more important to me than the value you put on my results is the attention you give to the procedure I have employed. This procedure is new and difficult to handle, but it is nevertheless irreplaceable for scientific and therapeutic purposes. You will realize, I am sure, that one cannot properly deny the findings which follow from this modification of Breuer's procedure so long as one puts it aside and uses only the customary method of questioning patients. To do so would be like trying to refute the findings of histological technique by relying upon macroscopic examination. The new method of research gives wide access to a new element in the psychical field of events, namely, to processes of thought which have remained unconscious – which, to use Breuer's expression, are 'inadmissible to consciousness'.[1] Thus it [221] inspires us with the hope of a new and better understanding of all functional psychical disturbances. I cannot believe that psychiatry will long hold back from making use of this new pathway to knowledge.

1 [See Part 5 of Breuer's theoretical contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 200 f.]

ABSTRACTS OF THE SCIENTIFIC WRITINGS OF DR SIGM. FREUD

ENGLISH TRANSLATION

'Abstracts of the Scientific Writings of Dr Sigm. Freud (1877–97)'

1962 *SE*, **3**, 227–57. (Tr. J. Strachey.)

This translation is a revised and corrected reprint of the *SE* version. It is also included in *NSW*, **4**.

Freud had been appointed a Privatdozent at the Vienna University in 1885. (This was a post comparable, not quite accurately, with a lectureship in an English university.) The next step would be an appointment as 'Professor Extraordinarius' (roughly equivalent to an Assistant Professor), but there were long delays over this, and it was twelve years later that Freud heard that his name was to be put forward to the Council of the Faculty by two very eminent men, Nothnagel and Krafft-Ebing. This is reported in a letter to Fliess of February 8, 1897 (Freud, 1950*a*, Letter 58).[1] The necessary preliminaries included a 'Curriculum Vitae' (ibid., Letter 59 of April 6), and a bibliographical abstract of publications, which is reprinted here. It had been finished before May 16 (ibid., Letter 62), and was evidently in print by May 25 (ibid., [226] Letter 63), when Freud sent a copy of it to Fliess, describing it, in a phrase borrowed from Leporello, as a 'List of all the beauties, etc. . . .' All these preparations were, however, in vain; for though the Council of the Faculty, by a majority vote, recommended the appointment, the higher ministerial consent was withheld, largely, no

1 The episode figured prominently in one of Freud's dreams reported in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 121 ff.

doubt, for anti-Semitic reasons. It was not for another five years, in 1902, that Freud was made a Professor.

It will be noticed, if a comparison is made with the complete bibliography in the last volume of this edition, that more than a few items have been omitted by Freud from the present list. These absentees are for the most part reviews, very minor papers and some unsigned contributions to collective works. Only a single work of any importance seems to have been overlooked – a lecture on cocaine (1885*b*), and it seems possible that unconscious factors had a share in the omission (Jones, 1953, 106).

The inclusion of these abstracts in the *Revised Standard Edition* offers a fortunate reminder to its readers that Freud's 'complete psychological works' are very far from coinciding with Freud's 'complete works', and that the first fifteen prolific years of his activity were concerned entirely with the physical sciences. It may be remarked that Freud himself was sometimes a little inclined to make rather contemptuous remarks about his neuroscientific writings, and some of these are quoted below. But other and more recent neuroscientists have been far from echoing Freud in this.

It will be noted that the order in which Freud arranges the items, though roughly chronological, is exactly so neither in respect of writing nor of publication.

We are greatly indebted to Dr Sabine Strich, of the Department of Neuropathology in the Institute of Psychiatry, University of London, for reading through these abstracts and advising on the translation of the neuroscientific material. The titles of several works have been changed for this edition to make them consistent with the *NSW* translations.

ABSTRACTS OF THE SCIENTIFIC WRITINGS OF DR SIGM. FREUD

A. *Before Appointment as Privatdozent*

I

'Observations on the configuration and finer structure of the lobulated organs of the eel described as testicles.' [1877*b*.][1]

[227] Dr Syrski had recently recognized a paired, lobulated, grooved organ occurring in the abdominal cavity of the eel as the animal's male sexual organ which had long been looked for. At Professor Claus's suggestion I investigated the occurrence and tissue components of these lobulated organs at the zoological station in Trieste.

II

'On the origin of the posterior nerve roots in the spinal cord of Ammocoetes[2] (Petromyzon planeri).' [1877*a*.][3]
(From the Institute of Physiology of the University of Vienna. With one plate.)

[228] Investigation of the spinal cord of Ammocoetes showed that the large nerve cells described by Reissner as occurring in the posterior grey matter (posterior cells) give rise to the root fibres of the posterior roots. – The anterior and posterior spinal roots of the Petromyzon, at all events in the caudal region, are displaced relatively to each other in their origins and remain distinct from each other in their peripheral course.

1 [This paper, included in *NSW*, **I**, was the report on Freud's first piece of scientific research, carried out while he was still a student at the University during two visits to Trieste in 1876, in the course of which he dissected some 400 eels. The present paper was in fact published three months after the following one (1877*a*, II) though written before it. Professor Claus was head of the Institute of Comparative Anatomy in Vienna.]

2 [The larval form of the brook lamprey.]

3 [This was Freud's first published work. The present paper and the following one (1878*a*, III), both included in *NSW*, **I**, were the outcome of a piece of research suggested to him by Brücke, head of the Institute of Physiology, to which Freud had been admitted in the autumn of 1876. – Some forty years later Freud summarized these two papers in Lecture XXII of his *Introductory Lectures* (1916–17*a*) in an attempt at finding an analogy for the psychological processes of fixation and regression.]

III

'On the spinal ganglia and spinal cord of Petromyzon.' [1878*a*.][1]
(From the Institute of Physiology of the University of Vienna.
With four plates and two woodcuts.)

The spinal ganglion cells of fish were long regarded as *bipolar* and those of the higher animals were considered to be *unipolar*. As regards the latter elements Ranvier had shown that their single process branched in a T-shape after a short course. – By the use of a gold maceration technique
[229] it was possible to make a complete survey of the spinal ganglia of Petromyzon; their nerve cells exhibit every transition between bipolarity and unipolarity with T-shaped branching of the fibres; the number of fibres of the posterior root is regularly greater than the number of nerve cells in the ganglion; thus there are 'fibres of passage' and 'anaclitic'
Anlehnung ['*angelehnte*'][T] nerve fibres, of which the latter merely mingle with the elements of the roots. – A link between the spinal ganglion cells and the posterior cells in the spinal cord which have been described [by Reissner, see II above] is provided in Petromyzon by cellular elements which are exposed on the surface of the spinal cord between the posterior root and ganglion. These scattered cells indicate the path taken by the spinal ganglion cells in the course of evolution. – In relation to the spinal cord of Petromyzon, the paper further describes the branching of the fibres in the central pathway of the posterior root fibres, and the forked ramification of the anterior commissural fibres, the intercalation of nerve cells in the spinal portions of the anterior roots, and a very fine nerve net (which can be stained by gold chloride) in the pia mater.

1 [This was a much more elaborate piece of work than its predecessor – eighty-six pages long, including an eighteen-page bibliography, compared with the thirteen pages of the earlier paper. In a letter to Freud of September 17, 1924, Abraham reports having picked up a second-hand copy of this work (1878*a*). Freud replies in a letter of September 21, 1924: 'It is making unreasonable demands of the unity of the personality to think that I should feel myself identical with the author of the work on the spinal ganglia of Petromyzon. And yet, all the same, it should be so, and I believe I was happier about that discovery than about others since.' (Freud, 1965*a*.)]

IV

'Note on a method for the anatomical preparation of the nervous system.' [1879*a*.][1]

A modification of a method recommended by Reichert. – A mixture of 1 part concentrated nitric acid, 3 parts water, and 1 part concentrated glycerine, since it destroys connective tissue and makes it easy to remove bones and muscles, is useful for laying bare the central nervous system with its peripheral branches, particularly in small mammals.

V

'On the structure of the nerve fibres and nerve cells of the river crayfish.' [1882*a*.]

The nerve fibres of the river crayfish, when the tissues are examined live, [230]
exhibit without exception a fibrillary structure. The nerve cells, whose survival can be recognized from the nucleoli in their nucleus, seem to be composed of two substances. One of these is reticular and is continued into the fibrils of the nerve fibres, and the other is homogeneous and is continued in their ground substance.

VI

'The structure of the elements of the nervous system.' [1884*f*.]
(Lecture delivered before the Psychiatric Society, 1882.)[2]

Contents as in V.

1 [Included in *NSW*, **1**.]

2 [There is some doubt as to the date of delivery of the lecture, but it seems highly probable that it was given on the occasion described in great detail by Freud to his fiancée in a letter written the same day, February 14, 1884 (Freud, 1960*a*). In that case the date of 1882 given by Freud must be a slip or misprint. In his letter, however, Freud speaks of the lecture as being based on one of his earlier works, which may well have been No. V above, actually written in 1882. Although Freud deals with its contents so cursorily, the lecture was of very great importance. It summarized Freud's researches on the histological structure of the nervous system (as reported in Nos. I, II, III and V above, all included in *NSW*, **1**) and was feeling its way towards the neuron theory, which was to be enunciated by Waldeyer in 1891. For all this see the first volume of Jones's biography (1953, 53–6) and see also Shepherd (1991).]

VII

'A new method for the study of the course of fibres in the central nervous system.' [1884*d*.][1]

[231] If fine sections of the central organ, hardened in chromate, are treated with gold chloride, a strong solution of soda and a 10% solution of calcium iodide, a red to blue stain is obtained which affects either the medullary sheaths or only the axis cylinders. The method is no more reliable than other methods of gold staining.

VII*a*

'A new histological method for the study of nerve-tracts in the brain and spinal chord.' [1884*c*.][2]

Contents as in VII.

VIII

'A case of brain haemorrhage with indirect basal focal symptoms in scurvy.' [1884*a*.][3]

[232] A report of a case of brain haemorrhage in a patient suffering from scurvy, which ran a rapid course under continuous observation. The symptoms are explained with reference to Wernicke's theory of the indirect effect of focal lesions.

1 [Freud had previously published a much shorter description of this method (1884*b*, not included in this list, but included with VII and VII*a* in *NSW*, **1**) under the same title in *Zbl. med. Wiss*. (1884*b*), which he finished writing on February 6, 1884. On the following day he completed the English translation of this shorter version (1884*c*, VII*a* below) with the help of an American, Bernard Sachs, who later became well known as a neurologist in New York. It was the first work by Freud to appear in English. The present, longer version (VII) was written later and not published till April.]

2 [This paper was in English. See footnote 1 above.]

3 [Included in *NSW*, **1**. A sixteen-year-old cobbler's apprentice was admitted to hospital on January 17, 1884, and died the next day. Freud's diagnosis was confirmed in every detail by the autopsy. He finished writing this report of the case on January 28. This and two other clinical studies published later (XII and XIII below) all date from 1884, while Freud was working under Franz Scholz in the department for nervous diseases in the Vienna General Hospital. They were no doubt written largely with a view to Freud's appointment as Privatdozent, which was made in September, 1885, just before he started on his visit to Paris.]

IX

'On Coca.' [1884*e*.][1]

The alkaloid of the coca plant which was described by Niemann [in 1860] received little attention for medical purposes at the time. My work included botanical and historical notes on the coca plant based on statements in the literature; it confirmed by experiments on normal subjects the remarkable stimulating effects of cocaine and its action in preventing hunger, thirst and sleep; and it endeavoured to lay down indications for the therapeutic use of the drug. [233]

Among these indications the reference to the possible employment of cocaine during withdrawal of morphine became of importance later. The expectation voiced at the end of the work that the property of cocaine for producing local anaesthesia would find further applications was soon afterwards fulfilled by K. Koller's experiments in anaesthetizing the cornea.

X

'Contribution to knowledge of the effects of cocaine.' [1885*a*.][2]

Dynamometric demonstration of the increase in motor strength during cocaine euphoria. Motor strength (measured by the strength of the grip) shows a regular daily oscillation (similar to that of body temperature). [234]

1 [Included in *NSW*, **1**. This monograph was completed by Freud on June 18, 1884, and published in July. An abridged English translation of it (1884*b*) appeared in December in the *St Louis Medical and Surgical Journal* (**47**, 502). In January, 1885, Freud published a paper (1885*a*, X below) on the effect of cocaine on muscular strength. In the middle of February the original monograph was reprinted, with some additions, in pamphlet form. Then came a lecture 'On the general effect of cocaine', delivered on March 5 at the Psychiatrischer Verein, and published on August 7 (1885*b*). This publication is not included in the present list; nor is 'Opinion on Parke's cocaine' (a comparison of an American preparation with the German one, Merck's, which Freud had been using earlier), which appeared in June (1885*e*). It was soon after this, in July, that criticisms of Freud's favourable attitude to the drug began to appear, especially from Erlenmeyer (1885, 1886 and 1887). Finally, in July, 1887, Freud published a reply to the criticisms (1887*d*, XVII below). A very full account of Freud's interest in cocaine is given by Ernest Jones in Chapter VI of the first volume of his biography (Jones, 1953).]

2 [Included in *NSW*, **1**. See footnote 1 above. The experiments reported here were begun by Freud in November, 1884.]

XI

'Concerning knowledge of the inter-olivary tract.' [1885*d*.][1]

Short notes on the connections of the roots of the auditory nerve and the connection between the inter-olivary tract and the decussated trapezoid body, based upon incompletely myelinated human preparations.

XII

'A case of muscular atrophy with widespread disturbances of sensibility (syringomyelia).' [1885*c*.][2]

[235] The combination of bilateral muscular atrophy, of bilateral disturbance of sensibility in the nature of a 'partial', dissociated paralysis of sensation, and of trophic disturbances in the left hand (which also exhibited the most intense anaesthesia), taken together with the restriction of the pathological symptoms to the upper part of the body, permitted a diagnosis *in vivo* in a 36-year-old man of syringomyelia, an affection which at that time was regarded as rare and hard to recognize.

1 [Included in *NSW*, **1**. This was completed on May 17, 1885. It is the first of three papers on the medulla oblongata (the others being XIV and XV below). The manuscript of this paper is dated 'Vienna, mid-May, 1885'. Freud commented on this early interest in the medulla oblongata in his *Autobiographical Study* (1925*d*), *RSE*, **20**, 8. Again, in Lecture XXV of his *Introductory Lectures* (1916–17*a*), speaking of the light thrown by academic medicine on the problem of anxiety, he wrote: 'Interest there seems mainly to be centred on tracing the anatomical paths along which the state of anxiety is brought about. We are told that the medulla oblongata is stimulated, and the patient learns that he is suffering from a neurosis of the vagus nerve. The medulla oblongata is a very serious and lovely object. I remember quite clearly how much time and trouble I devoted to its study many years ago. Today, however, I must remark that I know nothing that could be of less interest to me for the psychological understanding of anxiety than a knowledge of the path of the nerves along which its excitations pass.' (Ibid., **16**, 347.)]

2 [Included in *NSW*, **1**. The patient was a weaver who was under Freud's observation and treatment for six weeks from November 10, 1884, and was then discharged from hospital. Cf. footnote 3, p. 234 above.]

B. *After Appointment as Privatdozent*

XIII

'Acute multiple neuritis of the spinal and cranial nerves.' [1886*a*.][1]

An eighteen-year-old man fell ill without fever but with general symptoms [236]
and dragging pains in his chest and legs. At first he showed symptoms of endocarditis, but later the pains increased and sensitiveness to pressure developed in the vertebral column and regionally in the skin, muscles and nerve trunks as the affection involved one extremity after the other: heightening of the reflexes, outbreaks of sweating, local wasting, and lastly diplopia, disturbances of swallowing, facial paresis, and hoarseness. Finally fever, extreme acceleration of the pulse and pulmonary affection. The diagnosis of acute multiple neuritis made during the course of the illness was confirmed by the post-mortem findings, which showed that all the spinal nerves in their sheaths were injected, greyish-red, and, as it were, bunched up. Similar changes in the cranial nerves. Endocarditis. – According to the pathologist [Kundrat],[2] this was the first post-mortem finding of polyneuritis to be made in Vienna.

XIV

'On the relation of the restiform body to the posterior column and its nucleus with some remarks on two fields of the oblongata.' [1886*b*.][3]
Jointly with Dr L. Darkschewitsch (Moscow).

By studying preparations with incompletely myelinated medulla the [237]
restiform body can be divided into two components: a 'nucleus' (primary restiform body) and a 'fringe' (secondary restiform body). The latter contains the olivary fibre system which becomes medullated later. The primary restiform body, which is medullated earlier, is divided into

1 [Included in *NSW*, **1**. The patient, a baker, was under Freud's observation from October 3, 1884, until his death on December 17. Cf. footnote 3, p. 234 above. Freud refers to this successful diagnosis in his *Autobiographical Study* (1925*d*), *RSE*, **20**, 9.]

2 [Hans Kundrat (1845–93), Professor of Pathological Anatomy in Vienna.]

3 [Included in *NSW*, **1**. This was the second of the group of three anatomical papers mentioned above, p. 236 *n*. 1. The manuscript is dated 'Paris, January 23, 1886'. His collaborator was a Russian neurologist whom he had known two years earlier in Vienna and met again in Paris. We are told that in fact he was responsible only for the drawings which accompanied Freud's text. He later became well known in Russia. (It may be remarked that his writings are usually indexed in England under the spelling 'Darkshevich'.)]

a 'head portion' and a 'tail portion'. The head of the primary restiform body arises from the nucleus of the column of Burdach and thus represents a (for the most part undecussated) continuation to the cerebellum of the centripetal tract from the extremities. The corresponding continuation to the cerebrum is provided by means of the arcuate fibres originating from this same nucleus. The tail portion of the primary restiform body is a direct continuation of the spinal lateral cerebellar tract. – The lateral field of the medulla oblongata allows of a uniform interpretation [*Auffassung*][T] of its components. It contains four grey substances with the systems of fibres proceeding from them, which are to be considered homologous to one another as substances in which the sensory nerves from the extremities, and the trigeminal, vagal, and auditory nerves have their origin.

XV

'On the origin of the nervus acusticus.' [1886*c*.][1]

[238] A description of the origin of the auditory nerve, based on preparations of the human foetus, illustrated by four drawings of cross-sections and a diagram. The auditory nerve falls into three portions, of which the lowest (most spinal) terminates in the auditory ganglion and has continuations through the cornu trapezoides and the tracts of the superior olivary body; the second can be traced as the 'ascending' auditory root of Roller into what is known as Deiters' nucleus; and the third runs into the inner auditory field of the medulla oblongata, from which continuations into the cerebellum arise. Details are given of the further course of these tracts so far as it has been possible to follow them.

1 [Included in *NSW*, **1.** The third of the series of papers mentioned on p. 236 *n*. 1 above.]

XVI

'Observation of a severe case of hemianaesthesia in a hysterical male.' [1886*d*.][1]
(The organ of vision was examined by Dr Königstein.)

The case history of a 29-year-old engraver with a bad family history, who fell ill after a dispute with his brother. The case afforded a demonstration of the symptom of sensible and sensorial hemianaesthesia in its classical form. – The disturbance in the field of vision and in the sense of colour is reported by Dr Königstein.

XVII

'Remarks on Addiction to and Fear of Cocaine.' [1887*d*.][2]
(With reference to a lecture by W. A. Hammond.)

The employment of cocaine for the relief of abstinence from morphine [239]
resulted in the misuse of cocaine and gave physicians an opportunity of observing the new clinical picture of chronic cocaine addiction. My essay, supported by a pronouncement from an American neuropathologist, seeks to show that this addiction to cocaine comes about only in addicts to other drugs (such as morphine) and that cocaine itself cannot be blamed for it.

XVIII

'On hemianopia in earliest childhood.' [1888*a*.][3]

An observation of disturbance in one half of the visual field in two children, aged 26 months and three and a quarter years, an age at which the

1 [*RSE*, **1**, 25 ff.; *NSW*, **1**. On October 15, 1886, not long after his return from Paris, Freud had read a paper before the Vienna 'Gesellschaft der Ärzte' on male hysteria, of which the full text has not survived. It was received with something like derision, and Freud was challenged to produce a case of male hysteria in Vienna. The present lecture before the same Society was the result: the case was demonstrated by him and his friend Königstein, the ophthalmic surgeon, on November 26, 1886. We have here the first published indication of the shift in Freud's field of interest since his contact with Charcot.

It may be remarked that the paper was headed 'Contributions to the Clinical Study of Hysteria, No. 1'; but the series was never continued further.]

2 [Included in *NSW*, **1**. This is Freud's last paper on the subject of cocaine; see above, p. 235 *n*. 1.]

3 [Included in *NSW*, **1**. This was the first of a series of studies on the cerebral palsies of children, which was to include three works of considerable size. (Cf. below Nos. XX, XXV, XXVI, XXVII and XXXVIII.) From 1886, after his return to Vienna from Paris, Freud was attached for several

symptom had not previously been medically recorded. A discussion on the lateral inclination of the head and eyes which was to be observed in one of the cases and on the localization of the suspected lesion. Both cases are to be classed among the 'unilateral cerebral palsies of children'.

XIX

Conceptualizing the Aphasias: A Critical Study. [1891*b*.][1]

[240] After a firm basis for the understanding of cerebral disturbances of language had been established by the discovery and definite localization of a motor and a sensory aphasia (Broca and Wernicke), the authorities set about tracing the more subtle symptoms of aphasia as well to factors of localization. In this way they arrived at the hypothesis of a *conduction* aphasia, along with subcortical and transcortical, and motor and sensory forms. This critical study is directed against this view of language disorders and it seeks to introduce for their explanation functional factors in place of the topographical ones. The forms described as subcortical and transcortical are not to be explained by a particular localization of the lesion but by conditions of reduced capacity for conduction in the apparatus of language. In fact there are no aphasias caused by subcortical lesion. The justification for distinguishing a central aphasia from a conduction aphasia is also disputed. The language area of the cortex is seen rather as a continuous region of the cortex inserted between the motor fields of the cortex and those of the optic and auditory nerves – a region within which all communication and association subserving language function takes place. The so-called language centres revealed by the pathology of the brain correspond merely to the corners of this field of language; they are not distinguished functionally from the interior regions; it is only on account of their position in relation to the contiguous cortical centres that they produce more obvious signs when they become disordered.

The nature of the subject treated here called at many points for a closer investigation of the delimitation between the physiological and the psychological approach. Meynert's and Wernicke's views on the

years to the newly opened neurological department in an Institute for Children's Diseases, which had recently been founded by Max Kassowitz (1842–1913). These works are all the outcome of this appointment.]

1 [This book is generally regarded as Freud's most important contribution to neurology. Freud had lectured on aphasia some years before (in 1886 and 1887) and contributed articles on it to Villaret's encyclopaedia of medicine (1888*b*) and Bum's diagnostic lexicon (Freud, 1893–94*a*). All of these works are included in *NSW*, **4**.]

localization of ideas [*Vorstellungen*][T] in nervous elements have had to be rejected and Meynert's account of a depiction [*Abbildung*] of the body in [241] the cerebral cortex has required revision. Two facts of cerebral anatomy, namely (1) that the masses of fibres entering the spinal cord are constantly diminished on passing upwards, owing to the interposition of grey matter, and (2) that there are no direct paths from the periphery of the body to the cortex – these two facts lead to the conclusion that a really complete representation of the body is present only in the grey matter of the cord (as a 'projection'), whereas in the cortex the periphery of the body is only 'represented' [*vertreten*] in less detail through selected fibres arranged according to function.

XX

A Clinical Study of the Unilateral Cerebral Palsies in Children.
[1891*a*.][I]
(In collaboration with Dr O. Rie.)
(No. III of *Beiträge zur Kinderheilkunde* [Contributions to Paediatrics] edited by Dr M. Kassowitz.)

A monograph describing this affection, based on studies of material in the First Public Institute for Children's Diseases in Vienna, directed by Kassowitz. In ten sections it deals with (1) the history and literature of the cerebral palsies of children; (2) 35 observations of the authors' own, which are then summarized in tabular form and described individually; (3) the analysis of the individual symptoms of the clinical picture; (4) the pathological anatomy; (5) the relations of cerebral palsy to epilepsy and, (6) to infantile poliomyelitis; (7) differential diagnosis and (8) therapy. A 'choreatic paresis' is described by the authors for the first time; it is distinguished by peculiar characteristics in its onset and course, and in it the unilateral paresis is from the beginning represented by hemichorea. There is further an account of the findings of an autopsy (lobar sclerosis as a result of an embolism of the middle cerebral artery) on a woman patient described in the *Iconographie de la Salpêtrière* [**3**, 22–30].[2] [242] Emphasis is laid on the close relations between epilepsy and the cerebral palsies of children, in consequence of which some cases of apparent epilepsy might deserve to be described as 'cerebral palsy without palsy'.

1 [Included in *NSW*, **2**. This is a volume of over two hundred pages. Freud's collaborator, his friend Oscar Rie, was a paediatrician also attached to the Kassowitz Institute (see above, p. 239 f. *n*. 3).]

2 [This was a case entrusted to Freud by Charcot; the patient had been in the Salpêtrière since 1853. Cf. Freud's obituary of Charcot, p. 14 *n*. 1 above.]

In connection with the much discussed question as to the existence of a *polioencephalitis acuta*, which is supposed to constitute the anatomical basis of unilateral cerebral palsy and to offer a complete analogy with *poliomyelitis infantilis*, the authors argue against this hypothesis of Strümpell's; but they hold firmly to the expectation that a modified view of *poliomyelitis acuta infantilis* will allow of its being equated with cerebral palsy on another basis. In the therapeutic section are collected the hitherto published reports on the intervention by brain surgeons directed to the cure of genuine or traumatic epilepsy.

XXI

'A case of successful treatment by hypnotism with some remarks on the origin of hysterical symptoms through "counterwill".' [1892–93*a*.][1]

A young woman after the birth of her first child was compelled to give up breast-feeding it owing to a complex of hysterical symptoms (loss of appetite, sleeplessness, pains in her breasts, failure of milk secretion, agitation). When, after the birth of a second child, these obstacles recurred, deep hypnosis on two occasions, accompanied by counter-suggestions, succeeded in removing the obstacles, so that the patient became an excellent nursing mother. The same result was brought about a year later in similar circumstances after two more hypnoses. Some remarks are appended on the fact that it is possible in hysterical patients
[243] for distressing antithetic or anxious ideas to be realized[2] which normal people are able to inhibit; several observations of tic are traced back to this mechanism of 'counterwill'.

XXII

'Charcot.' [1893*f*.][3]

An obituary of the master of neuropathology who died in 1893 and among whose pupils the present writer numbers himself.

1 [This paper may be considered as Freud's first one on psychopathology, since the first half of it was published before the 'Preliminary Communication' (1893*a*). His interest in hypnotism goes back, of course, to his Paris visit, and he was using it himself from 1887. The paper is included in *RSE*, **1**, 145 ff.]

2 ['*Realisierung*.' In the paper itself the term used throughout is '*Objektivierung*', which is there rendered 'putting into effect'.]

3 [See above, p. 11 ff.]

XXIII

'On a symptom which often accompanies *enuresis nocturna* in children.' [1893*g*.][1]

In perhaps half the cases of children suffering from enuresis we find a hypertonia of the lower extremities the significance and implications of which are unexplained.

XXIV

'On the psychical mechanism of hysterical phenomena.'
(Preliminary communication in collaboration with Dr J. Breuer.)
[1893*a*.][2]

The mechanism to which Charcot traced back hysterotraumatic par- [244]
alyses, and the assumption of which enabled him to provoke them deliberately in hypnotized hysterical patients, can also be made responsible for numerous symptoms of what is described as non-traumatic hysteria. If we put the hysteric under hypnosis and lead his thoughts back to the time at which the symptom in question first appeared, a memory of a psychical trauma (or series of traumas) belonging to that time awakens in him with hallucinatory vividness, the symptom having persisted as a mnemic symbol of the trauma. Thus hysterics suffer mainly from reminiscences. If the traumatic scene which has been arrived at in this way is reproduced vividly, accompanied by a generation of affect, the symptom which has hitherto been obstinately maintained disappears. We must therefore suppose that the forgotten memory has been acting like a foreign body in the mind, with the removal of which the irritating phenomena cease. This discovery, first made by Breuer in 1881, can be made the basis of a therapy of hysterical phenomena which deserves to be described as 'cathartic'.

The memories which are revealed as 'pathogenic', as the roots of hysterical symptoms, are regularly 'unconscious' to the patient. It seems that by thus remaining unconscious they escape the wearing-away process to which psychical material is normally subject. A wearing away

1 [Included in *NSW*, **1**. There is no trace in this paper of any possible psychological determinants of the disorder. In sending a copy to Fliess on November 17, 1893, Freud (1950*a*, Letter 15) speaks of it contemptuously as '*ein Schmarren*' ('a rubbishy trifle').]

2 [This was included in *Studies on Hysteria* (1895*d*) and can be found in *RSE*, **2**, 3. Cf. also the lecture, p. 27 ff. above.]

of this sort is brought about by the method of 'abreaction'. Pathogenic memories avoid being dealt with by abreaction either because the experiences concerned have occurred in special psychical states to which hysterical persons are inherently inclined, or because those experiences have been accompanied by an affect which brings about a special psychical state in hysterical persons. A tendency to a 'splitting of consciousness' is accordingly the basic psychical phenomenon in cases of hysteria.

XXV

Concerning Knowledge of the Cerebral Diplegias of Childhood (With Reference to Little's Disease). [1893*b*.][1]
(No. III, New Series, of *Beiträge zur Kinderheilkunde*
[Contributions to Paediatrics] edited by Dr M. Kassowitz.)

[245] A supplement to *A Clinical Study of the Unilateral Cerebral Palsies in Children* summarized under XX above [p. 241]. The history, pathological anatomy and physiology of the affection are treated here in the same order as in the earlier monograph, and the relevant clinical pictures are illustrated by 53 observations made by the author himself. It was, however, necessary in addition to take into account the range of forms that must be described as 'cerebral diplegias' and to point out their clinical similarity. In face of the differences of opinion that prevail in the literature of these disorders, the author has adopted the standpoint of an earlier authority, Little,[2] and has thus arrived at the erection of four principal types, which are described as general spasticity, paraplegic spasticity, general chorea and bilateral athetosis, and bilateral spastic hemiplegia (spastic diplegia).

General spasticity includes the forms which are usually referred to as 'Little's disease'. Paraplegic spasticity is the name given to what was earlier regarded as a spinal affection, *tabes spastica infantilis*. The spastic diplegias correspond most easily to a doubling of unilateral cerebral

1 [Included in *NSW*, **2**. This monograph is comparable in dimensions to its pendant, No. XX. Freud sent a copy of it to Fliess on May 30, 1893, with the comment that 'it is not very interesting' (Freud, 1950*a*, Letter 12). In another letter, dealing with the psychoneuroses, a year later (May 21, 1894) he wrote: 'There is something comic in the disparity between one's own and other people's estimate of one's intellectual work. Take that book on the diplegias, which I knocked together with a minimum of interest and effort – almost as a lark. It has had a tremendous success. The critics say the nicest things about it. The French reviews in particular are overflowing with praise. . . . But for really good things, like my aphasia, or the paper on obsessions that is soon coming out, or like my future aetiology and theory of the neuroses, I can expect nothing better than respectful failure.' (Ibid., Letter 18.)]

2 [W. J. Little (1810–94).]

palsies, but are characterized by a superfluity of symptoms which finds its explanation in the bilateral nature of the cerebral affection. The justification for including general chorea and bilateral athetosis among these types is provided by numerous characteristics of the clinical picture and by the existence of many mixed and transitional forms which link all these types together. [246]

A discussion follows of the relations of these clinical types to the aetiological factors which are here assumed to be operative and to the insufficient number of post-mortem findings that have been reported. The following conclusions are reached:

Cerebral diplegias can be divided according to their origin into (*a*) those congenitally determined, (*b*) those arising at the time of birth and (*c*) those acquired after birth. But it is extremely rarely that this distinction can be drawn from the clinical peculiarities of the case, and not always possible from the anamnesis. All the aetiological factors of the diplegias are enumerated: prenatal (trauma, illness, or shock affecting the mother, place of the child in the family); operative at the time of birth (the factors stressed by Little, namely premature birth, difficult labour, asphyxia); and after birth (infectious diseases, trauma or shock affecting the child). Convulsions cannot be regarded as causes but only as symptoms of the affection. The aetiological part played by inherited syphilis is recognized as important. There is no exclusive relation between any one of these aetiologies and any one type of cerebral diplegia, but preferential relations are often apparent. The view that cerebral diplegias are affections with a single aetiology is untenable.

The pathological findings in the diplegias are of many kinds, and in general the same as in the hemiplegias; for the most part they are in the nature of end stages, from which it is not invariably possible to infer back to the initial lesions. They do not as a rule allow of a decision as to the aetiological category to which a case is to be referred. Nor is it usually possible to deduce the clinical picture from the post-mortem findings; so that the assumption that there are intimate and exclusive relations between clinical types and anatomical changes must also be rejected.

The pathological physiology of cerebral diplegias has an essential connection with the two characteristics by which both general and paraplegic spasticity are distinguished from other manifestations of organic disease of the cerebrum. For in both these clinical forms contracture predominates over paralysis and the lower extremities are affected more severely than the upper ones. The discussion in this paper reaches the conclusion that the more intense affection of the lower extremities in [247]

general and paraplegic spasticity must be connected with the localization of the lesion (meningeal haemorrhage along the median fissure) and the preponderance of contracture with the superficiality of the lesion. The strabismus of diplegic children, which is particularly common in paraplegic spasticity and where premature birth is the aetiology, is traceable to the retinal haemorrhages in newborn children described by Königstein.

A special section directs attention to the numerous instances of the familial and hereditary occurrence of children's diseases which show a clinical affinity with cerebral diplegias.

XXVI

'On familial forms of cerebral diplegia.' [1893*d*.][1]

An observation of two brothers, one six and a half and the other five years old, whose parents were blood relations, and who present a complicated clinical picture which has gradually developed, in the one case since birth and in the other since the second year. The symptoms of this familial disorder (lateral nystagmus, atrophy of the optic nerve, alternating convergent strabismus, monotonous and, as it were, scanning speech, intention tremor of the arms, spastic weakness of the legs, accompanied by high intelligence) give grounds for constructing a new affection which is to be regarded as a spastic counterpart to Friedreich's disease and on that account classed among the familial cerebral diplegias. Emphasis is laid on the far-reaching similarity of these cases to those described as multiple sclerosis by Pelizaeus in 1885.

'The infantile cerebral diplegias.' [1893*e*.][2]

A summary of the findings in the monograph abstracted above, No. XXV.

1 [Included in *NSW*, **2**.]

2 [Included in *NSW*, **2**. In French, contributed to a periodical edited by Pierre Marie (Charcot's successor at the Salpêtrière), who had written a highly laudatory review of the monograph (cf. footnote 1, p. 244 above) and no doubt asked Freud for this summary.]

XXVIII

'Some points for a comparative study of organic and hysterical motor paralyses.' [1893*c*.][1]

A comparison between organic and hysterical paralyses made under the influence of Charcot in order to arrive at a line of approach to the nature of hysteria. Organic paralysis is either peripherospinal or cerebral. On the basis of discussions in my critical study on the aphasias [No. XIX above], the former is described as *projection* paralysis and is paralysis *en détail*, and the latter is described as *representation* paralysis and is paralysis *en masse*.[2] Hysteria imitates only the latter category of paralyses but has freedom to specialize which makes it resemble projection paralysis; it can dissociate the areas of paralysis which regularly occur in cerebral affections. Hysterical paralysis has a tendency to excessive development; it can be extremely intense and yet strictly confined to a small area, while cortical paralysis regularly increases its extent with an increase in its intensity. Sensibility behaves in a directly contrary manner in the two kinds of paralysis. [248]

The special characteristics of cortical paralysis are determined by the peculiarities of cerebral structure, and allow us to infer back to the anatomy of the brain. Hysterical paralysis on the contrary behaves as though there were no such thing as cerebral anatomy. Hysteria knows nothing of the anatomy of the brain. The alteration which underlies hysterical paralysis can have no resemblance to organic lesions but must be looked for in the conditions governing the accessibility of some particular circle of ideas.

'The neuropsychoses of defence: an attempt at a psychological theory of acquired hysteria, of many phobias and obsessions and of certain hallucinatory psychoses.' [1894*a*.][3]

The first of a series of short papers which now follow and which are directed to the task of preparing a general exposition of the neuroses on a new basis which is now in hand. [249]

1 [The original of this paper is in French. It is included in *RSE*, **1**, 187 ff., and *NSW*, **4**.]

2 [Cf. the last paragraph of No. XIX. The point is fully explained in the paper itself, in *RSE*, **1**, 187.]

3 [See above, p. 43 ff.]

The splitting of consciousness in hysteria is not a primary characteristic of this neurosis, based on degenerative weakness, as Janet insists. It is the consequence of a peculiar psychical process known as 'defence' [*Abwehr*][T] which is shown by some short reports of analyses to be present not only in hysteria but in numerous other neuroses and psychoses. Defence comes into operation when an instance of incompatibility arises in ideational life between a particular idea and the 'ego' [*Ich*][T]. The process of defence may be figuratively represented as though the quota of excitation [*Erregungsbetrag*][T] were torn away from the idea that is to be repressed [*verdrängten*][T] and put to some other use. This can occur in a variety of ways: in hysteria the liberated sum of excitation is transformed into somatic innervation (*conversion hysteria*); in obsessional neurosis [*Zwangsneurose*][T] it remains in the psychical field and attaches itself to other ideas which are not incompatible in themselves and which are thus *substituted* for the repressed idea. The source of the incompatible ideas which are subjected to defence is solely and exclusively sexual life. An analysis of a case of hallucinatory psychosis shows that this psychosis too represents a method of achieving defence.

XXX

'Obsessions and phobias: their psychical mechanism and aetiology.'
[1895*c*.][I]

[250] Obsessions and phobias are to be distinguished from neurasthenia as independent neurotic affections. In both [obsessions and phobias] it is a question of the linkage between an idea and an affective state. In phobias the latter is always the same, namely anxiety [*Angst*][T]; in true obsessions it can be of various kinds (self-reproach, sense of guilt, doubt, etc.). The affective state emerges as the essential element of the obsession, since it remains unaltered in the individual case, whereas the idea attached to it is changed. Psychical analysis shows that the affect of the obsession is justified in every instance, but that the idea attached to it represents a substitute for an idea derived from sexual life which is more appropriate to the affect and which has succumbed to repression. This state of affairs is illustrated by numerous short analyses of cases of *folie du doute*, washing mania, arithmomania, etc., in which the reinstatement of the repressed idea was successful and accompanied by useful therapeutic effects. The phobias in the strict sense are reserved for the paper on anxiety neurosis (No. XXXII).

1 [The present paper is in French. See above, p. 67 ff.]

XXXI

Studies on Hysteria. [1895*d*.]
(In collaboration with Dr J. Breuer.)[1]

This volume contains the carrying through of the subject raised in the 'Preliminary Communication' (No. XXIV) dealing with the psychical mechanism of hysterical phenomena. Although it proceeds from the joint work of the two authors, it is divided into separate sections, of which four detailed case histories together with discussions and an attempt at a 'Psychotherapy of Hysteria' represent my share. The aetiological part played by the sexual factor is stressed with greater emphasis in this book than in [251]
the 'Preliminary Communication', and the concept of 'conversion' is used to throw light on the formation of hysterical symptoms. The essay on psychotherapy seeks to give some insight into the technique of the psychoanalytic procedure, which is alone able to lead to the investigation of the unconscious content of the mind, and the employment of which may also be expected to lead to important psychological discoveries.

XXXII

'On the grounds for detaching a particular syndrome from neurasthenia under the description "anxiety neurosis".' [1895*b*.][2]

The concurrence of a constant grouping of symptoms with a particular aetiological determinant makes it possible to pick out from the composite province of 'neurasthenia' a syndrome which deserves the name of 'anxiety neurosis', because all of its constituents arise from the symptoms of anxiety. These are either to be regarded as immediate manifestations of anxiety or as rudiments and equivalents of them (E. Hecker), and they are often in complete opposition to the symptoms which constitute neurasthenia proper. The aetiology of the two neuroses also points to an opposition of this kind. Whereas true neurasthenia arises from spontaneous emissions or is acquired through masturbation, the factors belonging to the aetiology of anxiety neurosis are such as correspond to a holding back of sexual excitation [*Erregung*] – such as abstinence when libido is present, unconsummated excitation and, above all, *coitus interruptus*. In actual life the neuroses here distinguished

1 [This book is translated in *RSE*, **2**.]

2 [See p. 81 ff. above.]

usually appear in combination, though pure cases can also be demonstrated. When a mixed neurosis of this kind is subjected to analysis, it is possible to indicate a mixture of several specific aetiologies.

An attempt to arrive at a theory of anxiety neurosis leads to a formula to the effect that its mechanism lies in *the deflection of somatic sexual excitation from the psychical field* and a consequent abnormal employment of that excitation. *Neurotic anxiety is transformed sexual libido*.

XXXIII

'A reply to criticisms of my paper on anxiety neurosis.' [1895*f*.][1]

[252] A reply to objections made by Löwenfeld to the content of No. XXXII. The problem of the aetiology of the pathology of the neuroses is dealt with here, to justify the division into three categories of the aetiological factors that appear: (*a*) preconditions, (*b*) specific causes and (*c*) concurrent or auxiliary causes. What are called preconditions are the factors which, though they are indispensable for producing the effect, cannot by themselves produce it but need in addition the specific causes. The specific causes are distinguished from the preconditions by the fact that they figure in only a few aetiological formulas, while the preconditions play the same part in numerous affections. Auxiliary causes are such as neither need invariably be present nor are able by themselves to produce the effect in question. – In the case of neuroses it is possible that the precondition may be heredity; the specific cause lies in sexual factors; everything else that is brought up apart from these as forming the aetiology of the neuroses (overwork, emotion, physical illness) is an auxiliary cause and can never entirely take the place of the specific factor, though it can no doubt serve as a substitute for it in the matter of *quantity*. The form of a neurosis depends on the nature of the specific sexual cause; whether there shall be a neurotic illness *at all* is determined by factors operating quantitatively; heredity works like a multiplier inserted in an electric circuit.

1 [See above, p. 109 ff.]

XXXIV

'On Bernhardt's disturbance of sensibility in the thigh.' [1895*e*.][1]

A self-observation of this harmless affection, which is probably traceable to local neuritis; and a report of some other cases, including bilateral ones. [253]

XXXV

'Further remarks on the neuropsychoses of defence.' [1896*b*.][2]

(1) *The specific aetiology of hysteria*. A continuation of psychoanalytic work with hysterical subjects has had the uniform result of showing that the suspected traumatic events (as mnemic symbols of which hysterical symptoms persist) occur in the patients' *earliest childhood* and are to be described as sexual abuses in the narrowest sense.

(2) *The nature and mechanism of obsessional neurosis*. Obsessional ideas are invariably transformed self-reproaches which have re-emerged from repression and which always relate to some sexual act that was performed with pleasure [*Lust*][T] in childhood. The course taken by this return of the repressed is traced, as are the results of a primary and secondary work of defence.

(3) *Analysis of a case of chronic paranoia*. This analysis, which is reported in detail, indicates that the aetiology of paranoia is to be found in the same sexual experiences of early childhood in which the aetiology of hysteria and of obsessional neurosis has already been discovered. The symptoms of this case of paranoia are traced in detail to the activities of defence.

XXXVI

'The aetiology of hysteria.' [1896*c*.][3]

More detailed reports of the infantile sexual experiences which have been shown to constitute the aetiology of the psychoneuroses. In their content these experiences must be described as 'perversions', and those responsible are as a rule to be looked for among the patient's nearest [254]

1 [Included in *NSW*, **1.** A disorder from which Freud suffered for a year or two at this time.]

2 [See above, p. 173 ff.]

3 [See above, p. 199 ff.]

relatives. A discussion of the difficulties which have to be surmounted in uncovering these repressed memories and of the objections that may be raised against the results thus arrived at. Hysterical symptoms are shown to be derivatives of memories operating unconsciously; they appear only in collaboration with such memories. The presence of infantile sexual experiences is an indispensable condition if the efforts of defence (which occur in normal people as well) are to result in producing pathogenic effects – that is to say, neuroses.

XXXVII

'Heredity and the aetiology of the neuroses.' [1896*a*.][1]

[255] The findings hitherto arrived at by psychoanalysis on the aetiology of the neuroses are here employed to criticize the current theories of the omnipotence of heredity in neuropathology. The part played by heredity has been overestimated in several directions. Firstly, by including among the inheritable neuropathic illnesses conditions such as headaches, neuralgias, etc., which are very probably attributable as a rule to organic affections of the cranial cavities (the nose). Secondly, by regarding every discoverable nervous ailment among relatives as evidence of hereditary taint and by thus from the first leaving no room for *acquired* neuropathic illnesses which can possess no similar evidential weight. Thirdly, the aetiological role of syphilis has been misunderstood and the nervous ailments deriving from it have been put down to the account of heredity. But in addition, a general objection is permissible against a form of heredity which is described as 'dissimilar inheritance' (or inheritance with a change in the form of the illness), and to which a far more important part is allotted than to 'similar' inheritance. But when the fact of hereditary taint in a family is demonstrated in its members being affected alternatively by every sort of nervous complaint – chorea, epilepsy, hysteria, apoplexy, etc. – without any more precise determinants, then either we need a knowledge of the laws according to which those complaints replace one another or else room is left for the individual aetiologies which determine precisely the choice of the neuropathic state which in fact results from them. If such particular aetiologies exist, they are the specific causes, so much sought after, of the various different clinical forms, and heredity is pushed back into the role of a requirement or precondition.

1 [This paper was written by Freud in French. It appears above, on p. 153 ff.]

XXXVIII

The Infantile Cerebral Palsies. [1897*a*.][1]

This is a summary of the two works on the same theme published in 1891 and 1893 [Nos. XX and XXV], together with the additions and alterations which have since become necessary. These affect the chapter on *poliomyelitis acuta*, which has meantime been recognized as a non-systematic disease, on encephalitis as an initial process of spastic hemiplegia, and on the interpretation of cases of paraplegic spasticity, the cerebral nature of which affection may recently have been placed in doubt. A special discussion is concerned with the attempts to split up the content of the cerebral diplegias into several clearly divided clinical entities, or at least to separate what is known as 'Little's disease' as a clinical entity from among the medley of forms of similar affections. The difficulties which meet such attempts are pointed out, and it is maintained as the only justifiable view that 'infantile cerebral palsy' shall be retained at present as a collective clinical concept for a whole number of similar affections with an exogenous aetiology. The rapid increase in observations of familial and hereditary nervous disorders of children, which resemble infantile cerebral palsies clinically at many points, has made it a pressing matter to collect these new forms and to attempt to draw a fundamental distinction between them and infantile cerebral palsies. [256]

1 [Included in *NSW*, **3**. This was Freud's last major publication on a neurological subject. It was prepared at Nothnagel's request for his great encyclopaedia of medicine, of which it forms Part II, Section II of Volume IX. This is the bulkiest of all Freud's neurological works, well over three hundred pages long and with over four hundred entries in the bibliography. He was engaged on it for some years, and seems quite to have lost interest in it, to judge from his caustic letters on the subject to Fliess (see p. 257 below).]

The present translation is a revised and corrected reprint of the *SE* version.

This paper was finished, as we learn from a letter to Fliess (Freud, 1950*a*, Letter 83), on February 9, 1898. It had been begun already a month earlier (ibid., Letter 81), and in both these letters Freud speaks of it contemptuously as a '*Gartenlaube*' article. This was the title (literally 'garden arbour') of a family magazine whose name had become proverbial for its sentimental stories. But he adds that the paper 'is fairly impudent and chiefly designed to cause trouble – which it will succeed in doing. Breuer will say that I have done myself a lot of harm.'

Two years had elapsed since Freud's last paper on psychopathology, 'The Aetiology of Hysteria' (1896*c*), and during those two years a very great deal had happened to occupy his mind. Perhaps the least important thing (at any rate from our point of view) was his completion by the beginning of 1897 of his 300-page treatise on children's palsies for Nothnagel's great encyclopaedia of medicine, on which he had been most unwillingly engaged for several years past, and which was his last major [262] neurological work. Cf., for instance, letters to Fliess of October 20, 31 and November 8, 1895, June 4 and November 2, 1896, and January 24, 1897 (Freud, 1950*a*, Letters 32, 33, 35, 47, 50 and 57). Once this task was out of the way, he was able to devote himself more completely to psychology, and he was soon involved in what

was to prove an epoch-making event – his own self-analysis. This began in the summer of 1897, and already by the autumn had led to some fundamental discoveries: the abandonment of the traumatic theory of the aetiology of the neuroses (September 21, Letter 69), the discovery of the Oedipus complex (October 15, Letter 71) and the gradual recognition of infantile sexuality as a normal and universal fact (e.g. November 14, Letter 75).

Of all these developments (and of the parallel advances in Freud's understanding of dream psychology) there is scarcely a trace to be found in the present paper; and this no doubt accounts for its author's contempt for it. As regards fundamentals it carries things no further than the point at which they stood two years before: Freud was reserving himself for his next major effort which was to follow in still another two years in *The Interpretation of Dreams* (1900*a*), *RSE*, **4–5**.

But if the first part of the paper contains little more than a restatement of Freud's earlier views on the aetiology of the neuroses, the argument also presents us with something new – an approach to sociological problems. The outspoken criticism here of the attitude of the medical profession to matters of sex, and in particular to masturbation, to the use of contraceptives and to the difficulties of married life, foreshadows[1] a whole series of Freud's later animadversions against the social conventions of civilization – beginning with the paper on '"Civilized" Sexual Morality' (1908*d*), ibid., **9**, and ending with *Civilization and its Discontents* (1930*a*), ibid., **21**.

1 See also the (1895*i*) review of Hegar's book on the sexual drive, p. 147 f. above.

SEXUALITY IN THE AETIOLOGY OF THE NEUROSES

Exhaustive researches during the last few years have led me to recognize [263]
that the most immediate and, for practical purposes, the most significant causes of every case of neurotic illness are to be found in factors arising from sexual life. This theory is not entirely new. A certain amount of importance has been allowed to sexual factors in the aetiology of the neuroses from time immemorial and by every writer on the subject. In certain marginal regions of medicine a cure for 'sexual complaints' and for 'nervous weakness' has always been promised in the same breath. When once the validity of the theory ceases to be denied, therefore, it will not be hard to dispute its originality.

In a few short papers which have appeared during the last years in the *Neurologisches Zentralblatt* [1894*a*, 1895*b* and 1896*b*], the *Revue Neurologique* [1895*c* and 1896*a*] and the *Wiener klinische Rundschau* [1895*f* and 1896*c*],[1] I have tried to give an indication of the material and the points of view which offer scientific support for the theory of the 'sexual aetiology of the neuroses'. A full presentation is, however, still wanting, mainly because, in endeavouring to throw light on what is recognized as the actual state of affairs, we come upon ever fresh problems for the solution to which the necessary preliminary work has not been done. It does not seem to me at all premature, however, to attempt to direct the attention of medical practitioners to what I believe to be the facts so that they may convince themselves of the truth of my assertions and at the same time of the benefits they may derive in their practice from a knowledge of them.

I am aware that efforts will be made, by the use of arguments with an ethical colouring, to prevent the physician from pursuing the matter further. Anyone who wants to make certain whether or not his patients' neuroses are really connected with their sexual life cannot avoid asking them about their sexual life and insisting upon receiving a true account of it. But in this, it is asserted, lies the danger both for the individual and [264]

1 [All of them in the present volume.]

society. A doctor, I hear it being said, has no right to intrude upon his patients' sexual secrets and grossly injure their modesty (especially with women patients) by an interrogation of this sort. His clumsy hand can only ruin family happiness, offend the innocence of young people and encroach upon the authority of parents; and where adults are concerned he will come to share uncomfortable knowledge and destroy his own relations with his patients. It is therefore his ethical duty, the conclusion is, to keep away from the whole business of sex.

To this one may well reply that it is the expression of a prudery which is unworthy of a physician and which inadequately conceals its weakness behind bad arguments. If factors arising out of sexual life must really be acknowledged to be causes of illness, then, for that very reason, investigation and discussion of them automatically falls within the sphere of a physician's duty. The injury to modesty of which he is guilty in this is no different and no worse, one would imagine, than when he insists on examining a woman's genital organs in order to cure a local affection – a demand on which he is pledged to insist by his medical training itself. Even now one often hears elderly women who have spent their youth in the provinces tell of how at one time they were reduced to a state of exhaustion by excessive genital haemorrhages, because they could not make up their minds to allow a doctor to see their nakedness. The educative influence which has been exercised on the public by the medical world has, in the course of one generation, so altered things that an objection of this sort is an extremely rare occurrence among the young women of today. If it were to occur, it would be condemned as unreasonable prudery, as modesty in the wrong place. Are we living in Turkey, a husband would ask, where all that a sick woman may show to the physician is her arm through a hole in the wall?

It is not true that interrogation of his patients and knowledge about their sexual concerns give the physician a dangerous degree of power over them. It was possible in earlier times for the same objection to be made against the uses of anaesthetics, which deprive the patient of his consciousness and of the exercise of his will and leave it to the doctor to decide whether and when he shall regain them. And yet today anaesthetics have become indispensable to us because they are able, better [265] than anything else, to assist the doctor in his medical work; and, among his many other serious obligations, he has taken over the responsibility for their use.

A doctor can always do harm if he is unskilful or unscrupulous, and this is no more and no less true where it is a question of investigating his

patients' sexual life than it is in other things. Naturally, if someone, after an honest self-examination, feels that he does not possess the tact, seriousness and discretion which are necessary for questioning neurotic patients, and if he is aware that revelations of a sexual character would provoke lascivious thrills in him rather than scientific interest, then he will be right to avoid the topic of the aetiology of the neuroses. All we ask, in addition, is that he should also refrain from treating nervous patients.

Nor is it true that patients put insuperable obstacles in the way of an investigation into their sexual life. After some slight hesitation, adults usually adjust themselves to the situation by saying: 'After all, I'm at the doctor's; I can say anything to him.' A great many women who find it difficult enough to go through life concealing their sexual feelings are relieved to find that with the doctor no other consideration outweighs that of their recovery, and they are grateful to him that for once they are allowed to behave quite humanly about sexual things. A dim knowledge of the overwhelming importance of sexual factors in the production of neuroses (a knowledge which I am trying to capture afresh for science) seems never to have been lost in the consciousness of laymen. How often do we witness scenes like this: A married couple, one of whom is suffering from a neurosis, comes to us for consultation. After we have made a great many introductory remarks and apologies to the effect that no conventional barriers should exist between them and the doctor who wants to be of use in such cases, and so on, we tell them that we suspect that the cause of the illness lies in the unnatural and detrimental form of sexual intercourse which they must have chosen since the wife's last confinement. We tell them that doctors do not as a rule concern themselves with such matters, but that that is reprehensible of them, even though the patients do not want to be told about things like that, etc. Thereupon one of the couple nudges the other and says: 'You see! I told you all along it would make me ill.' And the other answers: 'Well, I know, [266]
I thought so too; but what is one to do?'

In certain other circumstances, such as when one is dealing with young girls, who, after all, are systematically brought up to conceal their sexual life, one will have to be content with a very small measure of sincere response on the part of the patient. But an important consideration comes into play here – namely that a doctor who is experienced in these things does not meet his patients unprepared and as a rule does not have to ask them for information but only for a confirmation of his surmises. Anyone who will follow my indications as to how to elucidate

the morphology of the neuroses and translate it into aetiological terms will need the addition of very few further admissions from his patients; in the very description of their symptoms, which they are only too ready to give, they have usually acquainted him at the same time with the sexual factors that are hidden behind.

It would be a great advantage if sick people had a better knowledge of the certainty with which a doctor is now in a position to interpret their neurotic complaints and to infer from them their operative sexual aetiology. It would undoubtedly spur such people on to abandon their secretiveness from the moment they have made up their minds to seek help for their sufferings. Moreover, it is in the interest of all of us that a higher degree of honesty about sexual things should become a duty among men and women than has hitherto been expected of them. This cannot be anything but a gain for sexual morality. In matters of sexuality we are at present, every one of us, ill or well, nothing but hypocrites. It will be all to our good if, as a result of such general honesty, a certain amount of toleration in sexual concerns should be attained.

Doctors usually take very little interest in a good many of the questions which are discussed among neuropathologists in connection with the neuroses: whether, for instance, one is justified in making a strict differentiation between hysteria and neurasthenia, whether one may distinguish hystero-neurasthenia alongside of them, whether obsessions should be classed with neurasthenia or recognized as a separate neurosis, and so on. And, indeed, such distinctions may well be a matter
[267] of indifference to a practitioner, so long as no further consequences follow from the decisions arrived at – no deeper insight and no pointers for therapeutic treatment – and so long as the patient will in every instance be sent off to a hydropathic establishment, or be told that there is nothing the matter with him. But it will be a different thing if our point of view about the causative relations between sexuality and the neuroses is adopted. Fresh interest is then aroused in the symptomatology of the different neurotic cases, and it becomes of practical importance that one should be able correctly to break down the complicated picture into its components and correctly to name them. For the morphology of the neuroses can with little difficulty be translated into aetiology and a knowledge of the latter leads on quite naturally to new indications for methods of cure.

Now the important decision we have to make – and this can be done with certainty in every instance if the symptoms are carefully assessed – is whether the case bears the characteristics of neurasthenia or of a

psychoneurosis (hysteria, obsessions [*Zwangsvorstellungen*])[T]. (Mixed cases in which signs of neurasthenia are combined with signs of a psychoneurosis are of very frequent occurrence; but we will leave consideration of them till later.) It is only in neurasthenias that questioning the patient succeeds in disclosing the aetiological factors in his sexual life [*Sexualleben*][T]. These factors are, of course, known to him and belong to the present time, or, more properly, to the period of his life since sexual maturity [*Geschlechtsreife*] (though this delimitation does not cover every case). In psychoneuroses questioning of this kind has little result. It may perhaps give us a knowledge of the factors which have to be recognized as precipitating ones, and these may or may not be connected with sexual life. If they are, they show themselves to be no different in kind from the aetiological factors of neurasthenia; that is, they entirely lack any specific relation to the causation of the psychoneurosis. And yet, in every instance, the aetiology of the psychoneuroses, too, lies in the field of sexuality. By a curious circuitous path, of which I shall speak later, it is possible to arrive at a knowledge of this aetiology and to understand why the patient was unable to tell us anything about it. For the events and influences which lie at the root of every psychoneurosis belong, not to the present day, but to an epoch of life which is long past and which is, as it were, a prehistoric one – to the time of early childhood; and that is why the patient, too, knows nothing of them. He has – though only in a particular sense – forgotten them.

Zwang

Geschlecht

[268]

Thus, in every case of neurosis there is a sexual aetiology; but in neurasthenia it is an aetiology of a present-day [*aktueller*][T] kind, whereas in the psychoneuroses the factors are of an infantile nature. This is the first great contrast in the aetiology of the neuroses. A second one emerges when we take account of a difference in the symptomatology of neurasthenia itself. Here, on the one hand, we find cases in which certain complaints characteristic of neurasthenia (intracranial pressure, proneness to fatigue, dyspepsia, constipation, spinal irritation, etc.) are prominent; in other cases these signs play a minor part and the clinical picture is composed of other symptoms, all of which exhibit a relation to the nuclear symptom, that of anxiety [*Angst*][T] (free anxiousness, unrest, expectant anxiety, complete, rudimentary or supplementary anxiety attacks, locomotor vertigo, agoraphobia, insomnia, increased sensitivity to pain, and so on). I have left the name of neurasthenia to the first type, but have distinguished the second type as 'anxiety neurosis'; and I have given reasons for this separation in another place,[1] where I have also

Aktualneurose

1 [See Freud's first paper on anxiety neurosis (1895*b*), p. 81 ff. above.]

taken account of the fact that as a rule both neuroses appear together.[1] For the present purpose it is enough to emphasize that parallel to the difference in the symptoms of these two forms of illness there goes a difference in their aetiology. Neurasthenia can always be traced back to a condition of the nervous system such as is acquired by excessive masturbation or arises spontaneously from frequent emissions; anxiety neurosis regularly discloses sexual influences which have in common the factor of reservation or of incomplete satisfaction – such as *coitus interruptus*, abstinence together with a lively libido, so-called unconsummated excitation [*Erregung*][T], and so on. In my short paper intended to introduce anxiety neurosis I put forward the formula that anxiety is always libido which has been deflected from its [normal] employment.[2]

Where there is a case in which symptoms of neurasthenia and of anxiety neurosis are combined – where, that is, we have a mixed case – we have only to keep to our proposition, empirically arrived at, that a mingling of neuroses implies the collaboration of several aetiological factors, [269] and we shall find our expectation confirmed in every instance. How often these aetiological factors are linked with one another organically, through the interplay of sexual processes – for instance, *coitus interruptus* or insufficient potency in the man, going along with masturbation – would well deserve separate discussion.

Having diagnosed a case of neurasthenic neurosis with certainty and having classified its symptoms correctly, we are in a position to translate the symptomatology into aetiology; and we may then boldly demand confirmation of our suspicions from the patient. We must not be led astray by initial denials [*Widerspruch*]. If we keep firmly to what we have inferred, we shall in the end conquer every resistance by emphasizing the unshakeable nature of our convictions. In this way we learn all sorts of things about the sexual life of men and women, which might well fill a useful and instructive volume; and we learn, too, to regret from every point of view that sexual science is even today still regarded as disreputable. Since minor deviations from a normal *vita sexualis* are much too common for us to attach any value to their discovery, we shall only allow a serious and long-continued abnormality in the sexual life of a neurotic patient to carry weight as an explanation. Moreover, the idea that one might, by one's insistence, cause a patient who is psychically normal to accuse himself falsely of sexual misdemeanours – such an idea may safely be disregarded as an imaginary danger.

1 [P. 100 ff. above.]

2 [P. 96 above.]

If one proceeds in this manner with one's patients, one also gains the conviction that, so far as the theory of the sexual aetiology of neurasthenia is concerned, there are no negative cases. In my mind, at least, the conviction has become so certain that where an interrogation has shown a negative result, I have turned this to account too for diagnostic purposes. I have told myself, that is, that such a case cannot be one of neurasthenia. In this way I have been led in several instances to assume the presence of progressive paralysis instead of neurasthenia, because I had not succeeded in establishing the fact – a fact that was necessary for my theory – that the patient indulged very freely in masturbation; and the further course of those cases later confirmed my view. In another instance the patient, who exhibited no clear organic changes, complained of intracranial pressure, headaches and dyspepsia, but countered my suspicions about his sexual life straightforwardly and with unshaken [270]
certainty; and the possibility occurred to me that he might have a latent suppuration in one of his nasal sinuses. A specialist colleague of mine confirmed this inference I had made from the negative sexual results of my interrogation, by removing the pus from the patient's antrum and relieving him of his ailments.

The appearance of there nevertheless being 'negative cases' can arise in another way as well. Sometimes an interrogation discloses the presence of a normal sexual life in a patient whose neurosis, on a superficial view, does in fact closely resemble neurasthenia or anxiety neurosis. But a more deep-going investigation regularly reveals the true state of affairs. Behind such cases, which have been taken for neurasthenia, there lies a psychoneurosis – hysteria or obsessional neurosis [*Zwangsneurose*]. Hysteria especially, which imitates so many organic affections, can easily assume the appearance of one of the 'actual neuroses' [*aktuellen Neurosen*] by elevating the latter's symptoms into hysterical ones. Such hysterias in the form of neurasthenia are not even very rare. Falling back on psychoneurosis when a case of neurasthenia shows a negative sexual result is, however, no cheap way out of the difficulty; the proof that we are right is to be obtained by the method which alone unmasks hysteria with certainty – the method of psychoanalysis, to which we shall refer presently.

There may perhaps be some, however, who are quite willing to recognize the sexual aetiology in their neurasthenic patients, but who nevertheless blame it as one-sidedness if they are not asked to pay attention as well to the other factors which are always mentioned by the authorities as causes of neurasthenia. Now it would never occur to me to

substitute a sexual aetiology in neuroses for every other aetiology, and so to assert that the latter have no operative force [*Wirksamkeit*]. This would be a misunderstanding. What I think is rather that in addition to all the familiar aetiological factors which have been recognized – and probably correctly so – by the authorities as leading to neurasthenia, the sexual factors, which have not hitherto been sufficiently appreciated,
[271] should also be taken into account. In my opinion, however, these sexual factors deserve to be given a special place in the aetiological series.[1] For they alone are never absent in any case of neurasthenia, they alone are capable of producing the neurosis without any further assistance, so that those other factors seem to be reduced to the role of an auxiliary and supplementary aetiology, and they alone allow the physician to recognize firm relations between their manifold nature and the multiplicity of the clinical pictures. If, on the other hand, I group together all the patients who have ostensibly become neurasthenic from overwork, emotional agitation, as an after-effect of typhoid fever, and so on, they show me nothing in common in their symptoms. The nature of their aetiology gives me no idea of what kind of symptoms to expect, any more than, conversely, does the clinical picture they present enable me to infer what aetiology is at work in them.

The sexual causes, too, are the ones which most readily offer the physician a foothold for his therapeutic influence. Heredity is no doubt an important factor, when it is present; it enables a strong pathological effect to come about where otherwise only a very slight one would have resulted. But heredity is inaccessible to the physician's influence; everyone is born with his own hereditary tendencies to illness, and we can do nothing to change them. Nor should we forget that it is precisely in regard to the aetiology of the neurasthenias that we must necessarily deny the first place to heredity. Neurasthenia (in both its forms) is one of those affections which anyone may easily acquire without having any hereditary taint. If it were otherwise, the enormous increase in neurasthenia, of which all the authorities complain, would be unthinkable. In what concerns civilization [*Zivilisation*][T], among whose sins people so often include responsibility for neurasthenia, these authorities may indeed be right (although the way in which this comes about is probably quite different from what they imagine).[2] Yet the state of our civilization is, once again, something that is unalterable for the individual. Moreover, this factor, being common to all the members of the same society,

1 [For this and what follows see the second paper on anxiety neurosis (1895*f*), p. 119 f. above.]

2 [See p. 272 below.]

can never explain the fact of selectivity in the incidence of the illness. The physician who is not neurasthenic is exposed to the same influence of an allegedly detrimental civilization as the neurasthenic patient whom he has to treat.[1] Subject to these limitations, the factors of exhaustion retain their significance. But the element of 'overwork', which physicians are so fond of producing to their patients as the cause of their neurosis, is too often unduly misused. It is quite true that anyone who, owing to sexual noxae, has made himself disposed to neurasthenia, tolerates intellectual work and the psychical exigencies of life badly; but no-one ever becomes neurotic through work or excitement alone. Intellectual work is rather a protection against falling ill of neurasthenia; it is precisely the most unremitting intellectual workers who remain exempt from neurasthenia, and what neurasthenics complain of as 'overwork that is making them ill' does not as a rule deserve to be called 'intellectual work' at all, either in its quality or quantity. Physicians will have to become accustomed to explaining to an office worker who has been 'overworked' at his desk or to a housewife for whom her domestic activities have become too heavy that they have fallen ill, not because they have tried to carry out duties which are in fact easily performed by a civilized brain, but because all the while they have been grossly neglecting and damaging their sexual life.[2] [272]

Furthermore, it is only the sexual aetiology which makes it possible for us to understand all the details of the clinical history of neurasthenics, the mysterious improvements in the middle of the course of the illness and the equally incomprehensible deteriorations, both of which are usually related by doctors and patients to whatever treatment has been adopted. In my records, which include more than two hundred cases, there is, for instance, the story of a man who, when the treatment prescribed by his family physician had done him no good, went to Pastor Kneipp[3] and for a year after being treated by him showed an extraordinary improvement in the middle of his illness. But when, a year later, his symptoms grew worse once more and he again went to Wörishofen for help, the second treatment was unsuccessful. A glance into the [273]

1 [Cf. the much fuller discussions of this question in the paper on '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*) and in *Civilization and its Discontents* (1930*a*). Further references can be found in the Editors' Notes to these works, *RSE*, **9**, 157, and ibid., **21**, 56 ff.]

2 [Some remarks on 'overwork' occur in the second of the *Three Essays* (1905*d*), ibid., **7**, 180, and in a footnote to Section III of the late technical paper on 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 204 *n*. 2.]

3 [Sebastian Kneipp (1821–97), of Bad Wörishofen in Swabia, was famous for his cold-water and 'nature cure'. Part of his treatment consisted in walking barefoot through wet grass. The present case had been referred to more briefly by Freud in his first paper on anxiety (1895*b*), p. 93 above. See also Freud's (1904*c*) review of Baumgarten's book on neurasthenia, *RSE*, **7**, 316 f.]

patient's family record solved the double riddle. Six and a half months after his first return from Wörishofen his wife bore him a child. This meant that he had left her at the beginning of a pregnancy of which he was not yet aware; after his return he was able to practise *natural* intercourse with her. At the close of this period, which had a curative effect on him, his neurosis was started up afresh by his once more resorting to *coitus interruptus*; the second treatment was bound to prove a failure, since this pregnancy of his wife's remained her last.

There was a similar case, in which, once again, the treatment had an unexpected effect which called for an explanation. This case turned out to be still more instructive, for it exhibited a puzzling alternation in the symptoms of the neurosis. A young neurotic patient had been sent by his physician to a reputable hydropathic establishment on account of a typical neurasthenia. There his condition steadily improved at first, so that there was every prospect that he would be discharged as a grateful disciple of hydrotherapy. But in the sixth week a complete change occurred; the patient 'could no longer tolerate the water', became more and more nervous, and finally left the establishment after two more weeks, uncured and dissatisfied. When he complained to me about this therapeutic fraud I asked him a few questions about the symptoms which had overtaken him in the middle of the treatment. Curiously enough, a complete change had come over them. He had *entered* the sanatorium with intracranial pressure, fatigue and dyspepsia; what had troubled him *during* the treatment were excitement, attacks of dyspnoea, vertigo in walking, and disturbances of sleep. I was now able to say to him: 'You are doing hydrotherapy an injustice. As you yourself very well knew, you fell ill as a result of long-continued masturbation. In the sanatorium you gave up this
[274] form of satisfaction, and therefore you quickly recovered. When you felt well, however, you unwisely sought to have relations with a lady – a fellow patient, let us suppose – which could only lead to excitement without normal satisfaction. The beautiful walks in the neighbourhood of the establishment gave you ample opportunity for this. It was this relationship, not a sudden inability to tolerate hydrotherapy, which caused you to fall ill once more. Moreover, your present state of health leads me to conclude that you are continuing this relationship here in town as well.' I can assure my readers that the patient confirmed what I said, point by point.

The present treatment of neurasthenia – which is, perhaps, carried out most successfully in hydropathic establishments – has as its aim the amelioration of the nervous condition by means of two factors: shielding

the patient and strengthening him. I have nothing to say against such a method of treatment, except that it takes no account of the circumstances of the patient's sexual life. According to my experience, it is highly desirable that the medical directors of such establishments should become properly aware that they are dealing, not with victims of civilization or heredity, but – *sit venia verbo* – with people who are crippled in sexuality. They would then, on the one hand, be more easily able to account for their successes as well as their failures; and, on the other, they would achieve new successes which, till now, have been at the mercy of chance or of the patient's unguided behaviour. If we take a neurasthenic woman, suffering from anxiety, away from her home and send her to a hydropathic establishment, and if there, freed from all duties, she is made to bathe and take exercise and eat plenty of food, we shall certainly be inclined to think that the improvement – often a brilliant one – which is achieved in a few weeks or months is due to the rest which she has enjoyed and to the invigorating effects of hydrotherapy. That may be so: but we are overlooking the fact that her removal from home also entails an interruption of marital intercourse, and that it is only the temporary elimination of this pathogenic cause which makes it possible for her to recover under favourable treatment. Neglect of this aetiological point of view brings its subsequent [*nachträglich*] revenge, when what seemed such a gratifying cure turns out to be a very transitory one. Soon after the patient has returned to ordinary life the symptoms of the complaint appear once more and oblige him either to spend a part of his existence [275]
unproductively from time to time in establishments of this kind or to direct his hopes of recovery elsewhere. It is therefore clear that with neurasthenia the therapeutic problems must be attacked, not in hydropathic institutions but within the framework of the patient's life.

In other cases our aetiological theory can help the physician in charge of the institution by throwing light on the source of failures which occur in the institution itself, and can suggest to him means of avoiding them. Masturbation is far commoner among grown-up girls and mature men than is generally supposed, and it has a harmful effect not only by producing neurasthenic symptoms, but also because it keeps the patients under the weight of what they feel to be a disgraceful secret. Physicians who are not accustomed to translate neurasthenia into masturbation account for the patient's pathological state by referring it to some catchword like anaemia, undernourishment, overwork, etc., and then expect to cure him by applying a therapy devised against those conditions. To their astonishment, however, periods of improvement in him alternate

with periods in which all his symptoms grow worse and are accompanied by severe depression. The outcome of such a treatment is, in general, doubtful. If physicians knew that all the while the patient was struggling against his sexual habit and that he was in despair because he had once more been obliged to give way to it, if they understood how to win his secret from him, to make it less serious in his eyes and to support him in his fight against the habit, then the success of their therapeutic efforts might in this way well be assured.

To break the patient of the habit of masturbating is only one of the new therapeutic tasks which are imposed on the physician who takes the sexual aetiology of the neurosis into account; and it seems that precisely this task, like the cure of any other addiction, can only be carried out in an institution and under medical supervision. Left to himself, the masturbator is accustomed, whenever something happens that depresses him, to return to his convenient form of satisfaction. Medical treatment, in this instance, can have no other aim than to lead the neurasthenic, who has now recovered his strength, back to normal sexual intercourse. For
[276] sexual need, when once it has been aroused and has been satisfied for any length of time, can no longer be silenced; it can only be displaced along another path. Incidentally, the same thing applies to all treatments for breaking an addiction. Their success will only be an apparent one, so long as the physician contents himself with withdrawing the narcotic substance from his patients, without troubling about the source from which their imperative need for it springs. 'Habit' is a mere form of words, without any explanatory value. Not everyone who has occasion to take morphia, cocaine, chloral hydrate, and so on, for a period, acquires in this way an 'addiction' to them. Closer enquiry usually shows that these narcotics are meant to serve – directly or indirectly – as a substitute for a lack of sexual satisfaction; and whenever normal sexual life can no longer be re-established, we can count with certainty on the patient's relapse.[1]

Another task is set to the physician by the aetiology of anxiety neurosis. It consists in inducing the patient to give up all detrimental forms of sexual intercourse and to adopt normal sexual relations. This duty, it will be understood, falls primarily on the patient's trusted physician – his

1 [References to masturbation as the source of neurasthenia occur many times in the Fliess letters. See, for instance, Draft B of February 8, 1893 (Freud, 1950*a*). Freud's fullest later remarks on masturbation were made in his contribution to a discussion of the subject in the Vienna Psychoanalytical Society (1912*f*) which showed very little alteration in his views from these earlier ones. Further references can be found in the Editors' Note to this (*RSE*, **12**, 237 f.). Freud's first involvement with problems of addiction is documented in his cocaine papers, briefly abstracted above (1897*b*), and fully discussed in the first volume of Jones's biography (1953) and elsewhere.]

family doctor; and he will do his patient a serious injury if he regards himself as too respectable to intervene in this field.

Since in these instances it is most often a question of a married couple, the physician's efforts at once encounter Malthusian plans for limiting the number of conceptions in marriage. There seems to me no doubt that such proposals are gaining ground more and more among our middle classes. I have come across some couples who have already begun practising methods for preventing conception as soon as they have had their first child, and others whose sexual intercourse was from their wedding night designed to comply with that purpose. The problem of Malthusianism is far-reaching and complicated, and I have no intention of handling it here in the exhaustive manner which would actually be necessary for the treatment of neuroses. I shall only consider what attitude a [277] physician who recognizes the sexual aetiology of the neuroses had best take up towards the problem.

The worst thing he can do is obviously – under whatever pretext – to try to ignore it. Nothing that is necessary can be beneath my dignity as a doctor; and it is necessary to give a married couple who contemplate limiting the number of their offspring the assistance of one's medical advice if one does not want to expose one or both of them to a neurosis. It cannot be denied that in any marriage Malthusian preventive measures will become necessary at some time or other; and, from a theoretical point of view, it would be one of the greatest triumphs of humanity, one of the most tangible liberations from the constraints of nature to which mankind is subject, if we could succeed in raising the responsible act of procreating children to the level of a deliberate and intentional activity and in freeing it from its entanglement with the necessary satisfaction of a natural need.

A perspicacious physician will therefore take it upon himself to decide under what conditions the use of measures for preventing conception are justified, and, among those measures, he will have to separate the harmful from the harmless ones. Everything is harmful that hinders the occurrence of satisfaction. But, as we know, we possess at present no method of preventing conception which fulfils every legitimate requirement – that is, which is certain and convenient, which does not diminish the sensation of pleasure [*Lustempfindung*][T] during coitus and which *Lust* does not wound the woman's sensibilities. This sets physicians a practical task to the solution to which they could bend their energies with rewarding results. Whoever fills in this lacuna in our medical technique will have preserved the enjoyment of life and maintained the health of

numberless people; though, it is true, he will also have paved the way for a drastic change in our social conditions.[1]

[278] This does not exhaust the possibilities which flow from a recognition of the sexual aetiology of the neuroses. The main benefit which we obtain from it for neurasthenics lies in the sphere of prophylaxis. If masturbation is the cause of neurasthenia in youth, and if, later on, it acquires aetiological significance for anxiety neurosis as well, by reason of the reduction of potency which it brings about, then the prevention of masturbation in both sexes is a task that deserves more attention than it has hitherto received. When we reflect upon all the injuries, both the grosser and the finer ones, which proceed from neurasthenia – a disorder which we are told is growing more and more prevalent – we see that it is positively a matter of public interest that *men should enter upon sexual relations with full potency*. In matters of prophylaxis, however, the individual is relatively helpless. The whole community must become interested in the matter and give their assent to the creation of generally acceptable regulations. At present we are still far removed from such a state of affairs which would promise relief, and it is for this reason that we may with justice regard civilization, too, as responsible for the spread of neurasthenia.[2] Much would have to be changed. The resistance of a generation of physicians who can no longer remember their own youth must be broken down; the pride of fathers, who are unwilling to descend to the level of humanity in their children's eyes, must be overcome; and the unreasonable prudery of mothers must be combated – the mothers who at present look upon it as an incomprehensible and undeserved stroke of fate that '*their* children should have been the ones to become neurotic'. But above all, a place must be created in public opinion for the discussion of the problems of sexual life. It will have to become possible to talk about these things without being stamped as a trouble-maker or as a person who makes capital out of base instincts [*Instinkte*][T]. And so here, too, there is enough work left to do for the next hundred years – in which our civilization will have to learn to come to terms with the claims of our sexuality.

The value of making a correct diagnostic separation of the psychoneuroses from neurasthenia is also shown by the fact that the psychoneuroses call for a different practical assessment and for special

1 [Freud returned to the problem of the use of contraceptives in his paper on '"Civilized" Sexual Morality' (1908*d*), *RSE*, **9**, 169. He had already discussed it several times in his letters to Fliess, going back at least as early as one dated February 8, 1893 (Freud, 1950*a*, Draft B). Cf. p. 148 *n*. 2 above. See also Freud (1910–11*a*), *RSE*, **12**, 341.]

2 [See above, p. 266.]

therapeutic measures. They make their appearance as a result of two kinds of determinants, either independently or in the train of the 'actual neuroses'[1] (neurasthenia and anxiety neurosis). In the latter case we are dealing with a new type of neurosis – incidentally, a very frequent one – a mixed neurosis. The aetiology of the 'actual neuroses' has become an auxiliary aetiology of the psychoneuroses. A clinical picture arises in which, let us say, anxiety neurosis predominates but which also contains traits of genuine neurasthenia, hysteria and obsessional neurosis. When confronted with a mixture of this kind, we shall nevertheless not be wise to give up separating out the clinical pictures proper to each neurotic illness; for after all it is not difficult to explain the case to oneself in the following manner. The predominant place taken by the anxiety neurosis shows that the illness has come into being under the aetiological influence of an 'actual' [i.e. present-day] sexual noxa. But the person concerned was, apart from that, disposed to one or more of the psychoneuroses owing to a special aetiology and would at some time or other have fallen ill of a psychoneurosis either spontaneously or with the advent of some other weakening factor. In this way the auxiliary aetiology for the psychoneurosis which is still lacking is supplied by the actual [current] aetiology of the anxiety neurosis.[2] [279]

For such cases it has quite correctly come to be the therapeutic practice to disregard the psychoneurotic components in the clinical picture and to treat the 'actual neurosis' exclusively. In very many cases it is possible to overcome the [psycho]neurosis as well which it has brought along with it, provided that the neurasthenia is effectively dealt with. But a different view must be taken in those cases of psychoneurosis which either appear spontaneously or remain behind as an independent entity after an illness composed of neurasthenia and psychoneurosis has run its course. When I speak of a 'spontaneous' appearance of a psychoneurosis, I do not mean that anamnestic investigation shows us no aetiological element whatever. It may do so, no doubt; but it may also happen that our attention is directed to some indifferent factor – an emotional state, an enfeeblement owing to physical illness, and so on. It [280]

1 [Cf. p. 265 above. This is the first occurrence of the exact technical term, though the concept was an old one. The distinction between the 'actual' neuroses and the psychoneuroses is implied, for instance, in Freud's contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 228 ff.; and it is stated more clearly in the second paper on the neuropsychoses of defence (1896*b*), p. 177 f. above, where the 'actual' neuroses are termed the 'simple' neuroses. At this period Freud often referred to them as 'the neuroses' without qualification. (Cf. the early lecture (1893*h*), p. 37 above.) A list of later references to the 'actual' neuroses is given in an Editors' footnote to the paper on '"Wild" Psychoanalysis' (1910*k*), *RSE*, **11**, 216 *n.* 1.]

2 [Freud had pointed this out less fully above, p. 178.]

must, however, be borne in mind in all these cases that the true aetiology of the psychoneuroses does not lie in such precipitating causes, but remains beyond the reach of ordinary anamnestic examination.

As we know, it is in an attempt to bridge this gap that the assumption has been made of a special neuropathic disposition (which, incidentally, if it existed, would not leave much hope of success for the treatment of such pathological conditions). The neuropathic disposition itself is regarded as a sign of a general degeneracy, and thus this convenient technical term has come to be superabundantly used against the wretched patients whom the doctors are quite incapable of helping. Fortunately, the state of affairs is different. The neuropathic disposition does no doubt exist, but I must deny that it suffices for the creation of a psychoneurosis. I must further deny that the conjunction of a neuropathic disposition with precipitating causes occurring in later life constitutes an adequate aetiology of the psychoneuroses. In tracing back the vicissitudes of an individual's illness [*Krankheitsschicksale*][T] to the experiences of his ancestors, we have gone too far; we have forgotten that between his conception and his maturity there lies a long and important period of life – his childhood – in which the seeds of later illness may be acquired. And that is what in fact happens with a psychoneurosis. Its true aetiology is to be found in childhood experiences, and, once again – and exclusively – in impressions concerned with sexual life. We do wrong to ignore the sexual life of children entirely; in my experience, children are capable of every psychical sexual activity, and many somatic sexual ones as well. Just as the whole human sexual apparatus is not comprised in the external genitals and the two reproductive glands, so human sexual life does not begin only with puberty, as on a rough inspection it may appear to do. Nevertheless, it is true that the organization and evolution of the human species strives to avoid any great degree of sexual activity during childhood. It seems that in man the sexual drive forces [*Triebkräfte*][T] are meant to be stored up so that, on their release at puberty, they may serve great cultural [*kulturellen*][T] ends. (W. Fliess.) Consideration of this sort may make it possible to understand why the sexual experiences of childhood are bound to have a pathogenic effect. But they produce their effect only to a very slight degree at the time at which they occur; what is far more important is their *deferred* [*nachträgliche*][T] effect, which can only take place at later periods of growth. This deferred effect originates – as it can do in no other way – in the psychical traces which have been left behind by infantile sexual experiences. During the interval between the experiences of those impressions and their reproduction (or rather, the

Schicksal

[281]

Trieb

Kultur

Nachträglichkeit

reinforcement of the libidinal impulses [*Impulse*] which proceed from them), not only the somatic sexual apparatus [*Sexualapparat*] but the psychical apparatus [*psychische Apparat*][T] as well has undergone an important development; and thus it is that the influence of these earlier sexual experiences now leads to an abnormal psychical reaction, and psychopathological structures [*Bildungen*][T] come into existence.

I can do no more in these brief hints than mention the chief factors on which the theory of the psychoneuroses is based: the deferred nature of the effect [*die Nachträglichkeit*] and the infantile state of the sexual apparatus [*Geschlechtsapparates*] and of the mental instrument [*Seelen-instrument*][T]. To reach a true understanding of the mechanism by which the psychoneuroses come about, a more extended exposition would be necessary. Above all, it would be indispensable to put forward as worthy of belief certain hypotheses, which seem to me to be new, about the composition and mode of operation of the psychical apparatus. In a book on the interpretation of dreams on which I am now engaged I shall find occasion to touch upon those fundamental elements of a psychology of the neuroses. For dreams belong to the same set of psychopathological structures [*Bildungen*] as hysterical *idées fixes*, obsessions and delusions.[2]

Since the manifestations of the psychoneuroses arise from the deferred action [*Nachträglichkeit*] of unconscious psychical traces, they are accessible to psychotherapy. But in this case the therapy must pursue paths other than the only one so far followed of suggestion with or with- [282]
out hypnosis. Basing myself on the 'cathartic' method introduced by Josef Breuer, I have in recent years almost completely worked out a therapeutic procedure which I propose to describe as '*psychoanalytic*'. I owe a great number of successes to it, and I hope I may be able further to increase its effectiveness considerably. The first accounts of the technique and scope of this method were given in *Studies on Hysteria*, written jointly with Breuer and published in 1895. Since then a good deal, as I think I may say, has been altered for the better. Whereas at that time we modestly declared that we could undertake only to remove the symptoms of hysteria, not to cure hysteria itself,[3] this distinction has since come to seem to me without substance, so that there is a prospect of a genuine cure of hysteria and obsessions. It is therefore with very lively

1 [The first appearance of this term.]

2 [Freud's *The Interpretation of Dreams* (1900*a*), published less than two years after this paper, contained in its seventh chapter the first full publication of his views on the structure and function of the 'psychical apparatus'.]

3 [Cf. the closing sentences of Freud's early lecture (1893*h*), p. 37 above.]

interest that I have read in the publications of colleagues that 'in this case the ingenious procedure devised by Breuer and Freud has failed' [*versagt*][T], or that 'the method has not performed what it seemed to promise'. This gave me something of the feelings of a man who reads his own obituary in the paper, but who is able to reassure himself by his better knowledge of the facts. For the method is so difficult that it has quite definitely to be learnt; and I cannot recall that a single one of my critics has expressed a wish to learn it from me. Nor do I believe that, like me, they have occupied themselves with it intensely enough to have been able to discover it for themselves. The remarks in the *Studies on Hysteria* are totally inadequate to enable a reader to master the technique, nor are they in any way intended to give any such complete instruction.

Versagung

Psychoanalytic therapy is not at present applicable to all cases. It has, to my knowledge, the following limitations. It demands a certain degree of maturity and understanding in the patient and is therefore not suited for the young or for adults who are feeble-minded or uneducated. It also fails with people who are very advanced in years, because, owing to the accumulation of material in them, it would take up so much time that by the end of the treatment they would have reached a period of life in which value is no longer attached to nervous health. Finally, the treatment is only possible if the patient has a normal psychical state from which the pathological material can be mastered. During a condition of hysterical confusion, or an interpolated mania or melancholia, nothing can be effected by psychoanalytic means. Such cases can nevertheless be treated by analysis after the violent manifestations have been quieted by the usual measures. In actual practice, chronic cases of psychoneurosis are altogether more amenable to the method than cases with acute crises, in which the greatest stress is naturally laid on the speed with which the crises can be dealt with. For this reason, the most favourable field of work for this new therapy is offered by hysterical phobias and the various forms of obsessional neurosis.

[283]

That the method is confined within these limits is to a large extent explained by the circumstances in which I had to work it out. My material does in fact consist of chronic nervous cases derived from the more educated classes. I think it very probable that supplementary methods may be devised for treating children and the public who go for assistance to hospitals. I ought also to say that up to the present I have tried my treatment exclusively on *severe* cases of hysteria and obsessional neurosis; I cannot tell how it would turn out with those mild cases which, to all appearance at least, are cured by some unspecific kind of treatment

lasting for a few months. It will readily be understood that a new therapy which calls for many sacrifices can only reckon on obtaining patients who have already tried the generally accepted methods without success, or whose condition has justified the inference that they could expect nothing from these supposedly more convenient and shorter therapeutic procedures. Thus it happened that I was obliged to tackle the hardest tasks straight away with an imperfect instrument. The test has proved all the more convincing.

The main difficulties which still stand in the way of the psychoanalytic method of cure are not due to itself but to the lack of understanding among doctors and laymen of the nature of the psychoneuroses. It is no more than a necessary corollary to this complete ignorance that doctors consider themselves justified in using the most unfounded assurances for the consolation of their patients or in order to induce them to adopt therapeutic measures. 'Come to my sanatorium for six weeks', they will say, 'and you will get rid of your symptoms' (travel anxiety, obsessions, [284] and so on). Sanatoria are, it is true, indispensable for calming acute attacks that may arise in the course of a psychoneurosis by diverting the patient's attention, nursing him and taking care of him. But towards removing chronic conditions they achieve precisely nothing: and the superior sanatoria, which are supposed to be conducted on scientific lines, do no more than the ordinary hydropathic establishments.

It would be more dignified as well as more helpful to the patient – who, after all, has to come to terms with his ailments – for the doctor to tell the truth, as he knows it from his daily practice. The psychoneuroses as a genus are by no means mild illnesses. When hysteria sets in, no-one can foretell when it will come to an end. We mostly comfort ourselves with the vain prophecy that 'one day it will suddenly disappear'. Recovery often enough turns out to be merely an agreement to mutual toleration between the sick part of the patient and the healthy part; or it is the result of the transformation of a symptom into a phobia. A girl's hysteria, calmed down with difficulty, revives in her as a wife after the short interruption of young married happiness. The only difference is that another person, the husband, is now driven by his own interests to keep silence about her condition. Even if an illness of this kind leads to no manifest incapacity on the patients' part to carry on their life, it nearly always prevents free unfolding of their mental powers. Obsessions recur throughout their lives; and phobias and other restrictions upon the will have hitherto been unamenable to treatment of any kind. All this is kept from the knowledge of the layman. The father of a hysterical girl is

consequently horrified if, for instance, he is asked to agree to her being given a year's treatment, when she has perhaps been ill for only a few months. The layman is, as it were, deeply convinced in himself that all these psychoneuroses are unnecessary; so he has no patience with the processes of the illness and no readiness to make sacrifices for its treatment. If, in the face of a case of typhus which lasts three weeks, or of a broken leg which takes six months to mend, he adopts a more understanding attitude, and if, as soon as his child shows the first signs of a curvature of the spine, he finds it reasonable that orthopaedic treatment should be carried on over several years, the difference in his behaviour is due to the better knowledge on the part of the physicians who pass on
[285] their knowledge honestly to the layman. Honesty on the part of the physician and willing acquiescence on the part of the layman will be established for the neuroses too, as soon as an insight into the nature of those affections becomes common property in the medical world. Radical treatment of these disorders will no doubt always require special training and will be incompatible with other kinds of medical activity. On the other hand, this class of physicians, which will, I believe, be a large one in the future, has the prospect of achieving noteworthy results and of obtaining a satisfying insight into the mental life of mankind.

THE PSYCHICAL MECHANISM OF FORGETFULNESS

(1898)

ZUM PSYCHISCHEN MECHANISMUS DER VERGESSLICHKEIT

GERMAN EDITIONS

1898 *Mschr. Psychiat. Neurol.*, **4** (6), 436–43. (December.) [288]
1952 *GW*, **1**, 519–27.

ENGLISH TRANSLATION

'The Psychical Mechanism of Forgetfulness'
1962 *SE*, **3**, 289–97. (Tr. A. Strachey.)

The present translation is a revised and corrected reprint of the 1962 version.

This is Freud's first publication on what came to be known as 'parapraxes'. Together with the next paper, it represents the first theoretical yield from an application of the psychoanalytic method to general psychological problems.

The episode which is the subject of this paper occurred during Freud's visit to the Adriatic coast in September, 1898. He sent a short account of it to Fliess on his return to Vienna in a letter dated September 22 (Freud, 1950*a*, Letter 96), and reported a few days later (September 27, ibid., Letter 97) that he had sent this paper off to the journal in which it appeared soon afterwards. This was the first published history of a parapraxis, and Freud made it the basis of the opening chapter of his longer work on the subject three years later (1901*b*); the Editors' Introduction to this (*RSE*, **6**) discusses the whole matter more fully. The present paper was reprinted only after Freud's death, more than fifty years after its first publication. It had been generally assumed, on the basis of Freud's remarks at the beginning of the first chapter of *The Psychopathology of Everyday Life*, ibid., **6**, 1, that what was in question was no more than a rough draft of the later version. An actual comparison of the two works now shows that only the main lines of the topic are the same, that the chain of argument is differently arranged here, and that at one or two points the material is amplified.

THE PSYCHICAL MECHANISM OF FORGETFULNESS

The phenomenon of forgetfulness, which I should like to describe and [289]
then go on to explain in this paper, has doubtless been experienced by everyone in himself or been observed by him in others. It affects in particular the use of proper names – *nomina propria* – and it manifests itself in the following manner. In the middle of carrying on a conversation we find ourselves obliged to confess to the person we are talking to that we cannot hit on a name we wanted to mention at that moment, and we are forced to ask for his – usually ineffectual – help. 'What *is* his name? I know it so well. It's on the tip of my tongue. Just this minute it's escaped me.' An unmistakable feeling of irritation [*ärgerliche Erregung*], similar *Erregung*
to that which accompanies motor aphasia,[1] now attends our further efforts to find the name, which we feel we had in our head only a moment before. In appropriate instances two accompanying features deserve our notice. First, an energetic deliberate concentration of the function which we call attention proves powerless, however long it is continued, to find the lost name. Secondly, in place of the name we are looking for, another name promptly appears, which we recognize as incorrect and reject, but which persists in coming back. Or else, instead of a substituted name, we find in our memory a single letter or syllable, which we recognize as parts of the name we are in search of. We say, for instance: 'It begins with a "B".' If we finally succeed, in one way or another, in discovering what the name is, we find in the great majority of cases that it does not begin with a 'B' and does not in fact contain the letter 'B' at all.[2]

The best procedure for getting hold of the missing name is, as is generally known, 'not to think of it' – that is, to divert from the task that part of the attention over which one has voluntary control. After a while, the missing name 'shoots' into one's mind; one cannot prevent oneself from [290]
calling it out aloud – to the great astonishment of one's companion, who

1 [Word-finding difficulty and anomia are common aphasic symptoms (cf. Freud, 1891*b*; *NSW*, **4**).]

2 [Freud enlarges a little on this in Chapter V of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 47 f.]

has already forgotten the episode and who has in any case taken only very little interest in the speaker's efforts. 'Really,' he is apt to say, 'it makes no difference *what* the man is called; only go on with your story.' The whole of the time until the matter is cleared up, and even after the intentional diversion [of one's attention], one feels preoccupied to a degree which cannot in fact be explained by the amount of interest possessed by the whole affair.[1]

In a few cases which I have myself experienced of forgetting names in this way, I have succeeded, by means of psychical analysis, in accounting to myself for the chain of events; and I shall now describe in detail the simplest and clearest case of this kind.

During my summer holidays I once went for a carriage drive from the lovely city of Ragusa[2] to a town nearby in Herzegovina. Conversation with my companion centred, as was natural, on the condition of the two countries (Bosnia and Herzegovina) and the character of their inhabitants. I talked about the various peculiarities of the Turks living there, as I had heard them described years before by a friend and colleague who had lived among them as a doctor for many years. A little later, our conversation turned to the subject of Italy and of pictures, and I had occasion to recommend my companion strongly to visit Orvieto some time, in order to see the frescoes there of the end of the world and the Last Judgement, with which one of the chapels in the cathedral had been decorated by a great artist. But the artist's name escaped me and I could not recall it. I exerted my powers of recollection, made all the details of the day I spent in Orvieto pass before my memory and convinced myself that not the smallest part of it had been obliterated or become indistinct. On the contrary, I was able to conjure up the pictures with greater sensory vividness
[291] than is usual with me.[3] I saw before my eyes with special sharpness the

Unlust Hemmung

1 Nor by any feeling of unpleasure [*Unlustgefühl*]^{T} one may have at being inhibited [*Gehemmtseins*]^{T} in a psychical act.

2 [Now Dubrovnik. Freud's companion on the drive was a Berlin lawyer named Freyhau (Freud, 1950*a*, Letter 96).]

3 [Freud is here drawing attention to an observation that, when a memory is repressed, there often emerges into consciousness *with unusual vividness* an image of something which is not the repressed memory itself but which, though unimportant and irrelevant, is closely related to the repressed memory. Another instance of this is mentioned at the end of the present paper (p. 289 f. below), and a similar one in the paper on 'Screen Memories' (1899*a*) which follows this one (p. 303 f.). In a footnote to *The Psychopathology of Everyday Life* (1901*b*), where the present instance reappears (*RSE*, **6**, 12 *n.*), Freud suggests an explanation of this phenomenon; and other examples appear in the same volume (ibid., **6**, 229 and 36), added to the work in 1907 and 1920 respectively. In one of his very last papers, on 'Constructions in Analysis' (1937*d*, Section III), Freud once again takes up the question and relates it to the general problem of hallucinations. In all of these examples he uses the German word '*überdeutlich*', which is here translated 'ultra-clear'.]

artist's self-portrait – with a serious face and folded hands – which he has put in a corner of one of the pictures, next to the portrait of his predecessor in the work, Fra Angelico da Fiesole; but the artist's name, ordinarily so familiar to me, remained obstinately in hiding, nor could my travelling companion help me out. My continued efforts met with no success beyond bringing up the names of two other artists, who I knew could not be the right ones. These were *Botticelli* and, in the second place, *Boltraffio*.[1] The repetition of the sound 'Bo' in the two substitutive names might perhaps have led a novice to suppose that it belonged to the missing name as well, but I took good care to steer clear of that expectation.

Since I had no access to any reference books on my journey, I had for several days to put up with this lapse of memory and with the inner torment associated with it which recurred at frequent intervals each day, until I fell in with a cultivated Italian who freed me from it by telling me the name: *Signorelli*. I was myself able to add the artist's *first* name, *Luca*. Soon my ultra-clear memory of the master's features, as depicted in his portrait, faded away.

What influences had led me to forget the name *Signorelli*, which was so familiar to me and which is so easily impressed on the memory? And what paths had led to its replacement by the names *Botticelli* and *Boltraffio*? A short excursion back into the circumstances in which the [292] forgetting had taken place sufficed to throw a light on both questions.

Shortly before I had come to the subject of the frescoes in the cathedral at Orvieto, I had been telling my travelling companion something I had heard from my colleague years ago about the Turks in Bosnia. They treat doctors with special respect and they show, in marked contrast to our own people, an attitude of resignation towards the dispensations of fate. If the doctor has to inform the father of a family that one of his relatives is about to die, his reply is: '*Herr* [Sir], what is there to be said? If he could be saved, I know you would help him.' Another recollection lay in my memory close to this story. The same colleague had told me what overriding importance these Bosnians attached to sexual enjoyments. One of his patients said to him once: '*Herr*, you must know, that if *that* comes to an end then life is of no value.' At the time, it seemed to the doctor and me that the two character traits of the Bosnian people illustrated by this could be assumed to be intimately connected with each other. But when I remembered these stories on my drive into Herzegovina, I suppressed the second one, in which the subject of sexuality was touched on. It was

1 The first of these names was very familiar to me; the second, on the other hand, I hardly knew.

soon after this that the name *Signorelli* escaped me and that the names *Botticelli* and *Boltraffio* appeared as substitutes.

Verdrängung

The influence which had made the name *Signorelli* inaccessible to memory, or, as I am accustomed to say, had 'repressed' [*verdrängt*][T] it, could only proceed from the story I had suppressed about the value set on death and sexual enjoyment. If that was so, we ought to be able to discover the intermediate ideas which had served to connect the two themes. The affinity between their *content* – in the one case, the Last Judgement, 'Doomsday', and in the other, death and sexuality – seems to be very slight; and since the matter concerned the repression from memory of a *name*, it was on the face of it probable that the connection was between one name and another. Now, '*Signor*' means '*Herr*' [Sir], and the '*Herr*' is also present in the name '*Her*zegovina'. Moreover, it was certainly not without relevance that both the patients' remarks which I was to recall contained a '*Herr*' as a form of address to the doctor. The translation of '*Signor*' into '*Herr*' was therefore the means by which the story that I had [293] suppressed had drawn after it into repression the name I was looking for. The whole process was clearly made easier by the fact that during the last few days in Ragusa I had been speaking Italian continually – that is, that I had become accustomed to translating German into Italian in my head.[1]

When I tried to recover the name of the artist, to bring it back out of repression, the influence of the tie which the name had entered into in the meantime inevitably made itself felt. I did find an artist's name, but not the right one. It was a displaced name, and the line of displacement was laid down by the names that were contained in the repressed topic. 'Botti*celli*' contains the same final syllables as 'Signor*elli*'; the final syllables – which, unlike the first part of the word, '*Signor*', could not make a direct connection with the name 'Herzegovina' – had therefore returned; but the influence of the name 'Bosnia', which is regularly associated with the name 'Herzegovina',[2] had shown itself by directing the substitution to two artists' names which began with the same syllable 'Bo': 'Botticelli' and then 'Boltraffio'. The finding of the name 'Signorelli'

1 'A far-fetched, forced explanation', it will be said. This impression is bound to arise because the suppressed topic struggles by every possible means to establish a connection with what is not suppressed; and for this purpose it does not scorn even the path of external association. There is the same 'forced' situation when rhymes have to be made. [The stress under which rhyming verse has to be constructed was described by Freud in Chapter VI (D) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 304. – By an 'external association' is meant a superficial one, e.g. by phonological similarity without any semantic connection.]

2 [The two provinces were constantly mentioned together owing to their geographical and historical links.]

is thus seen to have been interfered with by the topic which lay behind it, in which the names 'Bosnia' and 'Herzegovina' appear.

For this topic to have been able to produce such effects it is not enough that I should have suppressed it once in conversation – an event brought about by chance motives [*Motive*][T]. We must assume rather that the topic itself was also intimately bound up with trains of thought which were in a state of repression in me – that is, with trains of thought which, in spite of the intensity of the interest taken in them, were meeting with a resistance that was keeping them from being worked over by a particular psychical agency and thus from becoming conscious. That this was really [294]
true at that time of the topic of 'death and sexuality' I have plenty of evidence, which I need not bring up here, derived from my own self-investigation. But I may draw attention to one consequence of these repressed thoughts. Experience has taught me to require that every psychical product shall be fully elucidated and even overdetermined. Accordingly, it seemed to me that the second substitutive name, 'Boltraffio', called for a further determination; for so far only its initial letters had been accounted for, by their assonance with 'Bosnia'. I now recollected that these repressed thoughts had never engrossed me more than they had a few weeks before, after I had received a certain piece of news.[1] The place where the news reached me was called '*Trafoi*' and this name is too much like the second half of the name 'Boltraffio' not to have had a determining effect on my choice of the latter. In the following small schematic diagram [Fig. 1], I have attempted to reproduce the relations which have now been brought to light.

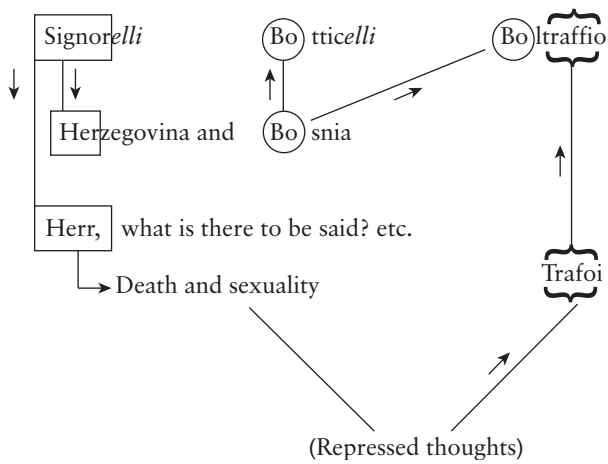

Fig. 1.

1 [The news of the suicide of one of his patients 'on account of an incurable sexual disorder'. See *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 3. Trafoi is a village in the Tyrol.]

[295] It is perhaps not without interest for its own sake to be able to see into the history of a psychical event of this kind, which is among the most trivial disturbances that can affect the control of the psychical apparatus [*psychische Apparates*] and which is compatible with an otherwise untroubled state of psychical health. But the example elucidated here receives an immensely added interest when we learn that it may serve as nothing more nor less than a model for the pathological processes to which the psychical symptoms of the psychoneuroses – hysteria, obsessions and paranoia – owe their origin. In both cases we find the same *Kraft* elements and the same play of forces [*Kräftspiel*]^{T} between those elements. In the same manner as here and by means of similar superficial associations, a repressed train of thought takes possession in neuroses of an innocent recent impression and draws it down with itself into repression. The same mechanism which causes the substitute names 'Botticelli' and 'Boltraffio' to emerge from 'Signorelli' (a substitution by means of intermediate or compromise ideas) also governs the formation [*Bildung*]^{T} of obsessional thoughts and paranoic paramnesias. Again, we have seen that such cases of forgetfulness have the characteristic of liberating continuous unpleasure till the moment the problem is solved – a characteristic which is unintelligible apart from this, and something which [in the instance I have quoted] was in fact unintelligible to the person I was talking to [p. 284 above]; but there is a complete analogy to it in the way in which collections of repressed thoughts attach their capacity for producing affect to some symptom whose psychical content seems to our judgement totally unsuited to such a liberation of affect. Finally, the resolution of the whole tension by a communication of the correct name from an external quarter is itself a good example of the efficacy of psychoanalytic therapy, which aims at correcting the repressions and displacements [*Verschiebungen*]^{T} and which removes the symptoms by reinstating the genuine psychical object.[1]

Among the various factors, therefore, which contribute to a failure in recollection or a loss of memory, the part played by repression must not be overlooked; and it can be demonstrated not only in neurotics but (in a manner that is qualitatively the same) in normal people as well. It may [296] be asserted quite generally that the ease (and ultimately the faithfulness, too) with which a given impression is awakened in the memory depends not only on the psychical constitution of the individual, the strength of

1 [The comparison between the mechanism of parapraxes and of neurotic symptoms had been very briefly indicated in a letter from Freud to Fliess of August 26, 1898 (Freud, 1950*a*, Letter 94). This letter is quoted in the Editors' Introduction to *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, xv *n.* 3.]

the impression when it was fresh, the interest directed towards it at the time, the psychical constellation at the present time, the interest that is *now* devoted to its awakening, the connections into which the impression has been drawn, and so on – not only on such things but also on the favourable or unfavourable attitude of a particular psychical factor which refuses to reproduce anything that might liberate unpleasure, or that might subsequently lead to the liberation of unpleasure. Thus the function of memory, which we like to regard as an archive open to anyone who is curious, is in this way subjected to restriction by a trend of the will, just as is any part of our activity directed to the external world. Half the secret of hysterical amnesia is uncovered when we say that hysterical people do not know what they do not *want* to know; and psychoanalytic treatment, which endeavours to fill in such gaps of memory in the course of its work, leads us to the discovery that the bringing back of those lost memories is opposed by a certain resistance [*Widerstand*] which has to be counterbalanced by work proportionate to its magnitude. In the case of psychical processes which are on the whole normal, it cannot, of course, be claimed that the influence of this one-sided factor in the revival of memories in any way regularly overcomes all the other factors that must be taken into account.[1]

In connection with the tendentious nature of our remembering and forgetting, I not long ago experienced an instructive example – instructive because of what it betrayed – of which I should like to add an account [297]
here. I was intending to pay a twenty-four-hour visit to a friend of mine who unfortunately lives very far away, and I was full of the things I was going to tell him. But before this I felt under an obligation to call on a family of my acquaintance in Vienna, one of whose members had moved to the town in question, so as to take their greetings and messages with me to the absent relative. They told me the name of the pension in which he lived, and also the name of the street and the number of the house, and, in view of my bad memory, wrote the address on a card, which I put in my wallet. The next day, when I had arrived at my friend's, I began: 'I've only one duty to carry out that may interfere with our being

1 It would be a mistake to believe that the mechanism which I have brought to light in these pages only operates in rare cases. It is, on the contrary, a very common one. On one occasion, for instance, when I was meaning to describe the same small incident to a colleague of mine, the name of my authority for the stories about Bosnia suddenly escaped me. The reason for this was as follows. Just before, I had been playing cards. My [Bosnian] authority was called Pick. Now '*Pick*' and '*Herz*' ['Spades' and 'Hearts'] are two of the four suits in the pack. Moreover, the two words were connected by an anecdote in which this same person pointed to himself and said: 'I'm not called "*Herz*", but "*Pick*".' '*Herz*' appears in the name '*Herzegovina*' and the heart itself, as a sick bodily organ, played a part in the thoughts I have described as having been repressed.

together; it's a call, and it shall be the first thing I do. The address is in my wallet.' To my astonishment, however, it was not to be found there. So now I had to fall back on my memory, after all. My memory for names is not particularly good, but it is incomparably better than for figures and numbers. I may have been paying medical visits at a certain house for a year on end, and yet, if I should have to be driven there by a cab driver, I should have difficulty in remembering the number of the house. But in this case I had taken special note of the house number; it was ultra-clear,[1] as if to jeer at me – for no trace remained in my recollection of the name of the pension or the street. I had forgotten all the data in the address which might have served as a starting point for discovering the pension; and, quite against my usual habit, I had retained the number of the house, which was useless for the purpose. In consequence, I was unable to make the call. I was consoled remarkably quickly, and I devoted myself entirely to my friend. When I was back again in Vienna and standing in front of my writing desk, I knew without a moment's hesitation where it was that, in my 'absent-mindedness', I had put the card with the address on it. In my unconscious hiding of the thing the same intention had been operative as in my curiously modified act of forgetting.[2]

1 [See footnote 3, p. 284 above.]

2 [This anecdote is told much more concisely in a footnote to Chapter II of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 12 *n.*]

A letter of Freud's to Fliess of May 25, 1899, tells him that on that date this paper was sent in to the editor of the periodical in which it appeared later in the year. He adds that he was immensely pleased by it during its production, which he takes as a bad omen for its future fate.

The concept of 'screen memories' was here introduced by Freud for the first time. It was no doubt brought into focus by his consideration of the particular instance which occupies the major part of the paper and which had been alluded to in a letter to Fliess of January 3, 1899 (Letter 101). Nevertheless, the topic was closely related to several others which had been occupying his mind for many months previously – in fact, ever since he had embarked on his self-analysis in the summer of 1897 – problems concerning the operation of memory and its distortions, the importance and raison d'être of phantasies, the amnesia covering our early years, and, behind all this, infantile sexuality. Readers of the Fliess letters will find many approaches to the present discussion. See, for instance, the remarks on phantasies in Draft M of May 25, 1897, and in Letter 66 of July 7, 1897. The screen memories analysed by Freud at the end of Chapter IV of the 1907 edition of *The Psychopathology of Everyday Life* [302] (1901*b*) go back to this same summer of 1897.

It is a curious thing that the type of screen memory mainly considered in the present paper – one in which an early memory is used as a screen for a later event – almost disappears from later literature. What has since come to be regarded as the regular

type – one in which an early event is screened by a later memory – is only barely alluded to here, though it was already the one almost exclusively dealt with by Freud only two years later, in the chapter of *The Psychopathology of Everyday Life* just mentioned. (See also footnote, p. 312 below.)

The intrinsic interest of this paper has been rather undeservedly overshadowed by an extraneous fact. It was not difficult to guess that the incident described in it was in fact an autobiographical one, and this became a certainty after the appearance of the Fliess correspondence. Many of the details, however, can be traced in Freud's published writings. Thus, the children in the screen memory were in fact his nephew John and his niece Pauline, who appear at several points in *The Interpretation of Dreams* (1900*a*). (Cf., for instance, *RSE*, **5**, 379, 431 f. and 434 f.) These were the children of his much older half-brother, who is mentioned in Chapter X of *The Psychopathology of Everyday Life* (1901*b*), ibid., **6**, 196. This brother, after the break-up of the family at Freiberg when Freud was three, had settled in Manchester, where Freud visited him at the age of nineteen – not twenty, as is implied here (p. 305 below) – a visit alluded to in the same passage in *The Psychopathology of Everyday Life* and also in *The Interpretation of Dreams* (ibid., **5**, 464). His age at the time of his first return to Freiberg was also a year less than is represented here. He was sixteen, as he tells us in 'Letter to the Burgomaster of Příbor' (1931*e*), ibid., **21**, 252. We learn from this source too that the family with whom he stayed was named Fluss, and it was one of the daughters of this family, Gisela, who was the central figure of the present anecdote. The episode is fully described in the first volume of Ernest Jones's biography (1953, 27–9 and 35–7).[1]

1 The name of Gisela Fluss makes an unexpected and quite unimportant appearance in Freud's notes on the 'Rat Man' analysis (1955*a*), *RSE*, **10**, 210.

SCREEN MEMORIES

In the course of my psychoanalytic treatment of cases of hysteria, obsessional neurosis [*Zwangsneurose*][T], etc., I have often had to deal with fragmentary recollections which have remained in the patient's memory from the earliest years of his childhood. As I have shown elsewhere,[1] great pathogenic importance must be attributed to the impressions of that time of life. But the subject of childhood memories is in any case bound to be of psychological interest, for they bring into striking relief a fundamental difference between the psychical functioning of children and of adults. No-one calls in question the fact that the experiences of the earliest years of our childhood leave ineradicable traces in the depths of our minds [*Seeleninnern*][T]. If, however, we seek in our *memories* to ascertain what were the impressions that were destined to influence us to the end of our lives, the outcome is either nothing at all or a relatively small number of isolated recollections which are often of dubious or enigmatic importance. It is only from the sixth or seventh year onwards – in many cases only after the tenth year – that our lives can be reproduced in memory as a connected chain of events. From that time on, however, there is also a direct relation between the psychical significance of an experience and its retention in the memory. Whatever seems important on account of its immediate or directly subsequent effects is recollected; whatever is judged to be inessential is forgotten. If I can remember an event for a long time after its occurrence, I regard the fact of having retained it in my memory as evidence of its having made a deep impression on me at the time. I feel surprised at forgetting something important; and I feel even more surprised, perhaps, at remembering something apparently indifferent.

[303]

Zwang

Seele

It is only in certain pathological mental conditions that the relation holding in normal adults between the psychical significance of an event and its retention in memory once more ceases to apply. For instance, a hysteric habitually shows amnesia for some or all of the experiences

1 [Cf., for instance, 'The Aetiology of Hysteria' (1896), p. 209 f. above.]

[304] which led to the onset of his illness and which from that very fact have become important to him and, apart from that fact, may have been important on their own account. The analogy between pathological amnesia of this kind and the normal amnesia affecting our early years seems to me to give a valuable hint at the intimate connection that exists between the psychical content of neuroses and our infantile life.

We are so much accustomed to this lack of memory of the impressions of childhood that we are apt to overlook the problem underlying it and are inclined to explain it as a self-evident consequence of the rudimentary character of the mental activities of children. Actually, however, a normally developed child of three or four already exhibits an enormous amount of highly organized mental capabilities [*Seelenleistungen*] in the comparisons and inferences which he makes and in the expression of his feelings; and there is no obvious reason why amnesia should overtake these psychical acts, which carry no less weight than those of a later age.

Before dealing with the psychological problems attaching to the earliest memories of childhood, it would of course be essential to make a collection of material by surveying a fairly large number of normal adults and discovering what kind of recollections they are able to produce from these early years. A first step in this direction was taken in 1895 by V. and C. Henri, who sent round a paper of questions drawn up by them. The highly suggestive results of their questionnaire, which brought in replies from 123 persons, were published by the two authors in 1897. I have no intention at present of discussing the subject as a whole, and I shall therefore content myself with emphasizing the few points which will enable me to introduce the notion of what I have termed 'screen memories' [*Deckerinnerungen*][T].

The age to which the content of the earliest memories of childhood is usually referred back is the period between the ages of two and four. (This is the case with 88 persons in the series observed by the Henris.) There are some, however, whose memory reaches back further – even to the time before the completion of their first year; and, on the other hand, there are some whose earliest recollections go back only to their sixth, seventh, or even eighth year. There is nothing at the moment to show
[305] what else is related to these individual differences; but it is to be noticed, say the Henris, that a person whose earliest recollection goes back to a very tender age – to the first year of his life, perhaps – will also have at his disposal further detached memories from the following years, and that he will be able to reproduce his experiences as a continuous chain from

an earlier point of time – from about his fifth year – than is possible for other people, whose first recollection dates from a later time. Thus not only the date of the appearance of the first recollection but the whole function of memory may, in the case of some people, be advanced or retarded.

Quite special interest attaches to the question of what is the usual *content* of these earliest memories of childhood. The psychology of adults would necessarily lead us to expect that those experiences would be selected as worth remembering which had aroused some powerful emotion or which, owing to their consequences, had been recognized as important soon after their occurrence. And some indeed of the observations collected by the Henris appear to fulfil this expectation. They report that the most frequent content of the first memories of childhood are on the one hand occasions of fear, shame, physical pain, etc., and on the other hand important events such as illnesses, deaths, fires, births of brothers and sisters, etc. We might therefore be inclined to assume that the principle governing the choice of memories is the same in the case of children as in that of adults. It is intelligible – though the fact deserves to be explicitly mentioned – that the memories retained from childhood should necessarily show evidence of the difference between what attracts the interest of a child and of an adult. This easily explains why, for instance, one woman reports that she remembers a number of accidents that occurred to her dolls when she was two years old but has no recollection of the serious and tragic events she might have observed at the same period.

Now, however, we are met with a fact that is diametrically opposed to our expectations and cannot fail to astonish us. We hear that there are some people whose earliest recollections of childhood are concerned with everyday and indifferent events which could not produce any emotional effect even in children, but which are recollected (*too* clearly, one is inclined to say)[1] in every detail, while approximately contemporary [306]
events, even if, on the evidence of their parents, they moved them intensely at the time, have not been retained in their memory. Thus the Henris mention a professor of philology whose earliest memory, dating back to between the ages of three and four, showed him a table laid for a meal and on it a basin of ice. At the same period there occurred the death of his grandmother which, according to his parents, was a severe blow to the child. But the professor of philology, as he now is, has no recollection of this bereavement; all that he remembers of those days is the basin of

1 [Cf. footnote 3, p. 284 above. The point appears again below on pp. 303 and 304.]

ice. Another man reports that his earliest memory is an episode upon a walk in which he broke off a branch from a tree. He thinks he can still identify the spot where this happened. There were several other people present, and one of them helped him.

The Henris describe such cases as rare. In my experience, based for the most part, it is true, on neurotics, they are quite frequent. One of the subjects of the Henris' investigation made an attempt at explaining the occurrence of these mnemic images, whose innocence makes them so mysterious, and his explanation seems to me very much to the point. He thinks that in such cases the relevant scene may perhaps have been only *incompletely* retained in the memory, and that that may be why it seems so unenlightening: the parts that have been forgotten probably contained everything that made the experience noteworthy. I am able to confirm the truth of this view, though I should prefer to speak of these elements of the experience being *omitted* rather than forgotten. I have often succeeded, by means of psychoanalytic treatment, in uncovering the missing portions of a childhood experience and in thus proving that when the impression, of which no more than a torso was retained in the memory, had been restored to completeness, it did in fact agree with the presumption that it is the most important things that are recollected. This, however, provides no explanation of the remarkable choice which memory has made among the elements of the experience. We must first enquire why it should be that precisely what is important is suppressed [*unterdrückt*] and what is indifferent retained; and we shall not find an explanation of this until we have investigated the mechanism of these processes more deeply. We shall then form a notion that two psychical forces [*Kräfte*]^{T} are concerned in bringing about memories of this sort.
[307] One of these forces takes the importance of the experience as a motive [*Motiv*]^{T} for seeking to remember it, while the other – a resistance – tries to prevent any such preference from being shown. These two opposing forces do not cancel each other out, nor does one of them (whether with or without loss to itself) overpower the other. Instead, a compromise is brought about, somewhat on the analogy of the resultant in a parallelogram of forces. And the compromise is this. What is recorded as a mnemic image is not the relevant experience itself – in this respect the resistance gets its way; what is recorded is another psychical element closely associated with the objectionable one – and in this respect the *first* principle shows its strength, the principle which endeavours to fix important impressions by establishing reproducible mnemic images. The result of the conflict is therefore that, instead of the mnemic image which

would have been justified by the original event, another is produced which has been to some degree associatively *displaced* [*verschoben*]^{T} from the former one. And since the elements of the experience which aroused objection were precisely the important ones, the substituted memory will necessarily lack those important elements and will in consequence most probably strike us as trivial. It will seem incomprehensible to us because we are inclined to look for the reason for its retention in its own content, whereas in fact that retention is due to the relation holding between its own content and a different one which has been suppressed. There is a common saying among us about shams, that they are not made of gold themselves but have lain beside something that *is* made of gold.[1] The same simile might well be applied to some of the experiences of childhood which have been retained in the memory.

Verschiebung

There are numerous possible types of case in which one psychical content is substituted for another, and these come about in a variety of psychological constellations. One of the simplest of these cases is obviously that occurring in the childhood memories with which we are here concerned – the case, that is, where the essential elements of an experience are represented [*vertreten*] in memory by the inessential elements of the same experience. It is a case of displacement on to something associated by continuity; or, looking at the process as a whole, a case of repression accompanied by the substitution of something in the neighbourhood (whether in space or time). I have elsewhere[2] had occasion to describe a very similar instance of substitution which occurred in the analysis of a patient suffering from paranoia. The woman in question hallucinated voices, which used to repeat long passages from Otto Ludwig's novel *Die Heiterethei* to her. But the passages they chose were the most trifling and irrelevant in the book. The analysis showed, however, that there were other passages in the same work which had stirred up the most distressing thoughts in the patient. The distressing affect was a motive for putting up a defence [*Abwehr*]^{T} against them, but the motives in favour of pursuing them further were not to be suppressed. The result was a compromise by which the innocent passages emerged in the patient's memory with pathological strength and clarity. The process which we here see at work – conflict, repression, substitution involving a compromise [*Kompromissbildung*]^{T} – returns in all psychoneurotic symptoms and gives us the key to understanding their formation. Thus it is not without importance if we are able to show the same process

[308]

Bildung

1 [The simile reappears in Chapter VII of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 160.]

2 'Further Remarks on the Neuropsychoses of Defence' (1896*b*). [See above, p. 189.]

operating in the mental life of normal individuals, and the fact that what it influences in normal people is precisely their choice of childhood memories seems to afford one more indication of the intimate relations which have already been insisted upon between the mental life of children and the psychical material of the neuroses.

The processes of normal and pathological defence and the displacements in which they result are clearly of great importance. But to the best of my knowledge no study whatever has hitherto been made of them by psychologists; and it remains to be ascertained in what strata of psychical activity and under what conditions they come into operation. The reason for this neglect may well be that our mental life, so far as it is the object of our *conscious* internal perception, shows nothing of these processes, apart from instances which we classify as 'faulty reasoning' [*Denkfehler*] and some mental operations which aim at producing a comic effect. The assertion that a psychical intensity[1] can be displaced from one presentation (which is then abandoned) on to another (which
[309] thenceforward plays the psychological part of the former one) is as bewildering to us as certain features of Greek mythology – as, for instance, when the gods are said to clothe someone with beauty as though it were with a veil, whereas *we* think only of a face transfigured by a change of expression.

Further investigation of these indifferent childhood memories has taught me that they can originate in other ways as well and that an unsuspected wealth of meaning lies concealed behind their apparent innocence. But on this point I shall not content myself with a mere assertion but shall give a detailed report of one particular instance which seems to me the most instructive out of a considerable number of similar ones. Its value is certainly increased by the fact that it relates to someone who is not at all or only very slightly neurotic.

The subject of this observation is a man of university education, aged thirty-eight.[2] Though his own profession lies in a very different field, he has taken an interest in psychological questions ever since I was able to relieve him of a slight phobia by means of psychoanalysis. Last year he drew my attention to his childhood memories, which had already played some part in his analysis. After studying the investigation made by V. and C. Henri, he gave me the following summarized account of his own experience.

1 [Cf. p. 60 above.]

2 [There can be no doubt that what follows is autobiographical material only thinly disguised. See Editors' Note, p. 294 above. At the date at which this paper was sent in for publication in May, 1899, Freud was, in fact, just forty-three years old.]

'I have at my disposal a fair number of early memories of childhood which I can date with great certainty. For at the age of three I left the small place where I was born and moved to a large town; and all these memories of mine relate to my birthplace and therefore date from my second and third years. They are mostly short scenes, but they are very well preserved and furnished with every detail of sense perception, in complete contrast to my memories of adult years, which are entirely lacking in the visual element. From my third year onwards my recollections grow scantier and less clear; there are gaps in them which must cover more than a year; and it is not, I believe, until my sixth or seventh year that the stream of my memories becomes continuous. My memories up to the time of my leaving my first place of residence fall into three groups. [310]
The first group consists of scenes which my parents have repeatedly since [*nachträglich*] described to me. As regards these, I feel uncertain whether I have had the mnemic image from the beginning or whether I only construed it after hearing one of these descriptions. I may remark, however, that there are also events of which I have no mnemic image in spite of their having been frequently retailed by my parents. I attach more importance to the second group. It comprises scenes which have not (so far as I know) been described to me and some of which, indeed, *could* not have been described to me, as I have not met the other participants in them (my nurse and playmates) since their occurrence. I shall come to the third group presently. As regards the content of these scenes and their consequent claim to being recollected, I should like to say that I am not entirely at sea. I cannot maintain, indeed, that what I have retained are memories of the most important events of the period, or what I should today judge to be the most important. I have no knowledge of the birth of a sister, who is two and a half years younger than I am; my departure, my first sight of the railway and the long carriage drive before it – none of these has left a trace in my memory. On the other hand, I can remember two small occurrences during the railway journey; these, as you will recollect, came up in the analysis of my phobia. But what should have made most impression on me was an injury to my face which caused a considerable loss of blood and for which I had to have some stitches put in by a surgeon. I can still feel the scar resulting from this accident, but I know of no recollection which points to it, either directly or indirectly.[1] It is true that I may perhaps have been under two years old at the time.

1 [This accident is referred to twice in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 15 and footnote, and **5**, 501; also, indirectly, in a letter to Fliess of October 15, 1897 (Freud, 1950*a*, Letter 71) and in Lecture XIII of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 175.]

'It follows from this that I feel no surprise at the pictures and scenes of these first two groups. No doubt they are displaced memories from which the essential element has for the most part been omitted. But in a few of them it is at least hinted at, and in others it is easy for me to complete them by following certain pointers. By doing so I can establish a
[311] sound connection between the separate fragments of memories and arrive at a clear understanding of what the childish interest was that recommended these particular occurrences to my memory. This does not apply, however, to the content of the third group, which I have not so far discussed. There I am met with material – one rather long scene and several smaller pictures – with which I can make no headway at all. The scene appears to me fairly indifferent and I cannot understand why it should have become fixed in my memory. Let me describe it to you. I see a rectangular, rather steeply sloping piece of meadowland, green and thickly grown; in the green there are a great number of yellow flowers – evidently common dandelions. At the top end of the meadow there is a cottage and in front of the cottage door two women are standing chatting busily, a peasant woman with a handkerchief on her head and a children's nurse. Three children are playing in the grass. One of them is myself (between the age of two and three); the two others are my boy cousin, who is a year older than me, and his sister, who is almost exactly the same age as I am. We are picking the yellow flowers and each of us is holding a bunch of flowers we have already picked. The little girl has the best bunch; and, as though by mutual agreement, we – the two boys – fall on her and snatch away her flowers. She runs up the meadow in tears and as a consolation the peasant woman gives her a big piece of black bread. Hardly have we seen this than we throw the flowers away, hurry to the cottage and ask to be given some bread too. And we are in fact given some; the peasant woman cuts the loaf with a long knife. In my memory the bread tastes quite delicious – and at that point the scene breaks off.

'Now what is there in this occurrence to justify the expenditure of memory which it has occasioned me? I have racked my brains in vain over it. Does the emphasis lie on our disagreeable behaviour to the little girl? Did the yellow colour of the dandelions – a flower which I am, of course, far from admiring today – so greatly please me? Or, as a result of my careering round the grass, did the bread taste so much nicer than usual that it made an unforgettable impression on me? Nor can I find any connection between this scene and the interest which (as I was able to discover without any difficulty) bound together the other scenes from
[312] my childhood. Altogether, there seems to me something not quite right

about this scene. The yellow of the flowers is a disproportionately prominent element in the situation as a whole, and the nice taste of the bread seems to me exaggerated in an almost hallucinatory fashion. I cannot help being reminded of some pictures that I once saw in a burlesque exhibition. Certain portions of these pictures, and of course the most inappropriate ones, instead of being painted, were built up in three dimensions – for instance, the ladies' bustles. Well, can you point out any way of finding an explanation or interpretation of this redundant memory of my childhood?'

I thought it advisable to ask him since when he had been occupied with this recollection: whether he was of the opinion that it had recurred to his memory periodically since his childhood, or whether it had perhaps emerged at some later time on some occasion that could be recalled. This question was all that it was necessary for me to contribute to the solution to the problem; the rest was found by my collaborator himself, who was no novice at jobs of this kind.

'I have not yet considered that point,' he replied. 'Now that you have raised the question, it seems to me almost a certainty that this childhood memory never occurred to me at all in my earlier years. But I can also recall the occasion which led to my recovering this and many other recollections of my earliest childhood. When I was seventeen and at my secondary school, I returned for the first time to my birthplace for the holidays, to stay with a family who had been our friends ever since that remote date. I know quite well what a wealth of impressions [*Erregungen*] overwhelmed me at that time. But I see now that I shall have to tell you a whole big piece of my history: it belongs here, and you have brought it upon yourself by your question. So listen. I was the child of people who were originally well-to-do and who, I fancy, lived comfortably enough in that little corner of the provinces. When I was about three, the branch of industry in which my father was concerned met with a catastrophe. He lost all his means and we were forced to leave the place and move to a large town. Long and difficult years followed, of which, as it seems to me, nothing was worth remembering. I never felt really comfortable in the town. I believe now that I was never free from a longing for the beautiful woods near our home, in which (as one of my memories from those days tells me) I used to run off from my father, [313] almost before I had learnt to walk. Those holidays, when I was seventeen, were my first holidays in the country, and, as I have said, I stayed with a family with whom we were friends and who had risen greatly in the world since our move. I could compare the comfort reigning there

with our own style of living at home in the town. But it is no use evading the subject any longer: I must admit that there was something else that excited [*erregte*] me powerfully. I was seventeen, and in the family where I was staying there was a daughter of fifteen, with whom I immediately fell in love. It was my first calf-love and sufficiently intense, but I kept it completely secret. After a few days the girl went off to her school (from which she too was home for the holidays) and it was this separation after such a short acquaintance that brought my longings to a really high pitch. I passed many hours in solitary walks through the lovely woods that I had found once more and spent my time building [*dem Aufbau*] castles in the air. These, strangely enough, were not concerned with the future but sought to improve the past. If only the smash had not occurred! If only I had stopped at home and grown up in the country and grown as strong as the young men in the house, the brothers of my love! And then if only I had followed my father's profession and if I had finally married her – for I should have known her intimately all those years! I had not the slightest doubt, of course, that in the circumstances created by my imagination [*Phantasie*][T] I should have loved her just as passionately as I really seemed to then. A strange thing. For when I see her now from time to time – she happens to have married someone here – she is quite exceptionally indifferent to me. Yet I can remember quite well for what a long time afterwards I was affected by the yellow colour of the dress she was wearing when we first met, whenever I saw the same colour anywhere else.'

That sounds very much like your parenthetical remark to the effect that you are no longer fond of the common dandelion. Do you not suspect that there may be a connection between the yellow of the girl's dress and the ultra-clear yellow of the flowers in your childhood scene?[1] [Cf. footnote 3, p. 284 above.]

[314] 'Possibly. But it was not the same yellow. The dress was more of a yellowish brown, more like the colour of wallflowers. However, I can at least let you have an intermediate idea which may serve your purpose. At a later date, while I was in the Alps, I saw how certain flowers which have light colouring in the lowlands take on darker shades at high altitudes. Unless I am greatly mistaken, there is frequently to be found in mountainous regions a flower which is very similar to the dandelion but which is dark yellow and would exactly agree in colour with the dress of the girl

1 [This was Freud's regular method of reporting conversations – his interlocutor's remarks in inverted commas and his own without any. Cf., for instance, the dialogue in *The Question of Lay Analysis* (1926*e*), *RSE*, **20**.]

I was so fond of. But I have not finished yet. I now come to a second occasion which stirred up in me the impressions of my childhood [*Kindheitseindrücke*] and which dates from a time not far distant from the first. I was seventeen when I revisited my birthplace. Three years later during my holidays I visited my uncle and met once again the children who had been my first playmates, the same two cousins, the boy a year older than I am and the girl of the same age as myself, who appear in the childhood scene with the dandelions. This family had left my birthplace at the same time as we did and had become prosperous in a far-distant city.'

And did you once more fall in love – with your cousin this time – and indulge in a new set of phantasies [*Phantasien*]?

'No, this time things turned out differently. By then I was at the university and I was a slave to my books. I had nothing left over for my cousin. So far as I know I had no similar phantasies on that occasion. But I believe that my father and my uncle had concocted a plan by which I was to exchange the abstruse subject of my studies for one of more practical value, settle down, after my studies were completed, in the place where my uncle lived, and marry my cousin. No doubt when they saw how absorbed I was in my own intentions the plan was dropped; but I fancy I must certainly have been aware of its existence. It was not until later, when I was a newly fledged man of science and hard pressed by the exigencies of life and when I had to wait so long before finding a post here, that I must sometimes have reflected that my father had meant well in planning this marriage for me, to make good the loss in which the original catastrophe had involved my whole existence.'

Then I am inclined to believe that the childhood scene we are considering emerged at this time, when you were struggling for your daily [315]
bread – provided, that is, that you can confirm my idea that it was during this same period that you first made the acquaintance of the Alps.

'Yes, that is so: mountaineering was the one enjoyment that I allowed myself at that time. But I still cannot grasp your point.'

I am coming to it at once. The element on which you put most stress in your childhood scene was the fact of the country-made bread tasting so delicious. It seems clear that this idea, which amounted almost to a hallucination, corresponded to your phantasy of the comfortable life you would have led if you had stayed at home and married this girl [in the yellow dress] – or, in symbolic language, of how sweet the bread would have tasted for which you had to struggle so hard in your later years. The yellow of the flowers, too, points to the same girl. But there are also elements in the childhood scene which can only be related to the

second phantasy – of being married to your cousin. Throwing away the flowers in exchange for bread strikes me as not a bad disguise for the scheme your father had for you: you were to give up your unpractical ideals and take on a 'bread and butter' occupation, were you not?

'It seems then that I amalgamated [*verschmolzen*][1] the two sets of phantasies of how my life could have been more comfortable – the "yellow" and the "country-made bread" from the one and the throwing away of the flowers and the actual people concerned from the other.'

Yes. You projected [*projiziert*] the two phantasies on to one another and made a childhood memory of them. The element about the alpine flowers is as it were a stamp giving the date of manufacture. I can assure you that people often construct such things unconsciously – almost like works of fiction.

'But if that is so, there was *no* childhood memory, but only a phantasy put back into childhood. A feeling tells me, though, that the scene is genuine. How does that fit it?'

There is in general no guarantee of the data produced by our memory. But I am ready to agree with you that the scene is genuine. If so, you selected it from innumerable others of a similar or another kind because, on account of its content (which in itself was indifferent) it was well adapted to represent [*zur Darstellung*] the two phantasies, which were
[316] important enough to you. A recollection of this kind, whose value lies in the fact that it represents in the memory impressions and thoughts of a later date whose content is connected with its own by symbolic or similar links, may appropriately be called a '*screen memory*'. In any case you will cease to feel any surprise that this scene should so often recur to your mind. It can no longer be regarded as an innocent one since, as we have discovered, it is calculated to illustrate the most momentous turning points in your life, the influence of the two most powerful driving forces – hunger and love.[2]

'Yes, it represented hunger well enough. But what about love?'

In the yellow of the flowers, I mean. But I cannot deny that in this childhood scene of yours love is represented far less prominently than I should have expected from my previous experience.

'No. You are mistaken. The essence of it is its representation of love. Now I understand for the first time. Think for a moment! Taking flowers away from a girl means to deflower her. What a contrast between the

1 [This process would later be described as 'condensation' ('*Verdichtung*'); cf. 1900*a*; *RSE*, **4–5**.]

2 [An allusion to a favourite line of Freud's from Schiller's 'Die Weltweisen'.]

boldness of this phantasy and my bashfulness on the first occasion and my indifference on the second.'

I can assure you that youthful bashfulness habitually has as its complement bold phantasies of that sort.

'But in that case the phantasy that has transformed itself into these childhood memories would not be a conscious one that I can remember, but an unconscious one?'

Unconscious thoughts which are a prolongation of conscious ones. You think to yourself 'If I had married so-and-so', and behind the thought there is an impulse [*Antrieb*] to form a picture of what the 'being married' really is.

'I can go on with it now myself. The most seductive part of the whole subject for a young scapegrace is the picture of the marriage night. (What does he care about what comes afterwards?) But that picture cannot venture out into the light of day: the dominating mood of diffidence and of respect towards the girl keeps it suppressed. So it remains unconscious –'

And slips away into a childhood memory. You are quite right. It is precisely the coarsely sensual element in the phantasy which explains why it does not develop into a *conscious* phantasy but must be content to find its way allusively and under a flowery disguise into a childhood scene. [317]

'But why, precisely, into a *childhood* scene, I should like to know?'

For the sake of its innocence, perhaps. Can you imagine a greater contrast to these designs for gross sexual aggression than childish pranks? However, there are more general grounds that have a decisive influence in bringing about the slipping away of repressed thoughts and wishes into childhood memories: for you will find the same thing invariably happening in hysterical patients. It seems, moreover, as though the recollection of the remote past is in itself facilitated by some pleasurable motive [*Lustmotiv*][T]: *forsan et haec olim meminisse juvabit*.[1] *Lust*

'If that is so, I have lost all faith in the genuineness of the dandelion scene. This is how I look at it: On the two occasions in question, and with the support of very comprehensible realistic motives, the thought occurred to me: "If you had married this or that girl, your life would have become much pleasanter." The sensual current in my mind took hold of the thought which is contained in the protasis[2] and repeated it in images of a kind capable of giving that same sensual current satisfaction. This second version of the thought remained unconscious on account of

1 ['Some day, perhaps, it will be a joy to remember even these things.' Virgil, *Aeneid*, I, 203.]

2 [A protasis is a conditional clause and an apodosis (see below) is a consequential one.]

its incompatibility [*Unverträglichkeit*] with the dominant sexual disposition; but this very fact of its remaining unconscious enabled it to persist in my mind long after changes in the real situation had quite got rid of the conscious version. In accordance, as you say, with a general law, the clause that had remained unconscious sought to transform itself into a childhood scene which, on account of its innocence, would be able to become conscious. With this end in view it had to undergo a fresh transformation, or rather two fresh transformations. One of these removed the objectionable element from the protasis by expressing it figuratively; the second forced the apodosis into a shape capable of visual representa-
[318] tion – using for the purpose the intermediary ideas of "bread" and "bread and butter occupations". I see that by producing a phantasy like this I was providing, as it were, a fulfilment of the two suppressed wishes – for deflowering a girl and for material comfort. But now that I have given such a complete account of the motives that led to my producing the dandelion phantasy, I cannot help concluding that what I am dealing with is something that never happened at all but has been unjustifiably smuggled in among my childhood memories.'

I see that I must take up the defence of its genuineness. You are going too far. You have accepted my assertion that every suppressed phantasy of this kind tends to slip away into a childhood scene. But suppose now that this cannot occur unless there is a memory trace the content of which offers the phantasy a point of contact – comes, as it were, halfway to meet it. Once a point of contact of this kind has been found – in the present instance it was the deflowering, the taking away of the flowers – the remaining content of the phantasy is remodelled with the help of every legitimate intermediate idea – take the bread as an example – till it can find further points of contact with the content of the childhood scene. It is very possible that in the course of this process the childhood scene itself also undergoes changes; I regard it as certain that falsifications of memory may be brought about in this way too. In your case the childhood scene seems only to have had some of its lines engraved more deeply: think of the overemphasis on the yellow and the exaggerated niceness of the bread. But the raw material was utilizable. If that had not been so, it would not have been possible for this particular memory, rather than any others, to make its way forward into consciousness. No such scene would have occurred to you as a childhood memory, or perhaps some other one would have – for you know how easily our ingenuity can build connecting bridges from any one point to any other. And apart from your own subjective feeling which I am not inclined to

underestimate, there is another thing that speaks in favour of the genuineness of your dandelion memory. It contains elements which have not been solved by what you have told me and which do not in fact fit in with the sense required by the phantasy. For instance, your boy cousin helping you to rob the little girl of her flowers – can you make any sense of the idea of being helped in deflowering someone? or of the peasant woman [319]
and the nurse in front of the cottage?

'Not that I can see.'

So the phantasy does not coincide completely with the childhood scene. It is only based on it at certain points. That argues in favour of the childhood memory being genuine.

'Do you think an interpretation [*Deutung*][T] like this of an apparently innocent childhood memory is often applicable?'

Very often, in my experience. Shall we amuse ourselves by seeing whether the two examples given by the Henris can be interpreted as screen memories concealing subsequent experiences and wishes? I mean the memory of a table laid for a meal with a basin of ice on it, which was supposed to have some connection with the death of the subject's grandmother, and the other memory, of a child breaking off a branch from a tree while he was on a walk and of his being helped to do it by someone.

He reflected for a little and then answered: 'I can make nothing of the first one. It is most probably a case of displacement at work; but the intermediate steps are beyond guessing. As for the second case, I should be prepared to give an interpretation, if only the person concerned had not been a Frenchman.'

I cannot follow you there. What difference would that make?

'A great deal of difference, since what provides the intermediate step between a screen memory and what it conceals is likely to be a verbal expression. In German "to pull one out" is a very common vulgar term for masturbation.[1] The scene would then be putting back into early childhood a seduction to masturbation – someone was helping him to do it – which in fact occurred at a later period. But even so, it does not fit, for in the childhood scene there were a number of other people present.'

Whereas his seduction to masturbate must have occurred in solitude and secrecy. It is just that contrast that inclines me to accept your view: it serves once again to make the scene innocent. Do you know what it means when in a dream we see 'a lot of strangers', as happens so often in dreams of nakedness in which we feel so terribly embarrassed?

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 311 *n*. 8.]

[320] Nothing more nor less than secrecy, which there again is expressed by its opposite.[1] However, our interpretation remains a jest, since we have no idea whether a Frenchman would recognize an allusion to masturbation in the words *casser une branche d'un arbre* or in some suitably emended phrase.

This analysis, which I have reproduced as accurately as possible, will, I hope, have to some extent clarified the concept of a 'screen memory' as one which owes its value as a memory not to its own content but to the relation existing between that content and some other, that has been suppressed. Different classes of screen memories can be distinguished according to the nature of that relation. We have found examples of two of these classes among what are described as the earliest memories of childhood – that is, if we include under the heading of screen memories the incomplete childhood scenes which are innocent by very reason of their incompleteness. It is to be anticipated that screen memories will also be formed from residues of memories relating to later life as well. Anyone who bears in mind their distinctive feature – namely that they are extremely well remembered but that their content is completely indifferent – will easily recall a number of examples of the sort from his own memory. Some of these screen memories dealing with events later in life owe their importance to a connection with experiences in early youth which have remained suppressed. The connection, that is, is the reverse of the one in the case which I have analysed, where a childhood memory was accounted for by later experiences. A screen memory may be described as 'retrogressive' or as having 'pushed forward' according as the one chronological relation or the other holds between the screen and the thing screened off.[2] From another point of view, we can distinguish positive screen memories from negative ones (or refractory memories) whose content stands in a contrary relation to the suppressed material. The whole subject deserves a more thorough examination; but I must content myself with pointing out what complicated processes – processes, incidentally, which are altogether analogous to the [321] formation of hysterical symptoms – are involved in the building up [*Herstellung*] of our store of memories.

Our earliest childhood memories will always be a subject of special interest because the problem mentioned at the beginning of this paper (of how it comes about that the impressions which are of most

1 [Cf. *RSE*, **4**, 218.]

2 [I.e. according to whether the displacement has been in a backward or forward direction.]

significance for our whole future usually leave no mnemic images behind) leads us to reflect upon the origin of conscious memories in general. We shall no doubt be inclined at first to separate off the screen memories which are the subject of this study as heterogeneous elements among the residues of childhood recollections. As regards the remaining images, we shall probably adopt the simple view that they arise simultaneously with an experience as an immediate consequence of the impression it makes and that thereafter they recur from time to time in accordance with the familiar laws of reproduction. Closer observation, however, reveals certain features which do not tally with this view. Above all, there is the following point. In the majority of significant and in other respects unimpeachable childhood scenes the subject sees himself in the recollection as a child, with the knowledge that this child is himself; he sees this child, however, as an observer from outside the scene would see him. The Henris duly draw attention to the fact that many of those taking part in their investigation expressly emphasized this peculiarity of childhood scenes. Now it is evident that such a picture cannot be an exact repetition of the impression that was originally received. For the subject was then in the middle of the situation and was attending not to himself but to the external world.

Whenever in a memory the subject himself appears in this way as an object among other objects this contrast between the acting and the recollecting ego [*Ichs*][T] may be taken as evidence that the original impression has been worked over. It looks as though a memory trace from childhood had here been translated back into a plastic and visual form at a later date – the date of the memory's arousal. But no reproduction of the original impression has ever entered the subject's consciousness.

There is another fact that affords even more convincing evidence in favour of this second view. Out of a number of childhood memories of significant experiences, all of them of similar distinctness and clarity, there will be some scenes which, when they are tested (for instance by the [322]
recollections of adults), turn out to have been falsified. Not that they are complete inventions; they are false in the sense that they have shifted an event to a place where it did not occur – this is the case in one of the instances quoted by the Henris – or that they have merged [*verschmelzen*] two people into one or substituted one for the other, or the scenes as a whole give signs of being combinations [*Zusammensetzung*] of two separate experiences. Simple inaccuracy of recollection does not play any considerable part here, in view of the high degree of sensory intensity possessed by the images and the efficiency of the function of

memory in the young; close investigation shows rather that these falsifications of memory are tendentious – that is, that they serve the purposes of the repression and replacement of objectionable or disagreeable impressions. It follows, therefore, that these falsified memories too must have originated at a period of life when it has become possible for conflicts of this kind and impulsions [*Antriebe*] towards repression to have made a place for themselves in mental life [*Seelenleben*][T] – far later, therefore, than the period to which their content belongs. But in these cases too the falsified memory is the first that we become aware of: the raw material of memory traces out of which it was forged remains unknown to us in its original form.

Seele

The recognition of this fact must diminish the distinction we have drawn between screen memories and other memories derived from our childhood. It may indeed be questioned whether we have any memories at all *from* our childhood: memories *relating to* our childhood may be all that we possess. Our childhood memories show us our earliest years not as they were but as they appeared at the later periods when the memories were aroused. In these periods of arousal, the childhood memories did not, as people are accustomed to say, *emerge*; they were *formed* [*gebildet*] at that time. And a number of motives, with no concern for historical accuracy, had a part in forming [*Bildung*] them, as well as in the selection of the memories themselves.[1]

1 [The type of screen memory considered here is related to the 'retrospective phantasies' often discussed by Freud later; e.g. in the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 158 f. *n*., in Sections V and VII of the 'Wolf Man' analysis (1918*b*), ibid., **17**, 52 f. and 92 *n*., and in Lectures XXI and XXIII of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 296 and 323–8.]

AUTOBIOGRAPHICAL NOTE

(1901 [1899])

EDITORS' NOTE

AUTOBIOGRAPHICAL NOTE

GERMAN EDITIONS

1901 In J. L. Pagel's *Biographisches Lexikon hervorragender Ärzte des neunzehnten Jahrhunderts* [Biographical Lexicon of Eminent Doctors of the Nineteenth Century]. Berlin and Vienna, Column 545. [324]

1987 *GW*, **Nachtr.**, 371.

ENGLISH TRANSLATION

1962 *SE*, **3**, 325. (Tr. J. Strachey.)

This translation is a slightly revised and corrected reprint of the *SE* version.

Internal evidence shows that this must have been written in the autumn of 1899. It is of interest as showing the view which Freud expected to have taken of his activities on the eve of the publication of the work which was to revolutionize his position in the scientific world. The numerous abbreviations in the original have been expanded.

AUTOBIOGRAPHICAL NOTE

FREUD, SIGM., Vienna. Born May 6, 1856, at Freiberg in Moravia. [325]
Studied in Vienna. Pupil of Brücke, the physiologist. Promotion [M.D. degree], 1881. Pupil of Charcot in Paris, 1885–6. Habilitation [appointment as Privatdozent], 1885. Has worked as physician and Dozent at Vienna University since 1886. Proposed as Professor Extraordinarius, 1897.[1] Earlier, Freud produced writings on histology and cerebral anatomy, and, subsequently, clinical works on neuropathology; translated writings by Charcot and Bernheim. In 1884 'Über Coca' [On Coca], a paper which introduced cocaine into medicine. In 1891 *Zur Auffassung der Aphasien* [Conceptualizing the Aphasias]. In 1891 and 1893 monographs on the cerebral palsies of children, which culminated in 1897 in the volume on the subject in Nothnagel's *Handbuch*. In 1895 *Studien über Hysterie* [Studies on Hysteria] (with Dr J. Breuer). Since then Freud has turned to the study of the psychoneuroses and especially hysteria, and in a series of shorter works he has stressed the aetiological significance of sexual life for the neuroses. He has also developed a new psychotherapy of hysteria, on which only extremely little has been published. A book, *Die Traumdeutung* [The Interpretation of Dreams], is in the press.

1 [See Editors' Note to Freud's list of abstracts of his early writings (1897*b*), p. 229 f. above.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

Title page of the first edition of *The Interpretation of Dreams*

Title page of the first edition of The Interpretation of Dreams

Notwithstanding the date '1900' at the bottom of the page, it was actually published on November 4, 1899. In a letter to Wilhelm Fliess dated March 23, 1900, Freud wrote: 'It has been a consolation to me in many a gloomy hour to know I have this book to leave behind me.'

I THE SCIENTIFIC LITERATURE DEALING WITH THE PROBLEMS OF DREAMS 1

(A) The Relation of Dreams to Waking Life 6

(B) The Material of Dreams – Memory in Dreams 10

(C) The Stimuli and Sources of Dreams 20

(1) External Sensory Stimuli 21

(2) Internal (Subjective) Sensory Excitations 27

(3) Internal Organic Somatic Stimuli 30

(4) Psychical Sources of Stimulation 36

(D) Why Dreams are Forgotten after Waking 39

(E) The Distinguishing Psychological Characteristics of Dreams 43
(F) The Moral Sense in Dreams 58
(G) Theories of Dreaming and its Function 66
(H) The Relations between Dreams and Mental Diseases 78
Postscript, 1909 83
Postscript, 1914 85

II THE METHOD OF INTERPRETING DREAMS: AN ANALYSIS OF A SPECIMEN DREAM 86

III A DREAM IS THE FULFILMENT OF A WISH 109

IV DISTORTION IN DREAMS 119

V THE MATERIAL AND SOURCES OF DREAMS 144
(A) Recent and Indifferent Material in Dreams 146
(B) Infantile Material as a Source of Dreams 167
(C) The Somatic Sources of Dreams 195
(D) Typical Dreams 214
(α) Embarrassing Dreams of Being Naked 215
(β) Dreams of the Death of Persons of whom the Dreamer is Fond 220
(γ) Other Typical Dreams 241
(δ) Examination Dreams 243

VI THE DREAM-WORK 246
(A) The Work of Condensation 248
(B) The Work of Displacement 272
(C) The Means of Representation in Dreams 276

VOLUME 5

(D) Considerations of Representability 303

(E) Representation by Symbols in Dreams – Some Further Typical Dreams 313

(F) Some Examples – Calculations and Speeches in Dreams 362

(G) Absurd Dreams – Intellectual Activity in Dreams 380

(H) Affects in Dreams 411

(I) Secondary Revision 437

VII THE PSYCHOLOGY OF THE DREAM PROCESSES 455

(A) The Forgetting of Dreams 458

(B) Regression 476

(C) Wish Fulfilment 492

(D) Arousal by Dreams – The Function of Dreams – Anxiety Dreams 513

(E) The Primary and Secondary Processes – Repression 526

(F) The Unconscious and Consciousness – Reality 545

Appendix A: Running Heads from the First Edition 556

Appendix B: A Premonitory Dream Fulfilled 562

Appendix C: Characteristics of My Own Dreams (Typical Dreams) 565

Appendix D: List of Writings by Freud dealing predominantly or largely with Dreams 568

On Dreams (1901)

Editors' Note 571

On Dreams 573

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

The Interpretation of Dreams[t]

(1900)

Flectere si nequeo superos, Acheronta movebo[1]

1 [In a letter to Werner Achelis of January 30, 1927, Freud wrote: 'Finally a word about the translation of the motto on *The Interpretation of Dreams*, also about the interpretation of the motto. You translate "Acheronta movebo" as "moving the citadels of the earth". But it means to "stir up the underworld". I had borrowed the quotation from Lassalle in whose case it was probably meant personally and relating to social – not psychological – classifications. In my case it was meant merely to emphasize the most important part in the dynamic of the dream. The wish rejected by the higher mental agencies (the repressed dream wish) stirs up the mental underworld (the unconscious) in order to get a hearing. What can you find "Promethean" about this?' (Freud, 1960*a*.) (See also p. 544 below.)]

Interpreting Dreams
2006 By J. A. Underwood. In *Penguin Modern Classics*. London: Penguin Books.

The present translation is a revised and corrected reprint of the one by James Strachey published in 1953.

1. *Bibliographical*

Actually *Die Traumdeutung* made its first appearance in 1899. The fact is mentioned by Freud at the beginning of his second paper on Josef Popper (1932*c*), *RSE*, **22**, 231: 'It was in the winter of 1899 that my book on *The Interpretation of Dreams* (though its title page was post-dated into the new century) at length lay before me.' But we have more precise information from his correspondence with Wilhelm Fliess (Freud, 1950*a*).[1] In his letter of November 5, 1899 (Letter 123), Freud announces that 'yesterday at length the book appeared'; and from the preceding letter it seems that Freud himself had received two advance copies about a fortnight earlier, one of which he had sent to Fliess as a birthday present.

The Interpretation of Dreams was one of the two books – the *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, was the other – which Freud kept more or less systematically 'up to date' as they passed through their series of editions. After the third edition of the present work, the changes in it were not indicated in any way; and this produced a somewhat confusing effect on the reader of the later editions, since the new material sometimes implied a knowledge of modifications in Freud's views dating from times long subsequent to the period at which the book was originally written. In an attempt to get over this difficulty, the editors of the first collected edition of Freud's works (the *Gesammelte Schriften*) reprinted the first edition of *The Interpretation of Dreams* in its original form in one volume, and put into a second volume all the material that had been added subsequently. Unfortunately, however, the work was not carried out very systematically, for the additions themselves were not dated and thereby much of the advantage of the plan was sacrificed. In subsequent editions (prior to the 1972 *Studienausgabe* edition), a return was made to the old, undifferentiated single volume.

By far the greater number of additions dealing with any single subject are those concerned with symbolism in dreams. Freud explains in his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, as well as at the beginning of Chapter VI, Section E (p. 313 below), of the present work, that he arrived late at a full realization [xiii] of the importance of this side of the subject. In the first edition, the discussion of symbolism was limited to a few pages and a single specimen dream (giving instances of sexual symbolism) at the end of the section on 'Considerations of Representability' in Chapter VI. In the second edition (1909), nothing was added to this section; but, on the other hand, several pages on sexual symbolism were inserted at the end of the section on 'Typical Dreams' in Chapter V. These were very considerably expanded in the third edition (1911), while the original passage in Chapter VI still

1 References to the Fliess letters in the *RSE* are to the 1954 English translation by Mosbacher & Strachey. The (unabridged) correspondence is also available in an alternative translation by Masson (Freud, 1985*c*). See the Preface to the Revised Edition, *RSE*, **1**, xxx.

remained unaltered. A reorganization was evidently overdue, and in the fourth edition (1914) an entirely new section on 'Symbolism' was introduced into Chapter VI, and into this the material on the subject that had accumulated in Chapter V was now transplanted, together with a quantity of entirely fresh material. No changes in the structure of the book were made in later editions, though much further matter was added. After the two-volume version (1925) – that is, in the eighth edition (1930) – some passages in the section on 'Typical Dreams' in Chapter V, which had been altogether dropped at an earlier stage, were reinserted.

In the fourth, fifth, sixth and seventh editions (that is, from 1914 to 1922), two essays by Otto Rank (on 'Dreams and Creative Writing' and 'Dreams and Myths') were printed at the end of Chapter VI, but were subsequently omitted.

There remain the bibliographies. The first edition contained a list of some eighty books, to the great majority of which Freud refers in the text. This was left unchanged in the second and third editions, but in the third a second list was added, of some forty books written since 1900. Thereafter, both lists began to increase rapidly, till in the eighth edition the first list contained some 260 works and the second over 200. At this stage only a minority of the titles in the first (pre-1900) list were of books actually mentioned in Freud's text; while, on the other hand, the second (post-1900) list (as may be gathered from Freud's own remarks in his various prefaces) could not really keep pace with the production of analytic or quasi-analytic writings on the subject. Furthermore, quite a number of works quoted by Freud in the text were not to be found in *either* list. It seems probable that, from the third edition onwards, Otto Rank became chiefly responsible for these bibliographies. A letter from Freud to André Breton, dated December 14, 1932 (1933*e*), states explicitly that in the fourth edition and afterwards the bibliographies were entirely in the hands of Rank.

For an illuminating discussion of Freud's fluctuating attitude to his magnum opus over the decades, whenever a new edition had to be prepared, see Grubrich-Simitis (1999). Equally valuable if not more so is her description and analysis of Freud's unpublished notes on dreams, which he made throughout his life, some of which found their way into successive editions of *The Interpretation of Dreams*, some not (Grubrich-Simitis, 1993, 140–8; trans., 104–11). The unpublished Freud material examined by Grubrich-Simitis also includes a lengthy characterization by Freud of his own typical dreams, a translation of which appears below as Appendix C (p. 565 ff.), together with a translation of the running heads from the first German edition (Appendix A, p. 556 ff.).

2. *Historical*

Freud's correspondence with Fliess enables us to follow the composition of *The Interpretation of Dreams* in some detail. In his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 18, Freud wrote, looking back upon his leisurely rate of publication in earlier days: '*The Interpretation of Dreams*, for instance, was finished in all essentials at the beginning of 1896 but was not written out until the summer of 1899.' Again, in the introductory remarks to his paper on the psychological consequences of the anatomical distinction between the sexes (1925*j*), ibid., **19**, 249–50, he wrote: 'My *Interpretation of Dreams* (1900*a*) and my "Fragment of an Analysis of a Case of Hysteria" (1905*e*) . . . were suppressed by me – if not for the nine years [xiv]

enjoined by Horace – at all events for four or five years before I allowed them to be published.' We are now in a position to amplify and in certain respects to correct these later recollections, on the basis of the author's contemporary evidence.

Apart from a number of scattered references to the subject – which, in his correspondence, go back at least as early as 1882 – the first important published evidence of Freud's interest in dreams occurs in the course of a long footnote to the first of his case histories (that of Frau Emmy von N., under the date of May 15) in Breuer & Freud's *Studies on Hysteria* (1895*d*), *RSE*, **2**, 60–3 *n*. He is discussing the fact that neurotic patients seem to be under a necessity to bring into association with one another any ideas that happen to be simultaneously present in their minds. He goes on: 'Not long ago I was able to convince myself of the strength of a compulsion of this kind towards association from some observations made in a different field. For several weeks I found myself obliged to exchange my usual bed for a harder one, in which I had more numerous or more vivid dreams, or in which, it may be, I was unable to reach the normal depth of sleep. In the first quarter of an hour after waking I remembered all the dreams I had had during the night, and I took the trouble to write them down and try to solve them. I succeeded in tracing all these dreams back to two factors: (1) to the necessity for working out any ideas which I had only dwelt [xv] upon cursorily during the day – which had only been touched upon and not finally dealt with; and (2) to the compulsion to link together any ideas that might be present in the same state of consciousness. The senseless and contradictory character of the dreams could be traced back to the uncontrolled ascendancy of this latter factor.'

This passage unfortunately cannot be exactly dated. The Preface to the volume was written in April, 1895. A letter of June 22, 1894 (Letter 19) seems to imply that the case histories were already finished then, and this was quite certainly so by March 4, 1895. Freud's letter of that date (Letter 22) is of particular interest, as giving the first hint of the theory of wish fulfilment: in the course of it he quotes the story of the medical student's 'dream of convenience' which is included on p. 111 f. of the present volume. It was not, however, until July 24, 1895, that the analysis of his own dream of 'Irma's injection' – the specimen dream of Chapter II – established that theory definitely in Freud's mind. (See Letter 137 of June 12, 1900.) In September of this same year (1895) Freud wrote the first part of his 'Project for a Scientific Psychology' (published as an Appendix to the Fliess correspondence and reprinted in *RSE*, **1**, 205 ff.). Sections 19, 20 and 21 of this 'Project' constitute a first approach to a coherent theory of dreams. It already includes many important elements which reappear in the present work, such as (1) the wish-fulfilling character of dreams, (2) their hallucinatory character, (3) the regressive functioning of the mind in hallucinations and dreams (this had already been indicated by Breuer in his theoretical contribution to *Studies on Hysteria*), (4) the fact that the state of sleep involves motor paralysis, (5) the nature of the mechanism of displacement in dreams and (6) the similarity between the mechanisms of dreams and of neurotic symptoms. More than all this, however, the 'Project' gives a clear indication of what is probably the most momentous of the discoveries given to the world in *The Interpretation of Dreams* – the distinction between the two different modes of mental functioning, the primary and secondary processes.

This, however, is far from exhausting the importance of the 'Project' and of the letters to Fliess written in connection with it towards the end of 1895. It is no exaggeration to say that much of the seventh chapter of *The Interpretation of Dreams*, and, indeed, of Freud's later 'metapsychological' studies, only became fully intelligible after the publication of the 'Project'.

[xvi] Students of Freud's theoretical writings have been aware that even in his profoundest psychological speculations little or no discussion is to be found upon some of the most fundamental of the concepts of which he makes use: such concepts, for instance, as 'mental energy', 'sums of excitation', 'cathexis', 'quantity', 'quality', 'intensity', and so on. Almost the only explicit approach to a discussion of these concepts among Freud's published works is the penultimate sentence of his first paper on the 'Neuropsychoses of Defence' (1894*a*), *RSE*, **3**, 56, in which he lays down a hypothesis that 'in mental functions something is to be distinguished – a quota of affect or sum of excitation – which possesses all the characteristics of a quantity (though we have no means of measuring it), which is capable of increase, diminution, displacement and discharge, and which is spread over the memory traces of ideas somewhat as an electric charge is spread over the surface of a body'. The paucity of explanation of such basic notions in Freud's later writings suggests that he was taking it for granted that they were as much a matter of course to his readers as they were to himself; and we owe it as a debt of gratitude to the posthumously published correspondence with Fliess that it throws so much light precisely upon these obscurities.

It is, of course, impossible to enter here into any detailed discussion of the subject, and the reader must be referred to the volume itself (Freud, 1950*a*) and to Dr Kris's illuminating introduction to it.[1] The editorial matter in the first volume of the *RSE* is also essential reading. The crux of the position can, however, be indicated quite simply. The essence of Freud's 'Project' lay in the notion of combining into a single whole two theories of different origin. The first of these was derived ultimately from the physiological school of Helmholtz, of which Freud's teacher, the physiologist Brücke, was a principal member. According to this theory, neurophysiology, and consequently psychology, was governed by purely chemicophysical laws. Such, for instance, was the 'principle of constancy', frequently mentioned both by Freud and Breuer and expressed in these terms in 1892 (in a posthumously published draft, Breuer & Freud, 1940*d*): 'The nervous system endeavours to keep constant something in its functional relations that we may describe as the "sum of excitation".' The greater part of the theoretical contribution made by Breuer (another disciple of the [xvii] Helmholtz school) to the *Studies on Hysteria* was an elaborate construction along these lines. The second main theory called into play by Freud in his 'Project' was the anatomical doctrine of the neuron, which was becoming accepted by neuroanatomists at the end of the 1880s. (The term 'neuron' was only introduced, by Waldeyer, in 1891.) This doctrine laid it down that the functional unit of the central nervous system was a distinct cell, having no direct anatomical continuity with adjacent cells. The opening sentences of the 'Project' show clearly how its basis lay in a combination of these two theories. Its aim, wrote Freud, was 'to represent psychical processes as quantitatively determinate states of specifiable material particles'. He went on to postulate that these 'material particles' were the neurons and that what distinguished

1 Bernfeld's paper on 'Freud's Earliest Theories' (1944) is also of great interest in this connection.

their being in a state of activity from their being in a state of rest was a 'quantity' which was 'subject to the general laws of motion'. Thus, a neuron might either be 'empty' or 'filled with a certain quantity', that is 'cathected'.[1] 'Nervous excitation' was to be interpreted as a 'quantity' flowing through a system of neurons, and such a current might either be resisted or facilitated according to the state of the 'contact barriers' between the neurons. (It was only later, in 1897, that the term 'synapse' was introduced by Foster & Sherrington.) The functioning of the whole nervous system was subject to a general principle of 'inertia', according to which neurons always tend to get rid of any 'quantity' with which they may be filled – a principle correlative with the principle of 'constancy'. Using these and similar concepts as his bricks, Freud constructed a highly complicated and extraordinarily ingenious working model of the mind as a piece of neurological machinery.

A principal part was played in Freud's scheme by a hypothetical division of the neurons into three classes or systems, differentiated according to their modes of functioning. Of these the first two were concerned respectively with *external* stimuli and *internal* excitations. Both of these operated on a purely *quantitative* basis; that [xviii] is to say, their actions were wholly determined by the magnitude of the nervous excitations impinging on them. The third system was correlated with the *qualitative* differences which distinguish conscious sensations and feelings. This division of the neurons into three systems was the basis of elaborate physiological explanations of such things as the working of memory, the perception of reality, the process of thought, and also the phenomena of dreaming and of neurotic disorder.

But obscurities and difficulties began to accumulate and, during the months after writing the 'Project', Freud was continually emending his theories. As time passed, his interest was gradually diverted from neurological and theoretical on to psychological and clinical problems, and he eventually abandoned the entire scheme. And when some years later, in the seventh chapter of the present book, he took the theoretical problem up once more – though he certainly never gave up his belief that ultimately a physical groundwork for psychology would be established – the neurophysiological basis was ostensibly dropped. Nevertheless – and this is why the 'Project' is of importance to readers of *The Interpretation of Dreams* – much of the general pattern of the earlier scheme, and many of its elements, were carried over into the new one. The systems of neurons were replaced with *psychical* systems or agencies; a hypothetical 'cathexis' of psychical energy took the place of the physical 'quantity'; the principle of inertia became the basis of the pleasure (or, as Freud here called it, the unpleasure) principle. Moreover, some of the detailed accounts of psychical processes given in the seventh chapter owe much to their physiological forerunners and can be more easily understood by reference to them. This applies, for instance, to the description of the laying down of memory traces in the 'mnemic systems', to the discussion of the nature of wishes and of the different ways of satisfying them, and to the stress laid upon the part played by verbal thought processes in the making of adjustments to the demands of reality.

1 It must be emphasized that these speculations of Freud's date from a period many years before any definitive conclusions had been reached about the nature of nervous impulses and the conditions governing their transmission.

All of this is enough largely to justify Freud's assertion that *The Interpretation of Dreams* 'was finished in all essentials at the beginning of 1896'. Nevertheless, we are now in a position to add some qualifications. Thus, the existence of the Oedipus complex was only established during the summer and autumn of 1897 (Letters 64 to [xix]
71); and though this was not in itself a direct contribution to the theory of dreams, it nevertheless played a large part in emphasizing the *infantile* roots of the unconscious wishes underlying dreams. Of more obvious theoretical importance was the discovery of the omnipresence in dreams of the wish to sleep. This was announced by Freud as late as on June 9, 1899 (Letter 108). Again, the first hint at the process of 'secondary revision' seems to be given in a letter of July 7, 1897 (Letter 66). The similarity in structure between dreams and neurotic symptoms had, as we have seen, already been remarked on in the 'Project' in 1895, and was alluded to at intervals up to the autumn of 1897. Curiously enough, however, it seems thereafter to have been forgotten; for it is announced on January 3, 1899 (Letter 101) as a new discovery and as an explanation of why the book had so long remained unfinished.

The Fliess correspondence enables us to follow the actual process of composition in some detail. The idea of writing the book is first mentioned by Freud in May, 1897, but quickly put on one side, probably because his interest began to be centred at that time on his self-analysis, which was to lead during the summer to his discovery of the Oedipus complex. At the end of the year the book was taken up once more, and in the early months of 1898 a first draft of the whole work seems to have been completed, with the exception of the first chapter.[1] Work upon it came to a standstill in June of that year and was not resumed after the summer vacation. On October 23, 1898 (Letter 99), Freud writes that the book 'remains stationary, unchanged; I have no motive for preparing it for publication, and the gap in the psychology [i.e. Chapter VII] as well as the gap left by removing the completely analysed sample dream [cf. below] are obstacles to my finishing it which I have not yet overcome'. There was a pause of many months, till suddenly, and, as Freud himself writes, 'for no particular reason', the book began to stir again towards the end of May, 1899. Thereafter, it proceeded rapidly. The first chapter, dealing with the literature, which had always been a bugbear to Freud, was finished in June and the first pages sent to the printer. [xx]
The revision of the middle chapters was completed by the end of August, and the last, psychological, chapter was entirely rewritten and the final pages despatched early in September.

Both the manuscript and the proofs were regularly submitted by Freud to Fliess for his criticism. He seems to have had considerable influence on the final shape of the book, and to have been responsible for the omission (evidently on grounds of discretion) of an analysis of one important dream of Freud's own (cf. above). But the severest criticisms came from the author himself, and these were directed principally against the style and literary form. 'I think', he wrote on September 21, 1899 (Letter 119), when the book was finished, 'my self-criticism was not entirely unjustified. Somewhere hidden within me I too have some fragmentary sense of form, some appreciation of beauty as a species of perfection; and the involved sentences of my book on dreams, bolstered up on indirect phrases and with sidelong glances at their

1 This must be what is alluded to in a passage on p. 427 of the present work, in which Freud remarks that he had 'postponed the printing of the finished manuscript for more than a year'. Actually the first chapter had still to be written.

subject matter, have gravely affronted some ideal within me. And I am scarcely wrong in regarding this lack of form as a sign of an incomplete mastery of the material.'

But in spite of these self-criticisms, and in spite of the depression which followed the almost total neglect of the book by the outside world – only 351 copies were sold in the first six years after publication – *The Interpretation of Dreams* was always regarded by Freud as his most important work: 'Insight such as this', as he wrote in his Preface to the third English edition, 'falls to one's lot but once in a lifetime.'

3. *Scientific Fate*

In light of its exceptional position, and the quasi-neurophysiological provenance of some aspects of the model, it may be appropriate to outline the scientific fate of the main hypotheses of this particular book, especially in the years following its publication in the *Standard Edition*.[1]

In the very year in which this, the inaugural volume of the *SE*, appeared (1953), Eugene Aserinsky & Nathan Kleitman made a momentous discovery which heralded a slew of findings that were almost impossible to reconcile with Freud's dream theory, and, by implication, with his conception of the mental apparatus as described in Chapter VII. This was the discovery of a periodic physiological state of arousal that has since come to be known as 'REM sleep' after the rapid eye movements that are its most obvious external manifestation (along with motor paralysis, cerebral activation and a host of other bodily changes; Aserinsky & Kleitman, 1953, 1955).

Dement & Kleitman (1957*a*&*b*) soon showed that the majority of dreams occur while the brain is in this paradoxical state of simultaneous sleep and arousal. With the further discovery that a homologous state occurs in almost all mammals, it became possible to elucidate the precise brain mechanisms that regulate it. The most decisive finding was reported by Jouvet (1967), namely that the REM state is generated not in the forebrain regions associated with higher mental functions but rather in a lowly structure known as the pons. A range of vital bodily functions are orchestrated at that level, but the significant fact for dream psychology was that the pons could not possibly be the generator of the wishful *thoughts* that Freud claimed were the instigators of dreams. Within the following ten years, Allan Hobson laid bare a simple neurochemical mechanism by means of which cholinergic pontine cells appeared to generate REM and, by implication, dreams. Coupled with the fact that REM occurred automatically in regular (roughly 90-minute) cycles, Hobson concluded that Freud's most fundamental claims were disproven:

> The primary motivating force of dreaming is not psychological but physiological since the time of occurrence and duration of dreaming sleep are quite constant suggesting a pre-programmed, neurally determined genesis. If we assume that the physiological substrate of [the mind] is in the forebrain, these facts completely eliminate any possible contribution of ideas (or their neural substrate) to the primary driving force of the dream process. (Hobson & McCarley, 1977, 1346.)

1 It was not editorial policy in the *SE* (and nor is it in the *RSE*) to provide 'updates' of Freud's theories in the light of subsequent scientific developments. Rather, our intention here is to draw attention to a major debate that has raged in the secondary literature since the publication of the *SE*.

Although it still seemed vaguely possible that Freud's theory could be retrofitted on to the new findings (for example, periodic cholinergic activation might be equivalent to an upsurge of libidinal energy, which might in turn excite repressed wishes) such *post-hoc* constructions were lacking in crucial evidence. For example, Hobson pointed out that cholinergic arousal of the forebrain was actually 'motivationally neutral' (ibid., 1338). Following the publication of his critique in the *American Journal of Psychiatry*, together with his elegant alternative theory known as 'activation-synthesis' (Hobson & McCarley, 1977, McCarley & Hobson, 1977), the tide of scientific opinion turned decisively against Freud.

By the mid-1990s, however, new evidence emerged which revealed a substantial methodological error in Hobson's work. The error had been to conflate correlation with cause. When Dement & Kleitman noted the high correlation between REM sleep and dreaming, they did so against the backdrop of a century of neuropsychology in which a standard method for determining the brain basis of mental functions had been established. This was to observe whether ablation of the postulated brain mechanism caused loss of the relevant function. Surprisingly, this method had never been applied to dreams. Jouvet and others (e.g. B. Jones, 1979) had indeed demonstrated a causal link between pontine brain lesion and loss of REM sleep, but they did not demonstrate a concomitant loss of dreaming – for the simple reason that non-human animals cannot report their subjective states. Because dreaming and REM sleep are highly correlated in humans, it had been assumed that loss of the one function implied loss of the other. But it turned out that it did not. When Mark Solms (1997*b*) conducted the requisite studies, he found that dreaming was only lost with damage to certain *forebrain* structures. This established a 'double dissociation' between REM sleep and dreaming (Solms, 2000*b*) – which also made sense of several troubling, earlier observations to the effect that roughly 20% of dreams occur during non-REM sleep, typically at sleep-onset and in the rising morning phase of the diurnal rhythm. Some form of forebrain arousal (and not uniquely REM arousal) was evidently necessary for dreaming, but the arousal was not sufficient; something else had to be added before dreaming occurs.

This 'something else' turned out to be, in effect, the mechanism postulated by Freud. The lesion studies had pointed to a pathway in the ventromesial quadrant of the frontal lobes (Solms, 1997*b*). Functional neuro-imaging studies then suggested that this pathway might be the brain's 'reward' circuit (Nofzinger et al., 1997) – also known as the SEEKING or 'wanting' system (Panksepp, 1998, Berridge, 1996) – a dopamine-mediated circuit that underpins appetitive behaviour in mammals. Confirmation that this pathway was robustly activated in dreaming sleep was soon forthcoming, when research by almost every conceivable method – pharmacological challenge (Hartmann et al., 1980), single-cell recording (Dahan et al., 2007) and microdialysis (Lena et al., 2005) – demonstrated that the dreaming brain is in a state of heightened appetitive arousal. The state of the brain's instinctual circuitry during dreaming sleep turns out to be 'similar to the activity measured during the consumption of palatable food' (Dahan et al., 2007, 1232).

The lesion findings, microdialysis research and functional neuro-imaging studies (Braun et al., 1997) also revealed something else, namely that the highest cortical mechanisms, which normally inhibit instinctual emotions in favour of executive cognition in waking life, are *deactivated* during dreaming sleep. Dreaming sleep is a state in which the focus of cortical activation regresses from the frontal parts of the

brain that regulate voluntary waking cognition and action on to the back parts that mediate perception and memory. As Freud wrote on p. 478 below, quoting Fechner, 'the scene of action of dreams is different from that of waking ideational life'.

The currently authoritative view of dreams, then, is remarkably compatible with the hypotheses that Freud advanced in this book. Dreaming is a hallucinatory state in which executive control of cognition is greatly diminished and instinctual emotion is greatly increased, but where the subject is prevented from acting on his impulses due to motor paralysis (Solms, 2011, 2013*b*). The conclusion that this regressive hallucinatory state is generated *because* the dreamer would otherwise be inclined to act in reality, and therefore wake up – i.e. that dreams are the guardians of sleep – remains compelling.

4. *The Present English Edition*

The present translation is based on the eighth (1930) German edition, the last published during its author's life. When first published in the *SE* in 1953, it differed from all previous editions (both German and English) in an important respect, for it is in the nature of a 'Variorum' edition. An effort has been made to indicate, with dates, every alteration of substance introduced into the book since its first issue. Wherever material has been dropped or greatly modified in later editions, the cancelled pas-
[xxi] sage or earlier version is given in a footnote. The only exception is that Rank's two appendices to Chapter VI have been omitted. The question of their inclusion was seriously considered; but it was decided against doing so. The essays are entirely self-contained and have no direct connections with Freud's book; they would have filled another fifty pages or so; and they would be particularly unenlightening to English readers, since they deal in the main with German literature and German mythology.

The bibliographies have been entirely recast. The first of these contains a list of every work actually referred to in the text or footnotes. The second bibliography contains all the works in the German pre-1900 list *not* actually quoted by Freud. It has seemed worthwhile to print this, since no other comparably full bibliography of the older literature on dreams is easily accessible. Writings after 1900, apart from those actually quoted and consequently included in the first bibliography, have been disregarded. A warning must, however, be issued in regard to both our lists. Investigation has shown a very high proportion of errors in the German bibliographies. These have been corrected wherever possible; but quite a number of the entries have proved to be untraceable in London, and these (which are distinguished by an asterisk) must be regarded as suspect.

Editorial additions are printed in square brackets. Many readers will no doubt be irritated by the number of references and other explanatory notes. The references, however, are essentially to Freud's own writings, and very few will be found to other authors (apart, of course, from references made by Freud himself). In any case, the fact must be faced that *The Interpretation of Dreams* is one of the major classics of scientific literature and it must be treated as such. It is the Editors' hope and belief that actually the references, and more particularly the cross-references to other parts of the work itself, will make it easier for serious students to follow the

intricacies of the material. Readers in search of mere entertainment – if there are any such – must steel themselves to disregard these parentheses.

A word must be added upon the translation itself. Great attention has had, of course, to be paid to the details of the wording of the text of dreams. Where the [xxii] English rendering strikes the reader as unusually stiff, he may assume that the stiffness has been imposed by some verbal necessity determined by the interpretation that is to follow. Where there are inconsistencies between different versions of the text of the same dream, he may assume that there are parallel inconsistencies in the original. These verbal difficulties culminate in the fairly frequent instances in which an interpretation depends entirely upon a pun. There are three methods of dealing with such situations. The translator can omit the dream entirely, or he can replace it with another parallel dream, whether derived from his own experience or fabricated *ad hoc*. These two methods have been the ones adopted in the main in the earlier translations of the book. But there are serious objections to them. We must once more remember that we are dealing with a scientific classic. What we want to hear about are the examples chosen by Freud – not by someone else. Accordingly, the present translators have adopted the pedantic and tiresome third alternative of keeping the original German pun and laboriously explaining it in a square bracket or footnote. Any amusement that might be got out of it completely evaporates in the process. But that, unfortunately, is a sacrifice that has to be made.

PREFACE [TO THE FIRST EDITION]

I have attempted in this volume to give an account of the interpretation of dreams; and in doing so I have not, I believe, trespassed beyond the sphere of interest covered by neuropathology.[1] For psychological investigation shows that the dream is the first member of a class of abnormal psychical phenomena of which further members, such as hysterical phobias, obsessions and delusions, are bound for practical reasons to be a matter of concern to physicians. As will be seen in the sequel, dreams can make no such claim to practical importance; but their theoretical value as a paradigm is on the other hand proportionately greater. Anyone who has failed to explain the origin of dream images can scarcely hope to understand phobias, obsessions or delusions or to bring a therapeutic influence to bear on them. [xxiii]

But the same correlation that is responsible for the importance of the subject must also bear the blame for the deficiencies of the present work. The broken threads which so frequently interrupt my presentation are nothing less than the many points of contact between the problem of the formation of dreams and the more comprehensive problems of psychopathology. These cannot be treated here, but, if time and strength allow and further material comes to hand, will form the subject of later communications.

The difficulties of presentation have been further increased by the peculiarities of the material which I have had to use to illustrate the interpreting of dreams. It will become plain in the course of the work itself why it is that none of the dreams already reported in the literature of the subject or collected from unknown sources could be of any use for my purposes. The only dreams open to my choice were my own and those of my patients undergoing psychoanalytic treatment. But I was precluded from using the latter material by the fact that in its case the dream processes were subject to an undesirable complication owing to the added presence of neurotic features. But if I was to report my own

1 [Older usage of the term 'neuropathology' is equivalent to the modern usage of 'neurology'.]

dreams, it inevitably followed that I should have to reveal to the public
[xxiv] gaze more of the intimacies of my mental life than I liked, or than is normally necessary for any writer who is a man of science and not a poet. Such was the painful but unavoidable necessity; and I have submitted to it rather than totally abandon the possibility of giving the evidence for my psychological findings. Naturally, however, I have been unable to resist the temptation of taking the edge off some of my indiscretions by omissions and substitutions. But whenever this has happened, the value of my instances has been very definitely diminished. I can only express a hope that readers of this book will put themselves in my difficult situation and treat me with indulgence, and further, that anyone who finds any sort of reference to himself in my dreams may be willing to grant me the right of freedom of thought – in my dream life, if nowhere else.

PREFACE TO THE SECOND EDITION

If within ten years of the publication of this book (which is very far from being an easy one to read) a second edition is called for, this is not due to the interest taken in it by the professional circles to whom my original Preface was addressed. My psychiatric colleagues seem to have taken no trouble to overcome the initial bewilderment created by my new approach to dreams. The professional philosophers have become accustomed to polishing off the problems of dream life (which they treat as a mere appendix to conscious states) in a few sentences – and usually in the same ones; and they have evidently failed to notice that we have something here from which a number of inferences can be drawn that are bound to transform our psychological theories. The attitude adopted by reviewers in the scientific periodicals could only lead one to suppose that my work was doomed to be sunk into complete silence; while the small group of gallant supporters, who practise medical psychoanalysis under my guidance and who follow my example in interpreting dreams and make use of their interpretations in treating neurotics, would never have exhausted the first edition of the book. Thus it is that I feel indebted to a wider circle of educated and curious-minded readers, whose interest has led me to take up once more after nine years this difficult, but in many respects fundamental, work. [xxv]

I am glad to say that I have found little to change in it. Here and there I have inserted some new material, added some fresh points of detail derived from my increased experience, and at some few points recast my statements. But the essence of what I have written about dreams and their interpretation, as well as about the psychological theorems to be deduced from them – all this remains unaltered: subjectively at all events, it has stood the test of time. Anyone who is acquainted with my other writings (on the aetiology and mechanism of the psychoneuroses) will know that I have never put forward inconclusive opinions as though they were established facts, and that I have always sought to modify my statements so that they may keep in step with my advancing knowledge. In

[xxvi] the sphere of dream life I have been able to leave my original assertions unchanged. During the long years in which I have been working at the problems of the neuroses I have often been in doubt and sometimes been shaken in my convictions. At such times it has always been *The Interpretation of Dreams* that has given me back my certainty. It is thus a sure instinct [*Instinkt*][T] which has led my many scientific opponents to refuse to follow me more especially in my researches upon dreams.

An equal durability and power to withstand any far-reaching alterations during the process of revision has been shown by the *material* of the book, consisting as it does of dreams of my own which have for the most part been overtaken or made valueless by the march of events and by which I illustrated the rules of dream interpretation. For this book has a further subjective significance for me personally – a significance which I only grasped after I had completed it. It was, I found, a portion of my own self-analysis, my reaction to my father's death – that is to say, to the most important event, the most poignant loss, of a man's life. Having discovered that this was so, I felt unable to obliterate the traces of the experience.[1] To my readers, however, it will be a matter of indifference upon what particular material they learn to appreciate the importance of dreams and how to interpret them.

Wherever I have found it impossible to incorporate some essential addition into the original context, I have indicated its more recent date by enclosing it in square brackets.[2]

Berchtesgaden, Summer, 1908

1 [Freud's father died in 1896. Some account of his feelings at the time can be found in his letter to Fliess of November 2, 1896. (Freud, 1950*a*, Letter 50.)]

2 [*Footnote added* 1914:] In later editions [from the fourth onwards] these were omitted.

PREFACE TO THE THIRD EDITION

Nine years elapsed between the first and second editions of this book, [xxvii]
but after scarcely more than a single year a third edition has become necessary. This new turn of events may please me; but just as formerly I was unwilling to regard the neglect of my book by readers as evidence of its worthlessness, so I cannot claim that the interest which is now being taken in it is a proof of its excellence.

Even *The Interpretation of Dreams* has not been left untouched by the advance of scientific knowledge. When I wrote it in 1899, my 'theory of sexuality' [*Three Essays* (1905*d*), *RSE*, 7] was not yet in existence and the analysis of the more complicated forms of psychoneurosis was only just beginning. It was my hope that dream interpretation would help to make possible the psychological analysis of neuroses; since then a deeper understanding of neuroses has reacted in turn upon our view of dreams. The theory of dream interpretation has itself developed further in a direction on which insufficient stress had been laid in the first edition of this book. My own experience, as well as the works of Wilhelm Stekel and others, have since taught me to form a truer estimate of the extent and importance of symbolism in dreams (or rather in unconscious thinking). Thus in the course of these years much has accumulated which demands attention. I have endeavoured to take these innovations into account by making numerous interpolations in the text and by additional footnotes. If these additions threaten at times to burst the whole framework of the book or if I have not everywhere succeeded in bringing the original text up to the level of our present knowledge, I must ask the reader's indulgence for these deficiencies: they are the results and signs of the present increasingly rapid development of our science. I may even venture to prophesy in what other directions later editions of this book – if any should be needed – will differ from the present one. They will have, on the one hand, to afford a closer contact with the copious material presented in imaginative writing, in myths, in linguistic usage and in folklore; while, on the other hand, they will have to deal in greater [xxviii]

detail than has here been possible with the relations of dreams to neuroses and mental diseases.

Herr Otto Rank has given me valuable assistance in selecting the additional matter and has been entirely responsible for correcting the proofs. I owe my thanks to him and to many others for their contributions and corrections.

Vienna, Spring, 1911

PREFACE TO THE FOURTH EDITION

Last year (1913) Dr A. A. Brill of New York produced an English translation of this book (*The Interpretation of Dreams*, G. Allen & Co., London).

On this occasion Dr Otto Rank has not only corrected the proofs but has also contributed two self-contained chapters to the text – the appendices to Chapter VI.

Vienna, June, 1914

PREFACE TO THE FIFTH EDITION

[xxix] Interest in *The Interpretation of Dreams* has not flagged even during the World War, and while it is still in progress a new edition has become necessary. It has not been possible, however, to notice fully publications since 1914; neither Dr Rank nor I have any knowledge of foreign works since that date.

A Hungarian translation, prepared by Dr Hollós and Dr Ferenczi, is on the point of appearing. In 1916–17 my *Introductory Lectures on Psychoanalysis* were published in Vienna by Hugo Heller. The central section of these, comprising eleven lectures, is devoted to an account of dreams which aims at being more elementary and at being in closer contact with the theory of the neuroses than the present work. On the whole it is in the nature of an epitome of *The Interpretation of Dreams*, though at certain points it enters into greater detail.

I have not been able to bring myself to embark upon any fundamental revision of this book, which might bring it up to the level of our present psychoanalytic views but would on the other hand destroy its historic character. I think, however, that after an existence of nearly twenty years it has accomplished its task.

Budapest-Steinbruch, July, 1918

PREFACE TO THE SIXTH EDITION

Owing to the difficulties in which the book trade is placed at present, this new edition has long been in demand, and the preceding edition has, for the first time, been reprinted without any alterations. Only the bibliography at the end of the volume has been completed and brought up to date by Dr Otto Rank.

Thus my assumption that after an existence of nearly twenty years this book had accomplished its task has not been confirmed. On the contrary, I might say that it has a new task to perform. If its earlier function was to offer some information on the nature of dreams, now it has the no less important duty of dealing with the obstinate misunderstandings to which that information is subject. [xxx]

Vienna, April, 1921

PREFACE TO THE EIGHTH EDITION

[xxxi] During the interval between the publication of the last (seventh) edition of this book in 1922 and the present one, my *Gesammelte Schriften* [Collected Writings] have been issued in Vienna by the Internationaler Psychoanalytischer Verlag. The second volume of that collection consists of an exact reprint of the first edition of *The Interpretation of Dreams*, while the third volume contains all the additions that have since been made to it. The translations of the book which have appeared during the same interval are based upon the usual, single-volume, form of the work: a French one by I. Meyerson published under the title of *La science des rêves* in the 'Bibliothèque de Philosophie Contemporaine' in 1926; a Swedish one by John Landquist, *Drömtydning* (1927); and a Spanish one by Luis López-Ballesteros y de Torres [1922], which occupies Volumes VI and VII of the *Obras Completas*. The Hungarian translation, which I thought was on the point of completion as long ago as in 1918, has even now not appeared.[1]

In the present revised edition of the work I have again treated it essentially as an historic document and I have only made such alterations in it as were suggested by the clarification and deepening of my own opinions. In accordance with this, I have finally given up the idea of including a list of works on the problems of dreams published since the book's first appearance, and that section has now been dropped. The two essays which Otto Rank contributed to earlier editions, on 'Dreams and Creative Writing' and 'Dreams and Myths', have also been omitted.

Vienna, December, 1929

1 [It was published in 1934. – During Freud's lifetime, in addition to the translations mentioned in these Prefaces, a Russian version appeared in 1913, a Japanese one in 1930 and a Czech one in 1938.]

PREFACE TO THE THIRD (REVISED) ENGLISH EDITION[1]

In 1909 G. Stanley Hall invited me to Clark University, in Worcester, to give the first lectures on psychoanalysis.[2] In the same year Dr Brill published the first of his translations of my writings, which were soon followed by further ones. If psychoanalysis now plays a role in American intellectual life, or if it does so in the future, a large part of this result will have to be attributed to this and other activities of Dr Brill's. [xxxii]

His first translation of *The Interpretation of Dreams* appeared in 1913. Since then much has taken place in the world, and much has been changed in our views about the neuroses. This book, with the new contribution to psychology which surprised the world when it was published (1900), remains essentially unaltered. It contains, even according to my present-day judgement, the most valuable of all the discoveries it has been my good fortune to make. Insight such as this falls to one's lot but once in a lifetime.

Vienna, March 15, 1931

1 [This is reprinted from the 1932 English edition. It was not included in the older German editions, as no German text was extant. However, a translation by Ilse Grubrich-Simitis was published in 1987 in the *Nachtragsband* to the *Gesammelte Werke*, p. 746.]

2 [*Five Lectures on Psychoanalysis* (1910*a*), *RSE*, **11**, 11 ff.]

I

THE SCIENTIFIC LITERATURE DEALING WITH THE PROBLEMS OF DREAMS[1]

In the pages that follow I shall bring forward proof that there is a psychological technique which makes it possible to interpret dreams, and that, if that procedure is employed, every dream reveals itself as a psychical structure [*Gebilde*][T] which has a meaning and which can be inserted at an assignable point in the mental [*seelische*][T] activities of waking life. I shall further endeavour to elucidate the processes to which the strangeness and obscurity of dreams are due and to deduce from those processes the nature of the psychical forces [*Kräfte*][T] by whose concurrent or mutually opposing action dreams are generated. Having gone thus far, my description will break off, for it will have reached a point at which the problem of dreams merges into more comprehensive problems, the solution to which must be approached upon the basis of material of another kind. [1] *Seele*

I shall give by way of preface a review of the work done by earlier writers on the subject as well as of the present position of the problems of dreams in the world of science, since in the course of my discussion I shall not often have occasion to revert to those topics. For, in spite of many thousands of years of effort, the scientific understanding of dreams has made very little advance – a fact so generally admitted in the literature that it seems unnecessary to quote instances in support of it. In these writings, of which a list appears at the end of my work, many stimulating observations are to be found and a quantity of interesting material bearing upon our theme, but little or nothing that touches upon the essential nature of dreams or that offers a final solution to any of their enigmas. And still less, of course, has passed into the knowledge of educated laymen.

1 [*Footnote added* in second to seventh editions:] Up to the date of the first publication of this book (1900).

It may be asked[1] what view [*Auffassung*][T] was taken of dreams in pre-
[2] historic times by primitive races of men and what effect dreams may have had upon the formation of their conceptions of the world and of the soul; and this is a subject of such great interest that it is only with much reluctance that I refrain from dealing with it in this connection. I must refer my readers to the standard works of Sir John Lubbock, Herbert Spencer, E. B. Tylor and others, and I will add only that we shall not be able to appreciate the wide range of these problems and speculations until we have dealt with the task that lies before us here – the interpretation of dreams.

The prehistoric view of dreams is no doubt echoed in the attitude adopted towards dreams by the peoples of classical antiquity.[2] They took it as axiomatic that dreams were connected with the world of superhuman beings in whom they believed and that they were revelations from gods and demons. There could be no question, moreover, that for the dreamer dreams had an important purpose, which was as a rule to foretell the future. The extraordinary variety in the content of dreams and in the impression they produced made it difficult, however, to have any uniform view of them and made it necessary to classify dreams into numerous groups and subdivisions according to their importance and trustworthiness. The position adopted towards dreams by individual philosophers in antiquity was naturally dependent to some extent upon their attitude towards divination in general.

In the two works of Aristotle which deal with dreams, they have already become a subject for psychological study. We are told that dreams are not sent by the gods and are not of a divine character, but that they are 'demonic', since nature is 'demonic' and not divine. Dreams, that is, do not arise from supernatural manifestations but follow the laws of the human spirit [*Geistes*], though the latter, it is true, is akin to the divine. Dreams are defined as the mental activity of the sleeper insofar as he is asleep.[3]

1 [This paragraph and the next were added in 1914.]

2 [*Footnote added* 1914:] What follows is based on Büchsenschütz's scholarly study (1868).

3 [*De divinatione per somnum*, II (*Trans*., 1935, 377), and *De somniis*, III (*Trans*., 1935, 365). – In the first edition (1900) this paragraph ran: 'The first work in which dreams were treated as a subject for psychological study seems to be that of Aristotle (*On Dreams and their Interpretation*). Aristotle declares that dreams are of a "demonic" but not of a "divine" nature; no doubt this distinction has some great significance if we knew how to translate it correctly.' The next paragraph ended with the sentence: 'My own insufficient knowledge and my lack of specialist assistance prevent my entering more deeply into Aristotle's treatise.' These passages were altered into their present form in 1914; and a note in *Gesammelte Schriften*, **3** (1925), 4, points out that, in fact, Aristotle wrote not one but two works on the subject.]

Aristotle was aware of some of the characteristics of dream life. He [3]
knew, for instance, that dreams give a magnified construction to small stimuli arising during sleep. 'Men think that they are walking through fire and are tremendously hot, when there is only a slight heating about certain parts.'[1] And from this circumstance he draws the conclusion that dreams may very well betray to a physician the first signs of some bodily change which has not been observed in waking.[2]

Before the time of Aristotle, as we know, the ancients regarded dreams not as a product of the dreaming mind but as something introduced by a divine agency; and already the two opposing currents, which we shall find influencing opinions of dream life at every period of history, were making themselves felt. The distinction was drawn between truthful and valuable dreams, sent to the sleeper to warn him or foretell the future, and vain, deceitful and worthless dreams, whose purpose it was to mislead or destroy him.

Gruppe (1906, **2**, 390)[3] quotes a classification of dreams on these lines made by Macrobius and Artemidorus [of Daldis (see p. 88 *n.* 1 below)]: 'Dreams were divided into two classes. One class was supposed to be influenced by the present or past, but to have no future significance. It included the *ἐνύπνια* or *insomnia*, which gave a direct representation of a given idea [*Vorstellung*]^{T} or of its opposite – e.g. of hunger or of its satiation – and the *φαντάσματα*, which lent a fantastic extension to the given idea – e.g. the nightmare or *ephialtes*. The other class, on the contrary, was supposed to determine the future. It included (1) direct prophecies received in a dream (the *χρηματισμός* or *oraculum*), (2) previsions of some future event (the *ὅραμα* or *visio*) and (3) symbolic dreams, which needed interpretation (the *ὄνειρος* or *somnium*). This theory persisted for many centuries.'

This variation in the value that was to be assigned to dreams[4] was [4]
closely related to the problem of 'interpreting' [*Traumdeutung*]^{T} them. *Deutung*
Important consequences were in general to be expected from dreams. But dreams were not all immediately comprehensible and it was impossible to tell whether a particular unintelligible dream might not be making some important announcement. This provided an incentive for elaborating a method by which the unintelligible content of a dream

1 [*De divinatione*, I (*Trans.*, 1935, 375).]

2 [*Footnote added* 1914:] The Greek physician Hippocrates deals with the relation of dreams to illnesses in one of the chapters of his famous work [*Ancient Medicine*, X (*Trans.*, 1923, 31). See also *Regimen*, IV, 88, *passim*. (*Trans.*, 1931, 425, etc.)]

3 [This paragraph was added as a footnote in 1911 and included in the text in 1914.]

4 [This paragraph was added in 1914.]

might be replaced with one that was comprehensible and significant. In the later years of antiquity Artemidorus of Daldis was regarded as the greatest authority on the interpretation of dreams, and the survival of his exhaustive work [*Oneirocritica*] must compensate us for the loss of the other writings on the same subject.[1]

The prescientific view of dreams adopted by the peoples of antiquity was certainly in complete harmony with their view of the universe in general, which led them to project into the external world as though they were realities things which in fact enjoyed reality only within their own minds. Moreover, their view of dreams took into account the principal impression produced upon the waking mind in the morning by what is left of a dream in the memory: an impression of something alien, arising from another world and contrasting with the remaining contents of the mind. Incidentally, it would be a mistake to suppose that the theory of the supernatural origin of dreams is without its supporters in our own days. We may leave on one side pietistic and mystical writers, who, indeed, are perfectly justified in remaining in occupation of what is left of the once wide domain of the supernatural so long as that field is not conquered by scientific explanation. But apart from them, one comes across clear-headed men, without any extravagant ideas, who
[5] seek to support their religious faith in the existence and activity of superhuman spiritual forces precisely by the inexplicable nature of the phenomena of dreaming. (Cf. Haffner, 1887.) The high esteem in which dream life is held by some schools of philosophy (by the followers of Schelling,[2] for instance) is clearly an echo of the divine nature of dreams which was undisputed in antiquity. Nor are discussions of the premonitory character of dreams and their power to foretell the future at an end. For attempts at giving a psychological explanation have been inadequate to cover the material collected, however decidedly the sympathies of those of a scientific cast of mind may incline against accepting any such beliefs.

1 [*Footnote added* 1914:] For the further history of dream interpretation in the Middle Ages see Diepgen (1912) and the monographs of Förster (1910 and 1911), Gotthardt (1912), etc. Dream interpretation among the Jews has been discussed by Almoli (1848), Amram (1901) and Löwinger (1908); also, quite recently and taking account of psychoanalytic findings, by Lauer (1913). Information upon dream interpretation among the Arabs has been given by Drexl (1909), Schwarz (1913) and the missionary Tfinkdji (1913); among the Japanese by Miura (1906) and Iwaya (1902); among the Chinese by Secker (1910); and among the people of India by Negelein (1912).

2 [The chief exponent of the pantheistic 'Philosophy of Nature', popular in Germany during the early part of the nineteenth century. – Freud often returned to the question of the occult significance of dreams. Cf. Freud, 1922*a*, 1925*i* (Part 3) and 1933*a* (Lecture XXX). An allegedly premonitory dream is discussed in Freud, 1941*c* [1899], printed as an Appendix to this work, p. 562 ff. See also pp. 57 and 555 below.]

It is difficult to write a history of the scientific study of the problems of dreams because, however valuable that study may have been at a few points, no line of advance in any particular direction can be traced. No foundation has been laid of secure findings upon which a later investigator might build; but each new writer examines the same problems afresh and begins again, as it were, from the beginning. If I attempted to take those who have written on the question in chronological order and to give a summary of their views upon the problems of dreams, I should have to abandon any hope of giving a comprehensive general picture of the present state of knowledge of the subject. I have therefore chosen to frame my account according to topics rather than authors and, as I raise each dream problem in turn, I shall bring forward whatever material the literature contains for its solution.

Since, however, it has been impossible for me to cover the whole of the literature of the subject, widely scattered as it is and trenching upon many other fields, I must ask my readers to be satisfied so long as no fundamental fact and no important point of view is overlooked in my description.

Until recently most writers on the subject have felt obliged to treat sleep and dreams as a single topic, and as a rule they have dealt in addition with analogous conditions on the fringe of pathology, and dreamlike [6]
states, such as hallucinations, visions and so on. The latest works, on the contrary, show a preference for a restricted theme and take as their subject, perhaps, some isolated question in the field of dream life. I should be glad to see in this change of attitude the expression of a conviction that in such obscure matters it will only be possible to arrive at explanations and agreed results by a series of detailed investigations. A piece of detailed research of that kind, predominantly psychological in character, is all I have to offer in these pages. I have had little occasion to deal with the problem of sleep, for that is essentially a problem of physiology, even though one of the characteristics of the state of sleep must be that it brings about modifications in the conditions of functioning of the mental apparatus. The literature on the subject of sleep is accordingly disregarded in what follows.

The questions raised by a scientific enquiry into the phenomena of dreams as such may be grouped under the headings which follow, though a certain amount of overlapping cannot be avoided.

(A)
THE RELATION OF DREAMS TO WAKING LIFE

[7] The unsophisticated waking judgement of someone who has just woken from sleep assumes that his dreams, even if they did not themselves come from another world, had at all events carried him off into another world. The old physiologist Burdach (1838, 499), to whom we owe a careful and shrewd account of the phenomena of dreams, has given expression to this conviction in a much-quoted passage: 'In dreams, daily life, with its labours and pleasures, its joys and pains, is never repeated. On the contrary, dreams have as their very aim to free us from it. Even when our whole mind has been filled with something, when we are torn by some deep sorrow or when all our intellectual power is absorbed in some problem, a dream will do no more than enter into the tone of our mood and represent reality in symbols.' I. H. Fichte (1864, **1**, 541), in the same sense, actually speaks of 'complementary dreams' and describes them as one of the secret benefactions of the self-healing nature of the spirit.[1] Strümpell (1877, 16) writes to similar effect in his study on the nature and origin of dreams – a work which is widely and deservedly held in high esteem: 'A man who dreams is removed from the world of waking consciousness.' So too (ibid., 17): 'In dreams our memory of the ordered contents of waking consciousness and of its normal behaviour is as good as completely lost.' And again (ibid., 19) he writes that 'the mind is cut off in dreams, almost without memory, from the ordinary content and affairs of waking life'.

The preponderant majority of writers, however, take a contrary view of the relation of dreams to waking life. Thus Haffner (1887, 245): 'In the first place, dreams carry on waking life. Our dreams regularly attach themselves to the ideas that have been in our consciousness shortly before. Accurate observation will almost always find a thread which connects a dream with the experiences of the previous day.' Weygandt (1893, 6) specifically contradicts Burdach's statement which I have just
[8] quoted: 'For it may often, and apparently in the majority of dreams, be observed that they actually lead us back to ordinary life instead of freeing us from it.' Maury (1878, 51) advances a concise formula: 'Nous

1 [This sentence was added in 1914.]

rêvons de ce que nous avons vu, dit, désiré ou fait';[1] while Jessen, in his book on psychology (1855, 530), remarks at somewhat greater length: 'The content of a dream is invariably more or less determined by the individual personality of the dreamer, by his age, sex, class, standard of education and habitual way of living, and by the events and experiences of his whole previous life.'

The most uncompromising attitude on this question[2] is adopted by J. G. E. Maass, the philosopher (1805, [**1**, 168 and 173]), quoted by Winterstein (1912): 'Experience confirms our view that we dream most frequently of the things on which our warmest passions are centred. And this shows that our passions must have an influence on the production of our dreams. The ambitious man dreams of the laurels he has won (or imagines he has won) or of those he has still to win; while the lover is busied in his dreams with the object of his sweet hopes. . . . All the sensual desires and repulsions that slumber in the heart can, if anything sets them in motion, cause a dream to arise from the ideas that are associated with them or cause those ideas to intervene in a dream that is already present.'

The same view was taken in antiquity on the dependence of the content of dreams upon waking life. Radestock (1879, 134) tells us how before Xerxes started on his expedition against Greece, he was given sound advice of a discouraging kind but was always urged on again by his dreams; whereupon Artabanus, the sensible old Persian interpreter of dreams, observed to him pertinently that as a rule dream pictures contain what the waking man already thinks.

Lucretius' didactic poem *De rerum natura* contains the following passage (IV, 962):

> Et quo quisque fere studio devinctus adhaeret
> aut quibus in rebus multum sumus ante morati
> atque in ea ratione fuit contenta magis mens,
> in somnis eadem plerumque videmur obire;
> causidici causas agere et componere leges,
> induperatores pugnare ac proelia obire . . .[3]

1 ['We dream of what we have seen, said, desired or done.']

2 [This paragraph was added in 1914.]

3 ['And whatever be the pursuit to which one clings with devotion, whatever the things on which we have been occupied much in the past, the mind being thus more intent upon that pursuit, it is generally the same things that we seem to encounter in dreams: pleaders to plead their cause and collate laws, generals to contend and engage battle . . .' (Rouse's translation in the Loeb Classical Library, 1924, 317.)]

[9] Cicero (*De divinatione*, II, lxvii, 140) writes to exactly the same effect as Maury so many years later: 'Maximeque reliquiae rerum earum moventur in animis et agitantur de quibus vigilantes aut cogitavimus aut egimus.'[1]

The contradiction between these two views upon the relation between dream life and waking life seems in fact insoluble. It is therefore relevant at this point to recall the discussion of the subject by Hildebrandt (1875, 8 ff.), who believes that it is impossible to describe the characteristics of dreams at all except by means of 'a series of [three] contrasts which seem to sharpen into contradictions'. 'The *first* of these contrasts', he writes, 'is afforded on the one hand by the *completeness* with which dreams are *secluded and separated* from real and actual life and on the other hand by their constant *encroachment* upon each other and their constant mutual dependence. A dream is something completely severed from the reality experienced in waking life, something, as one might say, with a hermetically sealed existence of its own, and separated from real life by an impassable gulf. It sets us free from reality, extinguishes our normal memory of it and places us in another world and in a quite other life story which in essentials has nothing to do with our real one. . . .' Hildebrandt goes on to show how when we fall asleep our whole being with all its forms of existence 'disappears, as it were, through an invisible trapdoor'. Then, perhaps, the dreamer may make a sea voyage to St Helena in order to offer Napoleon, who is a prisoner there, a choice bargain in Moselle wines. He is received most affably by the ex-Emperor and feels almost sorry when he wakes and the interesting illusion is destroyed. But let us compare the situation in the dream, proceeds Hildebrandt, with reality. The dreamer has never been a wine merchant and has never wished to be. He has never gone on a sea voyage, and if he did, St Helena would be the last place he would choose to go to. He nourishes no sympathetic feelings whatever towards Napoleon, but on the contrary a fierce patriotic hatred. And, on top of
[10] all the rest, the dreamer was not even born when Napoleon died on the island; so that to have any personal relations with him was beyond the bounds of possibility. Thus the dream experience appears as something alien inserted between two sections of life which are perfectly continuous and consistent with each other.

'And yet,' continues Hildebrandt [ibid., 10], 'what appears to be the *contrary* of this is equally true and correct. In spite of everything, the

1 ['Then especially do the remnants of our waking thoughts and deeds move and stir within the soul.' (Falconer's translation in the Loeb Classical Library, 1922, 527.)]

most intimate relationship goes hand in hand, I believe, with the seclusion and separation. We may even go so far as to say that whatever dreams may offer, they derive their material from reality and from the intellectual life that revolves around that reality. . . . Whatever strange results they may achieve, they can never in fact get free from the real world; and their most sublime as well as their most ridiculous structures must always borrow their basic material either from what has passed before our eyes in the world of the senses or from what has already found a place somewhere in the course of our waking thoughts – in other words from what we have already experienced either externally or internally.'

(B)
THE MATERIAL OF DREAMS – MEMORY IN DREAMS

[11] All the material making up the content of a dream is in some way derived from experience, that is to say, has been reproduced or *remembered* in the dream – so much at least we may regard as an undisputed fact. But it would be a mistake to suppose that a connection of this kind between the content of a dream and reality is bound to come to light easily, as an immediate result of comparing them. The connection needs, on the contrary, to be looked for diligently, and in a whole quantity of cases it may long remain hidden. The reason for this lies in a number of peculiarities which are exhibited by the faculty of memory in dreams and which, though generally remarked upon, have hitherto resisted explanation. It will be worthwhile to examine these characteristics more closely.

It may happen that a piece of material occurs in the content of a dream which in the waking state we do not recognize as forming a part of our knowledge or experience. We remember, of course, having dreamt the thing in question, but we cannot remember whether or when we experienced it in real life. We are thus left in doubt as to the source which has been drawn upon by the dream and are tempted to believe that dreams have a power of independent production. Then at last, often after a long interval, some fresh experience recalls the lost memory of the other event and at the same time reveals the source of the dream. We are thus driven to admit that in the dream we knew and remembered something which was beyond the reach of our waking memory.[1]

A particularly striking example of this is given by Delboeuf [1885, 107 ff.] from his own experience. He saw in a dream the courtyard of his house covered with snow and found two small lizards half-frozen and buried under it. Being an animal lover, he picked them up, warmed them and
[12] carried them back to the little hole in the masonry where they belonged. He further gave them a few leaves of a small fern which grew on the wall and of which, as he knew, they were very fond. In the dream he knew the name of the plant: *Asplenium ruta muralis*. The dream

1 [*Footnote added* 1914:] Vaschide (1911) remarks that it has often been observed that in dreams people speak foreign languages more fluently and correctly than in waking life.

proceeded and, after a digression, came back to the lizards. Delboeuf then saw to his astonishment two new ones which were busy on the remains of the fern. He then looked round him and saw a fifth and then a sixth lizard making their way to the hole in the wall, until the whole roadway was filled with a procession of lizards, all moving in the same direction . . . and so on.

When he was awake, Delboeuf knew the Latin names of very few plants and an *Asplenium* was not among them. To his great surprise he was able to confirm the fact that a fern of this name actually exists. Its correct name is *Asplenium ruta muraria*, which had been slightly distorted in the dream. It was hardly possible that this could be a coincidence; and it remained a mystery to Delboeuf how he had acquired his knowledge of the name '*Asplenium*' in his dream.

The dream occurred in 1862. Sixteen years later, while the philosopher was on a visit to one of his friends, he saw a little album of pressed flowers of the sort that are sold to foreigners as mementos in some parts of Switzerland. A recollection began to dawn on him – he opened the herbarium, found the *Asplenium* of his dream and saw its Latin name written underneath it in his own handwriting. The facts could now be established. In 1860 (two years before the lizard dream) a sister of this same friend had visited Delboeuf on her honeymoon. She had with her the album, which was to be a gift to her brother, and Delboeuf took the trouble to write its Latin name under each dried plant, at the dictation of a botanist.

Good luck, which made this example so well worth recording, enabled Delboeuf to trace yet another part of the content of the dream to its forgotten source. One day in 1877 he happened to take up an old volume of an illustrated periodical and in it he found a picture of the whole procession of lizards which he had dreamt of in 1862. The volume was dated 1861 and Delboeuf remembered having been a subscriber to the paper from its first number.

The fact that dreams have at their command memories which are inaccessible in waking life is so remarkable and of such theoretical importance that I should like to draw still more attention to it by relating some further 'hypermnesic' dreams. Maury [1878, 142] tells us how for some time the word 'Mussidan' kept coming into his head during the day. He knew nothing about it except that it was the name of a town in France. One night he dreamt[t] that he was talking to someone who told him he came from Mussidan, and who, on being asked where that was, replied that it was a small town in the department of Dordogne. [13]

When he woke up, Maury had no belief in the information given him in the dream; he learnt from a gazetteer, however, that it was perfectly correct. In this case the fact of the dream's superior knowledge was confirmed, but the forgotten source of that knowledge was not discovered.

Jessen (1855, 551) reports a very similar event in a dream dating from remoter times: 'To this class belongs among others a dream of the elder Scaliger (quoted by Hennings, 1784, 300) who wrote a poem in praise of the famous men of Verona. A man who called himself Brugnolus appeared to him in a dream and complained that he had been overlooked. Although Scaliger could not remember having ever heard of him, he wrote some verses on him. His son learnt later in Verona that someone named Brugnolus had in fact been celebrated there as a critic.'

The Marquis d'Hervey de Saint-Denys [1867, 305],[1] quoted by Vaschide (1911, 232 f.), describes a hypermnesic dream which has a special peculiarity, for it was followed by another dream which completed the recognition of what was at first an unidentified memory: 'I once dreamt of a young woman with golden hair, whom I saw talking to my sister while showing her some embroidery. She seemed very familiar to me in the dream and I thought I had seen her very often before. After I woke up, I still had her face very clearly before me but I was totally unable to recognize it. I then went to sleep once more and the dream picture was repeated. . . . But in this second dream I spoke to the fair-haired lady and asked her if I had not had the pleasure of meeting her before somewhere. "Of course," she replied, "don't you remember the *plage* at Pornic?" I immediately woke up again and I was then able to recollect clearly all the details associated with the attractive vision in the dream.'

[14] The same author [ibid., 306] (quoted again by Vaschide, ibid., 233–4) tells how a musician of his acquaintance once heard in a dream a tune which seemed to him entirely new. It was not until several years later that he found the same tune in an old collected volume of musical pieces, though he still could not remember ever having looked through it before.

I understand that Myers [1892] has published a whole collection of hypermnesic dreams of this kind in the *Proceedings* of the Society for Psychical Research; but these are unluckily inaccessible to me.

No-one who occupies himself with dreams can, I believe, fail to discover that it is a very common event for a dream to give evidence of knowledge and memories which the waking subject is unaware of

1 [This paragraph and the next were added in 1914.]

possessing. In my psychoanalytic work with nervous patients, of which I shall speak later, I am in a position several times a week to prove to patients from their dreams that they are really quite familiar with quotations, obscene words and so on, and make use of them in their dreams, though they have forgotten them in their waking life. I will add one more innocent case of hypermnesia in a dream, because of the great ease with which it was possible to trace the source of the knowledge that was accessible only in the dream.

One of my patients dreamt in the course of a fairly lengthy dream that he had ordered a '*Kontuszówka*' while he was in a café. After telling me this, he asked me what a '*Kontuszówka*' was, as he had never heard the name. I was able to tell him in reply that it was a Polish liqueur, and that he could not have invented the name as it had long been familiar to me from advertisements on the hoardings. At first he would not believe me; but some days later, after making his dream come true in a café, he noticed the name on a hoarding at a street corner which he must have gone past at least twice a day for several months.

I have noticed myself[1] from my own dreams how much it is a matter of chance whether one discovers the source of particular elements of a dream. Thus, for several years before completing this book, I was pursued by the picture of a church tower of very simple design, which I could not remember ever having seen. Then I suddenly recognized it, with absolute certainty, at a small station on the line between Salzburg and Reichenhall. That was during the second half of the eighteen- [15]
nineties and I had travelled over the line for the first time in 1886. During later years, when I was already deeply absorbed in the study of dreams, the frequent recurrence in my dreams of the picture of a particular unusual-looking place became a positive nuisance to me. In a specific spatial relation to myself, on my left-hand side, I saw a dark space out of which there glimmered a number of grotesque sandstone figures. A faint recollection, which I was unwilling to credit, told me it was the entrance to a beer-cellar. But I failed to discover either the meaning of the dream picture or its origin. In 1907 I happened to be in Padua, which, to my regret, I had not been able to visit since 1895. My first visit to that lovely university town had been a disappointment, as I had not been able to see Giotto's frescoes in the Madonna dell' Arena. I had turned back halfway along the street leading there, on being told that the chapel was closed on that particular day. On my second visit, twelve years later, I decided to make up for this and the first thing I did was to

1 [This paragraph was added in 1909.]

set off towards the Arena chapel. In the street leading to it, on my left-hand side as I walked along and in all probability at the point at which I had turned back in 1895, I came upon the place I had seen so often in my dreams, with the sandstone figures that formed part of it. It was in fact the entrance to the garden of a restaurant.

One of the sources from which dreams derive material for reproduction – material which is in part neither remembered nor used in the activities of waking thought – is childhood experience. I will quote only a few of the authors who have noticed and stressed this fact.

Hildebrandt (1875, 23): 'I have already expressly admitted that dreams sometimes bring back to our minds, with a wonderful power of reproduction, very remote and even forgotten events from our earliest years.'

Strümpell (1877, 40): 'The position is even more remarkable when we observe how dreams sometimes bring to light, as it were, from beneath the deepest piles of debris under which the earliest experiences of youth are buried in later times, pictures of particular localities, things or people, completely intact and with all their original freshness. This is not limited to experiences which created a lively impression when they occurred or enjoy a high degree of psychical importance and return later [16] in a dream as genuine recollections at which waking consciousness will rejoice. On the contrary, the depths of memory in dreams also include pictures of people, things, localities and events dating from the earliest times, which either never possessed any psychical importance or more than a slight degree of vividness, or which have long since lost what they may have possessed of either, and which consequently seem completely alien and unknown alike to the dreaming and waking mind till their earlier origin has been discovered.'

Volkelt (1875, 119): 'It is especially remarkable how readily memories of childhood and youth make their way into dreams. Dreams are continually reminding us of things which we have ceased to think of and which have long ceased to be important to us.'

Since dreams have material from childhood at their command, and since, as we all know, that material is for the most part blotted out by gaps in our conscious faculty of memory, these circumstances give rise to interesting hypermnesic dreams, of which I will once more give a few examples.

Maury (1878, 92) relates how when he was a child he often used to go from Meaux, which was his birthplace, to the neighbouring village of Trilport, where his father was superintending the building of a bridge.

One night in a dream he found himself in Trilport and was once more playing in the village street. A man came up to him who was wearing a sort of uniform. Maury asked him his name and he replied that he was called C. and was a watchman at the bridge. Maury awoke feeling sceptical as to the correctness of the memory, and asked an old maidservant, who had been with him since his childhood, whether she could remember a man of that name. 'Why, yes,' was the reply, 'he was the watchman at the bridge when your father was building it.'

Maury (ibid., 143–4) gives another equally well-corroborated example of the accuracy of a memory of childhood emerging in a dream. It was dreamt by a Monsieur F., who as a child had lived at Montbrison. Twenty-five years after leaving it, he decided to revisit his home and some friends of the family whom he had not since met. During the night before his departure he dreamt that he was already at Montbrison and, near the town, met a gentleman whom he did not know by sight but who told him he was Monsieur T., a friend of his father's. The dreamer [17]
was aware that when he was a child he had known someone of that name, but in his waking state no longer remembered what he looked like. A few days later he actually reached Montbrison, found the locality which in his dream had seemed unknown to him, and there met a gentleman whom he at once recognized as the Monsieur T. in the dream. The real person, however, looked much older than he had appeared in the dream.

At this point I may mention a dream of my own, in which what had to be traced was not an impression but a connection. I had a dream of someone whom I knew in my dream was the doctor in my native town. His face was indistinct, but was confused with a picture of one of the masters at my secondary school, whom I still meet occasionally. When I woke up I could not discover what connection there was between these two men. I made some enquiries from my mother, however, about this doctor who dated back to the earliest years of my childhood, and learnt that he had only one eye. The schoolmaster whose figure had covered that of the doctor in the dream was also one-eyed. It was thirty-eight years since I had seen the doctor, and so far as I know I had never thought of him in my waking life, though a scar on my chin might have reminded me of his attentions.[1]

1 [The last clause of this sentence was added in 1909, appears in all later editions up to 1922, but was afterwards omitted. The reference to this same man on p. 244 below only makes sense if it alludes to this omitted clause. The accident that caused the scar is mentioned in the disguised autobiographical case history in Freud (1899*a*), *RSE*, **3**, 301, and the event itself is probably described below on p. 501. This dream plays an important part in a letter to Fliess of October 15, 1897 (Freud, 1950*a*, Letter 71), ibid., **1**, 290; it is also described in Freud (1916–17*a*), Lecture XIII, ibid., **15**, 175.]

A number of writers, on the other hand, assert that elements are to be found in most dreams, which are derived from the very last few days before they were dreamt; and this sounds like an attempt to counterbalance the laying of too much weight upon the part played in dream life by experiences in childhood. Thus Robert (1886, 46) actually declares that normal dreams are as a rule concerned only with the impressions of the past few days. We shall find, however, that the theory of dreams
[18] constructed by Robert makes it essential for him to bring forward the most recent impressions and leave the oldest out of sight. Nonetheless, the fact stated by him remains correct, as I am able to confirm from my own investigations. An American writer, Nelson [1888, 380 f.], is of the opinion that the impressions most frequently employed in a dream arise from the day next but one before the dream occurs, or from the day preceding that one – as though the impressions of the day *immediately* before the dream were not sufficiently attenuated or remote.

Several writers who are anxious not to cast doubts on the intimate connection between the content of dreams and waking life have been struck by the fact that impressions with which waking thoughts are intensely occupied only appear in dreams after they have been pushed somewhat aside by the workings of daytime thought. Thus, after the death of someone dear to them, people do not as a rule dream of him to begin with, while they are overwhelmed by grief (Delage, 1891, [40]). On the other hand, one of the most recent observers, Miss Hallam (Hallam & Weed, 1896, 410–11), has collected instances to the contrary, thus asserting the right of each of us to psychological individualism in this respect.

The third, most striking and least comprehensible characteristic of memory in dreams is shown in the *choice* of material reproduced. For what is found worth remembering is not, as in waking life, only what is most important, but on the contrary what is most indifferent and insignificant as well. On this point I will quote those writers who have given the strongest expression to their astonishment.

Hildebrandt (1875, 11): 'For the remarkable thing is that dreams derive their elements not from major and stirring events nor the powerful and compelling interests of the preceding day, but from incidental details, from the worthless fragments, one might say, of what has been recently experienced or of the remoter past. A family bereavement, which has moved us deeply and under whose immediate shadow we have fallen asleep late at night, is blotted out of our memory till with our first

waking moment it returns to it again with disturbing violence. On the other hand, a wart on the forehead of a stranger whom we met in the street and to whom we gave no second thought after passing him *has* a part to play in our dream. . . .'

Strümpell (1877, 39): 'There are cases in which the analysis of a dream [19] shows that some of its components are indeed derived from experiences of the previous day or its predecessor, but experiences so unimportant and trivial from the point of view of waking consciousness that they were forgotten soon after they occurred. Experiences of this kind include, for instance, remarks accidentally overheard, or another person's actions inattentively observed, or passing glimpses of people or things, or odd fragments of what one has read, and so on.'

Havelock Ellis (1899*a*, 727): 'The profound emotions of waking life, the questions and problems on which we spread our chief voluntary mental energy, are not those which usually present themselves at once to dream consciousness. It is, so far as the immediate past is concerned, mostly the trifling, the incidental, the "forgotten" impressions of daily life which reappear in our dreams. The psychic activities that are awake most intensely are those that sleep most profoundly.'

Binz (1878, 44–5) actually makes this particular peculiarity of memory in dreams the occasion for expressing his dissatisfaction with the explanations of dreams which he himself has supported: 'And the natural dream raises similar problems. Why do we not always dream of the mnemic impressions of the day we have just lived through? Why do we often, without any apparent motive, plunge instead into the remote and almost extinct past? Why does consciousness so often in dreams receive the impression of *indifferent* mnemic images, while the brain cells, just where they carry the most sensitive marks of what has been experienced, lie for the most part silent and still, unless they have been stirred into fresh activity shortly before, during waking life?'

It is easy to see how the remarkable preference shown by the memory in dreams for indifferent, and consequently unnoticed, elements in waking experience is bound to lead people to overlook in general the dependence of dreams upon waking life and at all events to make it difficult in any particular instance to prove that dependence. Thus Miss Whiton Calkins (1893, 315), in her statistical study of her own and her collaborator's dreams, found that in eleven per cent of the total there was no visible connection with waking life. Hildebrandt (1875, [12 f.]) is unquestionably right in asserting that we should be able to explain the genesis of every dream image if we devoted enough time and trouble to [20]

tracing its origin. He speaks of this as 'an exceedingly laborious and thankless task. For as a rule it ends in hunting out every kind of utterly worthless psychical event from the remotest corners of the chambers of one's memory, and in dragging to light once again every kind of completely indifferent moment of the past from the oblivion in which it was buried in the very hour, perhaps, after it occurred.' I can only regret that this keen-sighted author allowed himself to be deterred from following the path which had this inauspicious beginning; if he had followed it, it would have led him to the very heart of the explanation of dreams.

The way in which the memory behaves in dreams is undoubtedly of the greatest importance for any theory of memory in general. It teaches us that 'nothing which we have once mentally possessed can be entirely lost' (Scholz, 1893, 59); or, as Delboeuf [1885, 115] puts it, 'que toute impression même la plus insignifiante, laisse une trace inaltérable, indéfiniment susceptible de reparaître au jour'.[1] This is a conclusion to which we are also driven by many pathological phenomena of mental life. Certain theories about dreams which we shall mention later seek to account for their absurdity and incoherence by a partial forgetting of what we know during the day. When we bear in mind the extraordinary efficiency that we have just seen exhibited by memory in dreams we shall have a lively sense of the contradiction which these theories involve.

It might perhaps occur to us that the phenomenon of dreaming could be reduced entirely to that of memory: dreams, it might be supposed, are a manifestation of a reproductive activity which is at work even in the night and which is an end in itself. This would tally with statements such as those made by Pilcz (1899), according to which there is a fixed relation observable between the time at which a dream occurs and its content – impressions from the remotest past being reproduced in dreams during deep sleep, while more recent impressions appear towards morning. But views of this sort are inherently improbable owing to the manner in which dreams deal with the material that is to be remembered. Strümpell [1877, 18] rightly points out that dreams do
[21] not reproduce experiences. They take one step forward, but the next step in the chain is omitted, or appears in an altered form, or is replaced with something entirely extraneous. Dreams yield no more than *fragments* of reproductions; and this is so general a rule that theoretical

1 ['That even the most insignificant impression leaves an unalterable trace, which is indefinitely capable of revival.']

conclusions may be based on it. It is true that there are exceptional cases in which a dream repeats an experience with as much completeness as is attainable by our waking memory. Delboeuf [1885, 239 f.] tells how one of his university colleagues[1] had a dream which reproduced in all its details a dangerous carriage accident he had had, with an almost miraculous escape. Miss Calkins (1893) mentions two dreams whose content was an exact reproduction of an event of the previous day, and I shall myself have occasion later to report an example I came across of a childhood experience reappearing in a dream without modification. [See pp. 167 and 175 below.][2]

1 [In the first edition, the words 'who is now teaching in Vienna' appeared here but they were cut out in 1909. In *GS*, **3** (1925), 8, Freud remarks that 'the words were no doubt rightly omitted, especially as the man in question had died'.]

2 [*Footnote added* 1909:] Subsequent experience leads me to add that it by no means rarely happens that innocent and unimportant actions of the previous day are repeated in a dream: such, for instance, as packing a trunk, preparing food in the kitchen, and so on. What the dreamer is himself stressing in dreams of this kind is not, however, the content of the memory but the fact of its being 'real': 'I really *did* do all that yesterday.' [Cf. below, pp. 166 and 332–3. The topics discussed in this and the preceding section are taken up again in the first two sections of Chapter V (p. 144 ff. below).]

(C)
THE STIMULI AND SOURCES OF DREAMS

[22] There is a popular saying that 'dreams come from indigestion' and this helps us to see what is meant by the stimuli and sources of dreams. Behind these concepts lies a theory according to which dreams are a result of a disturbance of sleep: we should not have had a dream unless something disturbing had happened during our sleep, and the dream was a reaction to that disturbance.

Discussions upon the exciting causes of dreams occupy a very large space in the literature of the subject. The problem could obviously only arise after dreams had become a subject of biological investigation. The ancients, who believed that dreams were inspired by the gods, had no need to look around for their stimulus: dreams emanated from the will of divine or demonic powers and their content arose from the knowledge or purpose of those powers. Science was immediately faced with the question of whether the stimulus to dreaming was always the same or whether there could be many kinds of such stimuli; and this involved the consideration of whether the explanation of the causation of dreams fell within the province of psychology or rather of physiology. Most authorities seem to agree in assuming that the causes that disturb sleep – that is, the sources of dreaming – may be of many kinds and that somatic stimuli and mental excitations alike may come to act as instigators of dreams. Opinions differ widely, however, in the preference they show for one or the other source of dreams and in the order of importance which they assign to them as factors in the production of dreams.

Any complete enumeration of the sources of dreams leads to a recognition of four kinds of source; and these have also been used for the classification of dreams themselves. They are: (1) external (objective) sensory excitations; (2) internal (subjective) sensory excitations; (3) internal (organic) somatic stimuli; and (4) purely psychical sources of stimulation.

1. *External Sensory Stimuli*

The younger Strümpell [1883–4; Engl. trans. (1912, **2**, 160)],[1] the son of [23]
the philosopher whose book on dreams has already given us several hints upon their problems, published a well-known account of his observations upon one of his patients who was afflicted with general anaesthesia of the surface of his body and paralysis of several of his higher sense organs. If the few of this man's sensory channels which remained open to the external world were closed, he would fall asleep. Now when we ourselves wish to go to sleep we are in the habit of trying to produce a situation similar to that of Strümpell's experiment. We close our most important sensory channels, our eyes, and try to protect the other senses from all stimuli or from any modification of the stimuli acting on them. We then fall asleep, even though our plan is never completely realized. We cannot keep stimuli completely away from our sense organs nor can we completely suspend the excitability of our sense organs. The fact that a fairly powerful stimulus will awaken us at any time is evidence that 'even in sleep the soul is in constant contact with the extra-corporeal world'.[2] The sensory stimuli that reach us during sleep may very well become sources of dreams.

Now there are a great number of such stimuli, ranging from the unavoidable ones which the state of sleep itself necessarily involves or must tolerate from time to time, to the accidental, rousing stimuli which may or do put an end to sleep. A bright light may force its way into our eyes, or a noise may make itself heard, or some strong-smelling substance may stimulate the mucous membrane of our nose. By unintentional movements during our sleep we may uncover some part of our body and expose it to sensations of chill, or by a change in posture we may ourselves bring about sensations of pressure or contact. We may be stung by a gnat, or some small mishap during the night may impinge upon several of our senses at once. Attentive observers have collected a whole series of dreams in which there has been such a far-reaching correspondence between a stimulus noticed on waking and a portion of the content of the dream that it has been possible to identify the stimulus as the source of the dream.

I will quote from Jessen (1855, 527 f.) a collection of dreams of this kind [24]
which may be traced back to objective, and more or less accidental, sensory stimulation.

1 [Account first published 1878.]

2 [Cf. Burdach's remarks on p. 47 below.]

'Every noise that is indistinctly perceived arouses corresponding dream images. A peal of thunder will set us in the midst of a battle; the crowing of a cock may turn into a man's cry of terror; the creaking of a door may produce a dream of burglars. If our bedclothes fall off in the night, we may dream, perhaps, of walking about naked or of falling into water. If we are lying crosswise in bed and push our feet over the edge, we may dream that we are standing on the brink of a frightful precipice or that we are falling over a cliff. If our head happens to get under the pillow, we dream of being beneath a huge overhanging rock which is on the point of burying us under its weight. Accumulations of semen lead to lascivious dreams, local pains produce ideas of being ill-treated, attacked or injured. . . .

'Meier (1758, 33) once dreamt that he was overpowered by some men who stretched him out on his back on the ground and drove a stake into the earth between his big toe and the next one. While he was imagining this in the dream he woke up and found that a straw was sticking between his toes. On another occasion, according to Hennings (1784, 258), when Meier had fastened his shirt rather tight round his neck, he dreamt that he was being hanged. Hoffbauer [(1796, 146)] dreamt when he was a young man of falling down from a high wall, and when he woke up found that his bedstead had collapsed and that he had really fallen on to the floor. . . . [John] Gregory reports that once, when he was lying with his feet on a hot-water bottle, he dreamt he had climbed to the top of Mount Etna and that the ground there was intolerably hot. Another man, who was sleeping with a hot poultice on his head, dreamt that he was being scalped by a band of Red Indians; while a third, who was wearing a damp nightshirt, imagined that he was being dragged through a stream. An attack of gout that came on suddenly during sleep caused the patient to believe he was in the hands of the Inquisition and being tortured on the rack. (Macnish [1835, 40].)'

The argument based on the similarity between the stimulus and the content of the dream gains in strength if it is possible deliberately to convey a sensory stimulus to the sleeper and produce in him a dream
[25] corresponding to that stimulus. According to Macnish (loc. cit.), quoted by Jessen (1855, 529), experiments of this sort had already been made by Girou de Bouzareinges [1848, 55]. 'He left his knee uncovered and dreamt that he was travelling at night in a mail coach. He remarks upon this that travellers will no doubt be aware how cold one's knees become at night in a coach. Another time he left his head uncovered at the back and dreamt that he was taking part in a religious ceremony in the open

air. It must be explained that in the country in which he lived it was the custom always to keep the head covered except in circumstances such as these.'

Maury (1878, [154–6]) brings forward some new observations of dreams produced in himself. (A number of other experiments were unsuccessful.)

(1) His lips and the tip of his nose were tickled with a feather. – He dreamt of a frightful form of torture: a mask made of pitch was placed on his face and then pulled off, so that it took his skin off with it.

(2) A pair of scissors was sharpened on a pair of pliers. – He heard bells pealing, followed by alarm bells, and he was back in the June days of 1848.

(3) He was given some eau de cologne to smell. – He was in Cairo, in Johann Maria Farina's shop. Some absurd adventures followed, which he could not reproduce.

(4) He was pinched lightly on the neck. – He dreamt he was being given a mustard plaster and thought of the doctor who had treated him as a child.

(5) A hot iron was brought close to his face. – He dreamt that the '*chauffeurs*'[1] had made their way into the house and were forcing its inhabitants to give up their money by sticking their feet into braziers of hot coal. The Duchess of Abrantès, whose secretary he was in the dream, then appeared.

(8) A drop of water was dropped on his forehead. – He was in Italy, was sweating violently and was drinking white Orvieto wine.

(9) Light from a candle was repeatedly shone upon him through a sheet of red paper. – He dreamt of the weather and of the heat, and was once again in a storm he had experienced in the English Channel.

Other attempts at producing dreams experimentally have been [26]
reported by Hervey de Saint-Denys [1867, 268 f. and 376 f.], Weygandt (1893) and others.

Many writers have commented upon 'the striking facility with which dreams are able to weave a sudden impression from the world of the senses into their own structure so that it comes as what appears to be a prearranged catastrophe that has been gradually led up to.' (Hildebrandt, 1875, [36].) 'In my youth', this author goes on, 'I used to make use of an alarm-clock in order to be up regularly at a fixed hour. It must have happened hundreds of times that the noise produced by

1 The '*chauffeurs*' [heaters] were bands of robbers in La Vendée [at the time of the French Revolution], who made use of the method of torture described above.

this instrument fitted into an ostensibly lengthy and connected dream as though the whole dream had been leading up to that one event and had reached its appointed end in what was a logically indispensable climax.' [Ibid., 37.]

I shall quote three of these alarm-clock dreams presently in another connection. [p. 25 f. below.]

Volkelt (1875, 108 f.) writes: 'A composer once dreamt that he was giving a class and was trying to make a point clear to his pupils. When he had done, he turned to one of the boys and asked him if he had followed. The boy shouted back like a lunatic: "Oh ja! [Oh yes!]" He began to reprove the boy angrily for shouting, but the whole class broke out into cries first of "Orja!", then of "Eurjo!" and finally of "Feuerjo!"[1] At this point he was woken up by actual cries of "Feuerjo!" in the street.'

Garnier (1872, [**1**, 476]), quoted by Radestock (1879), tells how Napoleon I was woken by the explosion of an infernal machine while he was asleep in his carriage. He had a dream that he was once more crossing the Tagliamento under the Austrian bombardment, and at last started up with a cry: 'We are undermined!'[2]

A dream dreamt by Maury (1878, 161) has become famous. He was ill and lying in his room in bed, with his mother sitting beside him, and dreamt that it was during the Reign of Terror. After witnessing a number of frightful scenes of murder, he was finally himself brought before the revolutionary tribunal. There he saw Robespierre, Marat, Fouquier-Tinville and the rest of the grim heroes of those terrible days. He was
[27] questioned by them, and, after a number of incidents which were not retained in his memory, was condemned, and led to the place of execution surrounded by an immense mob. He climbed on to the scaffold and was bound to the plank by the executioner. It was tipped up. The blade of the guillotine fell. He felt his head being separated from his body, woke up in extreme anxiety – and found that the top of the bed had fallen down and had struck his cervical vertebrae just in the way in which the blade of the guillotine would actually have struck them.

This dream was the basis of an interesting discussion between Le Lorrain (1894) and Egger (1895) in the *Revue philosophique*. The question raised was whether and how it was possible for a dreamer to compress such an apparently superabundant quantity of material into the short period elapsing between his perceiving the rousing stimulus and his waking.[3]

1 [The first two of these last three exclamations are meaningless; the third is the conventional cry for an alarm of fire.]

2 [Further considered below on pp. 207 f. and 445.]

3 [Further discussed below, pp. 57 and 443 ff.]

Examples of this kind leave an impression that of all the sources of dreams the best confirmed are objective sensory stimuli during sleep. Moreover they are the only sources whatever taken into account by laymen. If an educated man, who is unacquainted with the literature of dreams, is asked how dreams arise, he will infallibly answer with a reference to some instance he has come across in which a dream was explained by an objective sensory stimulus discovered after waking. Scientific enquiry, however, cannot stop there. It finds an occasion for further questions in the observed fact that the stimulus which impinges on the senses during sleep does not appear in the dream in its *real* shape but is replaced with another image in some way related to it. But the relation connecting the stimulus of the dream to the dream which is its result is, to quote Maury's words (1853, 72), 'une affinité quelconque, mais qui n'est pas unique et exclusive'.[1] Let us consider in this connection three of Hildebrandt's alarm-clock dreams (1875, 37 f.). The question they raise is why the same stimulus should have provoked three such different dreams and why it should have provoked these rather than any other.

'I dreamt, then, that one spring morning I was going for a walk and was strolling through the green fields till I came to a neighbouring village, where I saw the villagers in their best clothes, with hymn books [28] under their arms, flocking to the church. Of course! It was Sunday, and early morning service would soon be beginning. I decided I would attend it; but first, as I was rather hot from walking, I went into the churchyard which surrounded the church, to cool down. While I was reading some of the tombstones, I heard the bell-ringer climbing up the church tower and at the top of it I now saw the little village bell which would presently give the signal for the beginning of devotions. For quite a while it hung there motionless, then it began to swing, and suddenly its peal began to ring out clear and piercing – so clear and piercing that it put an end to my sleep. But what was ringing was the alarm-clock.

'Here is another instance. It was a bright winter's day and the streets were covered with deep snow. I had agreed to join a party for a sleigh ride; but I had to wait a long time before news came that the sleigh was at the door. Now followed the preparations for getting in – the fur rug spread out, the foot-muff put ready – and at last I was sitting in my seat. But even then the moment of departure was delayed till a pull at the reins gave the waiting horses the signal. Then off they started, and, with a violent shake, the sleigh bells broke into their familiar jingle – with

1 ['An affinity of some kind, but one which is not unique and exclusive.']

such violence, in fact, that in a moment the cobweb of my dream was torn through. And once again it was only the shrill sound of the alarm-clock.

'And now yet a third example. I saw a kitchen-maid, carrying several dozen plates piled on one another, walking along the passage to the dining room. The column of china in her arms seemed to me in danger of losing its balance. "Take care," I exclaimed, "or you'll drop the whole load." The inevitable rejoinder duly followed: she was quite accustomed to that kind of job, and so on. And meanwhile my anxious looks followed the advancing figure. Then – just as I expected – she stumbled at the threshold and the fragile crockery slipped and rattled and clattered in a hundred pieces on the floor. But the noise continued without ceasing, and soon it seemed no longer to be a clattering; it was turning into a ringing – and the ringing, as my waking self now became aware, was only the alarm-clock doing its duty.'

The question of why the mind mistakes the nature of objective sensory stimuli in dreams receives almost the same answer from Strümpell (1877, [103]) as from Wundt (1874, [659 f.]): the mind receives stimuli [29] that reach it during sleep under conditions favourable to the formation of illusions. A sense impression is recognized by us and *correctly interpreted* – that is, it is placed in the group of memories to which, in accordance with all our previous experiences, it belongs – provided the impression is sufficiently strong, clear and lasting and provided we have sufficient time at our disposal for considering the matter. If these conditions are not fulfilled, we mistake the object which is the source of the impression: we form an illusion about it. 'If someone goes for a walk in the open country and has an indeterminate perception of a distant object, he may at first believe it to be a horse.' On a closer view he may be led to interpret it as a cow lying down, and the image may finally resolve itself definitely into a group of people sitting on the ground. The impressions received by the mind from external stimuli during sleep are of a similarly indeterminate nature; and on their basis the mind forms illusions, since a greater or smaller number of mnemic images are aroused by the impression and it is through them that it acquires its psychical value. From *which* of the many groups of memories concerned the related images shall be aroused and *which* of the possible associative connections shall accordingly be put into action – these questions too, on Strümpell's theory, are indeterminable and are, as it were, left open to the arbitrary decision of the mind.

At this point we are faced with a choice between two alternatives. We may admit it as a fact that it is impossible to follow the laws governing the formation of dreams any further; and we may accordingly refrain from enquiring whether there may not be other determinants governing the interpretation put by the dreamer upon the illusion called up by the sense impression. Or, on the other hand, we may have a suspicion that the sensory stimulus which impinges on the sleeper plays only a modest part in generating his dream and that other factors determine the choice of the mnemic images which are to be aroused in him. In fact, if we examine Maury's experimentally produced dreams (which I have related in such detail for this very reason), we shall be tempted to say that the experiment in fact accounts for the origin of only one element of the dreams; the rest of their content seems too self-contained, too definite in its details, to be explicable solely by the necessity for fitting in with the element experi- [30]
mentally introduced from outside. Indeed, one begins to have doubts about the illusion theory and about the power of objective impressions to give a shape to dreams when one finds that those impressions are sometimes subjected in dreams to the most peculiar and far-fetched interpretations. Thus Simon (1888) tells us of a dream in which he saw some gigantic figures seated at table and clearly heard the frightful snapping noise made by their jaws coming together as they chewed. When he awoke he heard the beat of a horse's hooves galloping past his window. The noise made by the horse's hooves may have suggested ideas from a group of memories connected with *Gulliver's Travels* – the giants of Brobdingnag and the virtuous Houyhnhnms – if I may venture on an interpretation without the dreamer's assistance. Is it not probable, then, that the choice of such an unusual group of memories as these was facilitated by motives other than the objective stimulus alone?[1]

2. *Internal (Subjective) Sensory Excitations*

In spite of any objections to the contrary, it has to be admitted that the part played by objective sensory excitations during sleep in provoking dreams remains indisputable. And if such stimuli may appear, from their nature and frequency, insufficient to explain *every* dream image, we shall be encouraged to seek other sources of dreams analogous to them in their operation. I cannot say when the idea first cropped up of taking

1 [*Footnote added* 1911:] The appearance of gigantic figures in a dream gives grounds for supposing that some scene from the dreamer's childhood is involved. [Cf. p. 364 f. below.] – [*Added* 1925:] Incidentally, the interpretation given in the text, pointing to a reminiscence of *Gulliver's Travels*, is a good example of what an interpretation ought *not* to be. The interpreter of a dream should not give free play to his own ingenuity and neglect the dreamer's associations.

internal (subjective) excitations of the sense organs into account alongside of the *external* sensory stimuli. It is, however, the case that this is done, more or less explicitly, in all the more recent discussions of the aetiology of dreams. 'An essential part is also played, I believe,' writes Wundt (1874, 657), 'in the production of the illusions that occur in dreams by the subjective visual and auditory sensations which are familiar to us in the waking state as the formless areas of luminosity which become visible to us when our field of vision is darkened, as ringing or
[31] buzzing in the ears, and so on. Especially important among these are the subjective excitations of the retina. It is in this way that is to be explained the remarkable tendency of dreams to conjure up before the eyes similar or identical objects in large numbers. We see before us innumerable birds or butterflies or fishes or coloured beads or flowers, etc. Here the luminous dust in the darkened field of vision has taken on a fantastic shape, and the numerous specks of which it consists are incorporated into the dream as an equal number of separate images; and these, on account of their mobility, are regarded as *moving* objects. – This is no doubt also the basis of the great fondness shown by dreams for animal figures of every sort; for the immense variety of such forms can adjust itself easily to the particular form assumed by the subjective luminous images.'

As sources of dream images, subjective sensory excitations have the obvious advantage of not being dependent, like objective ones, upon external chance. They are ready to hand, as one might say, whenever they are needed as an explanation. But they are at a disadvantage compared with objective sensory stimuli in that the part they play in instigating a dream is scarcely or not at all open to confirmation, as is the case with objective stimuli, by observation and experiment. The chief evidence in favour of the power of subjective sensory excitations to instigate dreams is provided by what are known as 'hypnagogic hallucinations', or, to use Johannes Müller's term (1826), 'imaginative visual phenomena'. These are images, often very vivid and rapidly changing, which are apt to appear – quite habitually in some people – during the period of falling asleep; and they may also persist for a time after the eyes have been opened. Maury, who was subject to them in a high degree, has made an exhaustive examination of them and maintains (as did Müller [ibid., 49 f.] before him) their connection and indeed their identity with dream images. In order to produce them, he says (Maury, 1878, 59 f.), a certain amount of mental passivity, a relaxation of the strain of attention, is necessary. It is enough, however, to fall into a

lethargic state of this kind for no more than a second (provided that one has the necessary predisposition) in order to have a hypnagogic hallucination. After this one may perhaps wake up again and the process may be repeated several times until one finally falls asleep. Maury found that if he then woke up once more after not too long an interval, he was able [32] to detect in his dream the same images that had floated before his eyes as hypnagogic hallucinations before he fell asleep. (Ibid., 134 f.) This was the case on one occasion with a number of grotesque figures with distorted faces and strange *coiffures* which pestered him with extreme pertinacity while he was going to sleep and which he remembered having dreamt about after he woke. Another time, when he was suffering from hunger owing to having put himself on a light diet, he had a hypnagogic vision of a plate and a hand armed with a fork which was helping itself to some of the food from the plate. In the dream which followed he was sitting at a well-spread table and heard the noise made by the diners with their forks. Yet another time, when he went to sleep with his eyes in an irritated and painful state, he had a hypnagogic hallucination of some microscopically small signs which he could only decipher one by one with the greatest difficulty; he was woken from his sleep an hour later and remembered a dream in which there was an open book printed in very small type which he was reading painfully.

Auditory hallucinations of words, names, and so on can also occur hypnagogically in the same way as visual images, and may then be repeated in a dream – just as an overture announces the principal themes which are to be heard in the opera that is to follow.

A more recent observer of hypnagogic hallucinations, G. Trumbull Ladd (1892), has followed the same lines as Müller and Maury. After some practice he succeeded in being able to wake himself suddenly without opening his eyes, from two to five minutes after gradually falling asleep. He thus had an opportunity of comparing the retinal sensations which were just disappearing with the dream images persisting in his memory. He declares that it was possible in every case to recognize an internal relation between the two, for the luminous points and lines of the idioretinal light provided, as it were, an outline drawing or diagram of the figures mentally perceived in the dream. For instance, an arrangement of the luminous points in the retina in parallel lines corresponded to a dream in which he had been seeing, clearly spread out in front of him, some lines of print which he was engaged in reading. Or, to use his own words, 'the clearly printed page which I was reading in my dream faded away into an object that

[33] appeared to my waking consciousness like a section of an actual page of print when seen through an oval hole in a piece of paper at too great a distance to distinguish more than an occasional fragment of a word, and even that dimly'. Ladd is of the opinion (though he does not underestimate the part played in the phenomenon by central [cerebral] factors) that scarcely a single visual dream occurs without the participation of material provided by intra-ocular retinal excitation. This applies especially to dreams occurring soon after falling asleep in a dark room, while the source of stimulus for dreams occurring in the morning shortly before waking is the objective light which penetrates the eyes in a room that is growing light. The changing, perpetually shifting character of the excitation of the idioretinal light corresponds precisely to the constantly moving succession of images shown us by our dreams. No-one who attaches importance to these observations of Ladd's will underestimate the part played in dreams by these subjective sources of stimulation, for, as we know, visual images constitute the principal component of our dreams. The contributions from the other senses, except for that of hearing, are intermittent and of less importance.

3. *Internal Organic Somatic Stimuli*

Since we are now engaged in looking for sources of dreams inside the organism instead of outside it, we must bear in mind that almost all our internal organs, though they give us scarcely any news of their working so long as they are in a healthy state, become a source of what are mainly distressing sensations when they are in what we describe as states of excitation, or during illnesses. These sensations must be equated with the sensory or painful stimuli reaching us from the outside. The experience of ages is reflected in – to take an example – Strümpell's remarks on the subject (1877, 107): 'During sleep the mind attains a far deeper and wider sensory consciousness of somatic events than during the waking state. It is obliged to receive and be affected by impressions of stimuli from parts of the body and from changes in the body of which it knows nothing when awake.' So early a writer as Aristotle regarded it as quite possible that the beginnings of an illness might make themselves felt in dreams before anything could be noticed of it in waking life, owing to the magnifying effect produced upon impressions by dreams. (See above, p. 3.) Medical writers, too,
[34] who were certainly far from believing in the prophetic power of dreams,

have not disputed their significance as premonitors of illness. (Cf. Simon, 1888, 31, and many earlier writers.[1])

Instances of the diagnostic power of dreams seem to be vouched for in more recent times. Thus Tissié (1898, 62 f.) quotes from Artigues (1884, 43) the story of a forty-three-year-old woman, who, while apparently in perfect health, was for some years tormented by anxiety dreams. She was then medically examined and found to be in the early stages of an affection of the heart, to which she eventually succumbed.

Pronounced disorders of the internal organs obviously act as instigators of dreams in a whole number of cases. The frequency of anxiety dreams in diseases of the heart and lungs is generally recognized. Indeed, this side of dream life is placed in the foreground by so many authorities that I am content with a mere reference to the literature: Radestock [1879, 70], Spitta [1882, 241 f.], Maury [1878, 33 f.], Simon (1888), Tissié [1898, 60 ff.]. Tissié is even of the opinion that the particular organ affected gives a characteristic impress to the content of the dream. Thus the dreams of those suffering from diseases of the heart are usually short and come to a terrifying end at the moment of waking; their content almost always includes a situation involving a horrible death. Sufferers from diseases of the lungs dream of suffocation, crowding and fleeing, and are remarkably subject to the familiar nightmare. (It may be remarked, incidentally, that Börner (1855) has succeeded in provoking the latter experimentally by lying on his face or covering the respiratory apertures.) In the case of digestive disor- [35]
ders dreams contain ideas connected with enjoyment of food or disgust. Finally, the influence of sexual excitement on the content of dreams can be adequately appreciated by everyone from his own experience and provides the theory that dreams are instigated by organic stimuli with its most powerful support.

No-one, moreover, who goes through the literature of the subject can fail to notice that some writers, such as Maury [1878, 451 f.] and

1 [*Footnote added* 1914:] Apart from the diagnostic value ascribed to dreams (e.g. in the works of Hippocrates [see above, p. 3 *n.* 2]), their *therapeutic* importance in antiquity must also be borne in mind. In Greece there were dream oracles, which were regularly visited by patients in search of recovery. A sick man would enter the temple of Apollo or Aesculapius, would perform various ceremonies there, would be purified by lustration, massage and incense, and then, in a state of exaltation, would be stretched on the skin of a ram that had been sacrificed. He would then fall asleep and would dream of the remedies for his illness. These would be revealed to him either in their natural form or in symbols and pictures which would afterwards be interpreted by the priests. For further information upon therapeutic dreams among the Greeks see Lehmann (1908, **1**, 74), Bouché-Leclercq (1879–82), Hermann (1858, §41, 262 ff., and 1882, §38, 356), Böttinger (1795, 163 ff.), Lloyd (1877), Döllinger (1857, 130). – [A comment on the 'diagnostic' value of dreams can be found near the beginning of Freud (1916–17*f* [1915]), *RSE*, **14**, 197 ff.]

Weygandt (1893), were led to the study of dream problems by the effect of their own illnesses upon the content of their dreams.

Nevertheless, though these facts are established beyond a doubt, their importance for the study of the sources of dreams is not so great as might have been hoped. Dreams are phenomena which occur in healthy people – perhaps in everyone, perhaps every night – and it is obvious that organic illness cannot be counted among its indispensable conditions. And what we are concerned with is not the origin of certain special dreams but the source that instigates the ordinary dreams of normal people.

We need only go a step further, however, in order to come upon a source of dreams more copious than any we have so far considered, one indeed which seems as though it could never run dry. If it is established that the interior of the body when it is in a diseased state becomes a source of stimuli for dreams, and if we admit that during sleep the mind, being diverted from the external world, is able to pay more attention to the interior of the body, then it seems plausible to suppose that the internal organs do not need to be diseased before they can cause excitations to reach the sleeping mind – excitations which are somehow turned into dream images. While we are awake we are aware of a diffuse general sensibility or coenaesthesia, but only as a vague quality of our mood; to this feeling, according to medical opinion, all the organic systems contribute a share. At night, however, it would seem that this same feeling, grown into a powerful influence and acting through its various components, becomes the strongest and at the same time the commonest source for instigating dream images. If this is so, it would only remain to investigate the laws according to which the organic stimuli turn into dream images.

We have here reached the theory of the origin of dreams which is
[36] preferred by all the medical authorities. The obscurity in which the centre of our being (the '*moi splanchnique*', as Tissié [1898, 23] calls it) is veiled from our knowledge and the obscurity surrounding the origin of dreams tally too well not to be brought into relation to each other. The line of thought which regards vegetative organic sensation as the constructor of dreams has, moreover, a particular attraction for medical men since it allows of a single aetiology for dreams and mental diseases, whose manifestations have so much in common; for coenaesthetic changes and stimuli arising from the internal organs are also held largely responsible for the origin of the psychoses. It is not surprising, therefore, that the origin of the

theory of somatic stimulation may be traced back to more than one independent source.

The line of argument developed by the philosopher Schopenhauer in 1851 has had a decisive influence on a number of writers. Our picture of the universe, in his view, is arrived at by our intellect taking the impressions that impinge on it from outside and remoulding them into the forms of time, space and causality. During the daytime the stimuli from the interior of the organism, from the sympathetic nervous system, exercise at the most an unconscious effect upon our mood. But at night, when we are no longer deafened by the impressions of the day, those which arise from within are able to attract attention – just as at night we can hear the murmuring of a brook which is drowned by daytime noises. But how is the intellect to react to these stimuli otherwise than by carrying out its own peculiar function on them? The stimuli are accordingly remodelled into forms occupying space and time and obeying the rules of causality, and thus dreams arise [cf. Schopenhauer, 1862, **1**, 249 ff.]. Scherner (1861) and after him Volkelt (1875) endeavoured subsequently to investigate in more detail the relation between somatic stimuli and dream images, but I shall postpone my consideration of these attempts till we reach the section dealing with the various theories about dreams. [See below, p. 73 ff.]

Krauss [1859, 255], the psychiatrist, in an investigation carried through with remarkable consistency, traces the origin alike of dreams and of deliria[1] and delusions [*Wahnideen*] to the same factor, namely to organically determined sensations. It is scarcely possible to think of any part of the organism which might not be the starting point of a dream or of [37]
a delusion. Organically determined sensations 'may be divided into two classes: (1) those constituting the general mood (coenaesthesia) and (2) the specific sensations immanent in the principal systems of the vegetative organism. Of these latter five groups are to be distinguished: (*a*) muscular, (*b*) respiratory, (*c*) gastric, (*d*) sexual and (*e*) peripheral sensations.' Krauss supposes that the process by which dream images arise on the basis of somatic stimuli is as follows. The sensation that has been aroused evokes a cognate image, in accordance with some law of association. It combines with the image into an organic structure, to which, however, consciousness reacts abnormally. For it pays no attention to the *sensation*, but directs the whole of it to the accompanying *images* – which explains why the true facts were for so long

1 [Perhaps 'hallucinations'; see p. 52 *n.* below.]

misunderstood. Krauss has a special term for describing this process: the 'trans-substantiation' of sensations into dream images.

The influence of organic somatic stimuli upon the formation of dreams is almost universally accepted today; but the question of the laws that govern the relation between them is answered in very various ways, and often by obscure pronouncements. On the basis of the theory of somatic stimulation, dream interpretation is thus faced with the special problem of tracing back the content of a dream to the organic stimuli which caused it; and, if the rules for interpretation laid down by Scherner (1861) are not accepted, one is often faced with the awkward fact that the only thing that reveals the existence of the organic stimulus is precisely the content of the dream itself.

There is a fair amount of agreement, however, over the interpretation of various forms of dreams that are described as 'typical', because they occur in large numbers of people and with very similar content. Such are the familiar dreams of falling from a height, of teeth falling out, of flying and of embarrassment at being naked or insufficiently clad. This last dream is attributed simply to the sleeper's perceiving that he has thrown off his bedclothes in his sleep and is lying exposed to the air. The dream of teeth falling out is traced back to a 'dental stimulus', though this does not necessarily imply that the excitation of the teeth is a pathological one. According to Strümpell [1877, 119] the flying dream is the image which is found appropriate by the mind as an interpretation of the stimulus produced by the rising and sinking of
[38] the lobes of the lungs at times when cutaneous sensations in the thorax have ceased to be conscious: it is this latter circumstance that leads to the feeling which is attached to the idea of floating. The dream of falling from a height is said to be due to an arm falling away from the body or a flexed knee being suddenly extended at a time when the sense of cutaneous pressure is beginning to be no longer conscious; the movements in question cause the tactile sensations to become conscious once more, and the transition to consciousness is represented psychically by the dream of falling (ibid., 118). The obvious weakness of these attempted explanations, plausible though they are, lies in the fact that, without any other evidence, they can make successive hypotheses that this or that group of organic sensations enters or disappears from mental perception, till a constellation has been reached which affords an explanation of the dream. I shall later have occasion to return to the question of typical dreams and their origin. [Cf. pp. 214 ff. and 344 ff. below.]

Simon (1888, 34 f.) has attempted to deduce some of the rules governing the way in which organic stimuli determine the resultant dreams by comparing a series of similar dreams. He asserts that if an organic apparatus which normally plays a part in the expression of an emotion is brought by some extraneous cause during sleep into the state of excitation which is usually produced by the emotion, then a dream will arise which will contain images appropriate to the emotion in question. Another rule lays it down that if during sleep an organ is in a state of activity, excitation or disturbance, the dream will produce images related to the performance of the function which is discharged by the organ concerned.

Mourly Vold (1896) has set out to prove experimentally in one particular field the effect on the production of dreams which is asserted by the theory of somatic stimulation. His experiments consisted in altering the position of a sleeper's limbs and comparing the resultant dreams with the alterations made. He states his findings as follows:

(1) The position of a limb in the dream corresponds approximately to its position in reality. Thus, we dream of the limb being in a static condition when it is so actually.

(2) If we dream of a limb moving, then one of the positions passed through in the course of completing the movement invariably corresponds to the limb's actual position.

(3) The position of the dreamer's own limb may be ascribed in the dream to some other person. [39]

(4) The dream may be of the movement in question being *hindered*.

(5) The limb which is in the position in question may appear in the dream as an animal or monster, in which case a certain analogy is established between them.

(6) The position of a limb may give rise in the dream to thoughts which have some connection with the limb. Thus, if the fingers are concerned, we dream of numbers.

I should be inclined to conclude from findings such as these that even the theory of somatic stimulation has not succeeded in completely doing away with the apparent absence of determination in the choice of what dream images are to be produced.[1]

1 [*Footnote added* 1914:] This author has since produced a two-volume report on his experiments (1910 and 1912), which is referred to below. [See p. 198 *n.*]

4. *Psychical Sources of Stimulation*

When we were dealing with the relations of dreams to waking life and with the material of dreams, we found that the most ancient and the most recent students of dreams were united in believing that men dream of what they do during the daytime and of what interests them while they are awake [p. 6 f. above]. Such an interest, carried over from waking life into sleep, would not only be a mental bond, a link between dreams and life, but would also provide us with a further source of dreams and one not to be despised. Indeed, taken in conjunction with the interests that develop during sleep – the stimuli that impinge on the sleeper – it might be enough to explain the origin of all dream images. But we have also heard the opposite asserted, namely that dreams withdraw the sleeper from the interests of daytime and that, as a rule, we only start dreaming of the things that have most struck us during the day, after they have lost the spice of actuality in waking life. [pp. 6 and 16.] Thus at every step we take in our analysis of dream life we come to feel that it is impossible to make generalizations without covering ourselves by such qualifying phrases as 'frequently', 'as a rule' or 'in most cases', and without being prepared to admit the validity of exceptions.

[40] If it were a fact that waking interests, along with internal and external stimuli during sleep, sufficed to exhaust the aetiology of dreams, we ought to be in a position to give a satisfactory account of the origin of every element of a dream: the riddle of the sources of dreams would be solved, and it would only remain to define the share taken respectively by psychical and somatic stimuli in any particular dream. Actually no such complete explanation of a dream has ever yet been achieved, and anyone who has attempted it has found portions (and usually very numerous portions) of the dream regarding whose origin he could find nothing to say. Daytime interests are clearly not such far-reaching psychical sources of dreams as might have been expected from the categorical assertions that everyone continues to carry on his daily business in his dreams.

No other psychical sources of dreams are known. So it comes about that all the explanations of dreams given in the literature of the subject – with the possible exception of Scherner's, which will be dealt with later [see p. 73 f. below] – leave a great gap when it comes to assigning an origin for the ideational images [*Vorstellungsbildern*] which constitute the most characteristic material of dreams. In this embarrassing situation, a majority of the writers on the subject have tended to

reduce to a minimum the part played by psychical factors in instigating dreams, since those factors are so hard to come at. It is true that they divide dreams into two main classes – those 'due to nervous stimulation' and those 'due to association', of which the latter have their source exclusively in reproduction [of material already experienced] (cf. Wundt, 1874, 657 f.). Nevertheless, they cannot escape a doubt 'whether any dream can take place without being given an impetus by some somatic stimulus' (Volkelt, 1875, 127). It is difficult even to give a description of purely associative dreams. 'In associative dreams proper, there can be no question of any such solid core [derived from somatic stimulation]. Even the very centre of the dream is only loosely put together. The ideational processes, which in any dream are ungoverned by reason or common sense, are here no longer even held together by any relatively important somatic or mental excitations, and are thus abandoned to their own kaleidoscopic changes and to their own jumbled confusion.' (Ibid., 118.) Wundt (1874, 656–7), too, seeks to minimize the psychical factor in the instigation of dreams. He declares that there seems to be no justification for regarding the phantasms of dreams as pure hallucinations; most dream images are probably in fact illusions, since they arise from faint sense impressions, which never cease during sleep. Weygandt (1893, 17) has adopted this same view and made its application general. He asserts of *all* dream images 'that their primary causes are sensory stimuli and that only later do reproductive associations become attached to them'. Tissié (1898, 183) goes even further in putting a limit to the psychical sources of stimulation: 'Les rêves d'origine absolument psychique n'existent pas'; and (ibid., 6) 'les pensées de nos rêves nous viennent du dehors. . . .'[1] [41]

Those writers who, like that eminent philosopher Wundt, take up a middle position do not fail to remark that in most dreams somatic stimuli and the psychical instigators (whether unknown or recognized as daytime interests) work in cooperation.

We shall find later that the enigma of the formation of dreams can be solved by the revelation of an unsuspected psychical source of stimulation. Meanwhile we shall feel no surprise at the overestimation of the part played in forming dreams by stimuli which do not arise from mental life. Not only are they easy to discover and even open to experimental confirmation; but the somatic view of the origin of dreams is completely in line with the prevailing trend of thought in psychiatry today. It is true

1 ['Dreams of purely psychical origin do not exist.' 'The thoughts in our dreams reach us from outside.']

that the dominance of the brain over the organism is asserted with apparent confidence. Nevertheless, anything that might indicate that mental life is in any way independent of demonstrable organic changes or that its manifestations are in any way spontaneous alarms the modern psychiatrist, as though a recognition of such things would inevitably bring back the days of the Philosophy of Nature [see p. 4 *n.* 2 above], and of the metaphysical view of the nature of mind. The suspicions of the psychiatrists have put the mind, as it were, under tutelage, and they now insist that none of its impulses [*Regungen*][T] shall be allowed to suggest that it has any means of its own. This behaviour of theirs only shows how little trust they really have in the validity of a causal connection between the somatic and the mental. Even when investigation shows that the primary exciting cause of a phenomenon is psychical,
[42] deeper research will one day trace the path further and discover an organic basis for the mental event. But if at the moment we cannot see beyond the mental, that is no reason for denying its existence.[1]

1 [The topics in this section are taken up again in Section C of Chapter V (p. 195 ff. below).]

(D)
WHY DREAMS ARE FORGOTTEN AFTER WAKING

It is a proverbial fact that dreams melt away in the morning. They can, [43]
of course, be remembered; for we only know dreams from our memory of them after we are awake. But we very often have a feeling that we have only remembered a dream in part and that there was more of it during the night; we can observe, too, how the recollection of a dream, which was still lively in the morning, will melt away, except for a few small fragments, in the course of the day; we often know we have dreamt, without knowing *what* we have dreamt; and we are so familiar with the fact of dreams being liable to be forgotten [*Vergessen*] that we see no absurdity in the possibility of someone having had a dream in the night and of his not being aware in the morning either of what he has dreamt or even of the fact that he has dreamt at all. On the other hand, it sometimes happens that dreams show an extraordinary persistence in the memory. I have analysed dreams in my patients which occurred twenty-five and more years earlier; and I can remember a dream of my own separated by at least thirty-seven years from today and yet as fresh as ever in my memory. All of this is very remarkable and not immediately intelligible.

The most detailed account of the forgetting of dreams is the one given by Strümpell [1877, 79 f.]. It is evidently a complex phenomenon, for Strümpell traces it back not to a single cause but to a whole number of them.

In the first place, all the causes that lead to forgetting in waking life are operative for dreams as well. When we are awake we regularly forget countless sensations and perceptions at once, because they were too weak or because the mental excitation attaching to them was too slight. The same holds good of many dream images: they are forgotten because they are too weak, while stronger images adjacent to them are remembered. The factor of intensity, however, is certainly not in itself enough to determine whether a dream image shall be recollected. Strümpell [1877, 82] admits, as well as other writers (e.g. Calkins, 1893, 312), that we often forget dream images which we know were very [44]
vivid, while a very large number which are shadowy and lacking in sensory force are among those retained in the memory. Moreover, when

we are awake we tend easily to forget an event which occurs only once and more readily to notice what can be perceived repeatedly. Now most dream images are unique experiences;[1] and that fact will contribute impartially towards making us forget all dreams. Far more importance attaches to a third cause of forgetting. If sensations, ideas, thoughts, and so on, are to attain a certain degree of susceptibility to being remembered, it is essential that they should not remain isolated but should be arranged in appropriate concatenations and groupings. If a short line of verse is divided up into its component words and these are mixed up, it becomes very hard to remember. 'If words are properly arranged and put into the relevant order, one word will help another, and the whole, being charged with meaning, will be easily taken up by the memory and retained for a long time. It is in general as difficult and unusual to retain what is nonsensical as it is to retain what is confused and disordered.' [Strümpell, 1877, 83.] Now dreams are in most cases lacking in intelligibility and orderliness. The compositions which constitute dreams are barren of the qualities which would make it possible to remember them, and they are forgotten because as a rule they fall to pieces a moment later. Radestock (1879, 168), however, claims to have observed that it is the most peculiar dreams that are best remembered, and this, it must be admitted, would scarcely tally with what has just been said.

Strümpell [1877, 82 f.] believes that certain other factors derived from the relation between dreaming and waking life are of still greater importance in causing dreams to be forgotten. The liability of dreams to be forgotten by waking consciousness is evidently only the counterpart of the fact which has been mentioned earlier [p. 18 f. above] that dreams scarcely ever take over ordered recollections from waking life, but only details selected from them, which they tear from the psychical context in which they are usually remembered in the waking state. Thus dream compositions find no place in the company of the psychical sequences with which the mind is filled. There is nothing that can help us to
[45] remember them. 'In this way dream structures are, as it were, lifted above the floor of our mental life and float in psychical space like clouds in the sky, scattered by the first breath of wind.' (Strümpell, 1877, 87.) After waking, moreover, the world of the senses presses forward and at once takes possession of the attention with a force which very few dream images can resist; so that here too we have another factor tending

1 Dreams that recur periodically have often been observed. Cf. the collection given by Chabaneix (1897). [Cf. p. 168 below.]

in the same direction. Dreams give way before the impressions of a new day just as the brilliance of the stars yields to the light of the sun.

Finally, there is another fact to be borne in mind as likely to lead to dreams being forgotten, namely that most people take very little interest in their dreams. Anyone, such as a scientific investigator, who pays attention to his dreams over a period of time will have more dreams than usual – which no doubt means that he remembers his dreams with greater ease and frequency.

Two further reasons why dreams should be forgotten, which Benini [1898, 155–6] quotes as having been brought forward by Bonatelli [1880] as additions to those mentioned by Strümpell, seem, in fact, to be already covered by the latter. They are (1) that the alteration in coenaesthesia between the sleeping and waking states is unfavourable to reciprocal reproduction between them; and (2) that the different arrangement of the ideational material in dreams makes them untranslatable, as it were, for waking consciousness.

In view of all these reasons in favour of dreams being forgotten, it is in fact (as Strümpell himself insists [1877, 6]) very remarkable that so many of them are retained in the memory. The repeated attempts by writers on the subject to lay down the rules governing the recollection of dreams amount to an admission that here too we are faced with something puzzling and unexplained. Certain particular characteristics of the recollection of dreams have been rightly emphasized recently (cf. Radestock, 1879, [169], and Tissié, 1898, [148 f.]), such as the fact that when a dream seems in the morning to have been forgotten, it may nevertheless be recollected during the course of the day, if its content, forgotten though it is, is touched upon by some chance perception.

But the recollection of dreams in general is open to an objection which is bound to reduce their value very completely in critical opinion. Since so great a proportion of dreams is lost altogether, we may well doubt [46] whether our memory of what is left of them may not be falsified.

These doubts as to the accuracy of the reproduction of dreams are also expressed by Strümpell (1877, [119]): 'Thus it may easily happen that waking consciousness unwittingly makes interpolations in the memory of a dream: we persuade ourselves that we have dreamt all kinds of things that were not contained in the actual dreams.'

Jessen (1855, 547) writes with special emphasis on this point: 'Moreover, in investigating and interpreting coherent and consistent dreams a particular circumstance must be borne in mind which, as it seems to me, has hitherto received too little attention. In such cases the truth is

almost always obscured by the fact that when we recall dreams of this kind to our memory we almost always – unintentionally and without noticing the fact – fill in the gaps in the dream images. It is seldom or never that a coherent dream was in fact as coherent as it seems to us in memory. Even the most truth-loving of men is scarcely able to relate a noteworthy dream without some additions or embellishments. The tendency of the human mind to see everything connectedly is so strong that in memory it unwittingly fills in any lack of coherence there may be in an incoherent dream.'

Some remarks made by Egger [1898], though they were no doubt arrived at independently, read almost like a translation of this passage from Jessen: '. . . L'observation des rêves a ses difficultés spéciales et le seul moyen d'éviter tout erreur en pareille matière est de confier au papier sans le moindre retard ce que l'on vient d'éprouver et de remarquer; sinon, l'oubli vient vite ou total ou partiel; l'oubli total est sans gravité; mais l'oubli partiel est perfide; car si l'on se met ensuite à raconter ce que l'on n'a pas oublié, on est exposé à compléter par imagination les fragments incohérents et disjoints fournis par la mémoire . . .; on devient artiste à son insu, et le récit périodiquement répété s'impose à la créance de son auteur, qui, de bonne foi, le présente comme un fait authentique, dûment établi selon les bonnes méthodes. . . .'[1]

[47] Very similar ideas are expressed by Spitta (1882, 338), who seems to believe that it is not until we try to reproduce a dream that we introduce order of any kind into its loosely associated elements: we 'change things that are merely *juxtaposed* into *sequences or causal chains*, that is to say, we introduce a process of logical connection which is lacking in the dream.'

Since the only check that we have upon the validity of our memory is objective confirmation, and since that is unobtainable for dreams, which are our own personal experience and of which the only source we have is our recollection, what value can we still attach to our memory of dreams?[2]

1 ['There are peculiar difficulties in observing dreams, and the only way of escaping all errors in such matters is to put down upon paper with the least possible delay what we have just experienced or observed. Otherwise forgetfulness, whether total or partial, quickly supervenes. Total forgetfulness is not serious; but partial forgetfulness is treacherous. For if we then proceed to give an account of what we have not forgotten, we are liable to fill in from our imagination the incoherent and disjointed fragments furnished by memory. . . . We unwittingly become creative artists; and the tale, if it is repeated from time to time, imposes itself on its author's own belief, and he ends by offering it in good faith as an authentic fact duly and legitimately established.']

2 [The questions raised in this section are taken up in Chapter VII, Section A (p. 458 ff. below).]

(E)
THE DISTINGUISHING PSYCHOLOGICAL CHARACTERISTICS OF DREAMS

Our scientific consideration of dreams starts off from the assumption [48]
that they are products of our own mental activity. Nevertheless, the finished dream strikes us as something alien to us. We are so little obliged to acknowledge our responsibility for it that [in German] we are just as ready to say '*mir hat geträumt*' ['I had a dream', literally 'a dream came to me'] as '*ich habe geträumt*' ['I dreamt']. What is the origin of this feeling that dreams are extraneous to our minds? In view of our discussion upon the sources of dreams, we must conclude that the strangeness cannot be due to the material that finds its way into their content, since that material is for the most part common to dreaming and waking life. The question arises whether in dreams there may not be modifications in the processes of the mind which produce the impression we are discussing; and we shall therefore make an attempt at drawing a picture of the psychological attributes of dreams.

No-one has emphasized more sharply the essential difference between dreaming and waking life or drawn more far-reaching conclusions from it than G. T. Fechner in a passage in his *Elemente der Psychophysik* (1889, **2**, 520–1). In his opinion, 'neither the mere lowering of conscious mental life below the main threshold', nor the withdrawal of attention from the influences of the external world, is enough to explain the characteristics of dream life as contrasted with waking life. He suspects, rather, that *the scene of action of dreams is different from that of waking ideational life*. 'If the scene of action of psychophysical activity were the same in sleeping and waking, dreams could, in my view, only be a prolongation at a lower degree of intensity of waking ideational life and, moreover, would necessarily be of the same material and form. But the facts are quite otherwise.'

It is not clear what Fechner had in mind in speaking of this change of location of mental activity; nor, so far as I know, has anyone else pursued the path indicated by his words. We may, I think, dismiss the [49]
possibility of giving the phrase an anatomical interpretation and supposing it to refer to physiological cerebral localization or even to the histological layers of the cerebral cortex. It may be, however, that the suggestion will eventually prove to be sagacious and fertile, if it can be

applied to a *mental* apparatus [*seelischen Apparat*] built up of a number of agencies arranged in a series one behind the other.[1]

Other writers have contented themselves with drawing attention to the more tangible of the distinguishing characteristics of dream life and with taking them as a starting point for attempts at more far-reaching explanations.

It has justly been remarked that one of the principal peculiarities of dream life makes its appearance during the very process of falling asleep and may be described as a phenomenon heralding sleep. According to Schleiermacher (1862, 351), what characterizes the waking state is the fact that thought activity takes place in *concepts* and not in *images*. Now dreams think essentially in images; and with the approach of sleep it is possible to observe how, in proportion as voluntary activities become more difficult, *involuntary ideas* arise, all of which fall into the class of images. Incapacity for ideational work of the kind which we feel as intentionally willed and the emergence (habitually associated with such *states of abstraction*) of images – these are two characteristics which persevere in dreams and which the psychological analysis of dreams forces us to recognize as essential features of dream life. We have already seen [p. 28 ff. above] that these images – hypnagogic hallucinations – are themselves identical in their content to dream images.[2]

Dreams, then, think predominantly in visual images – but not exclusively. They make use of auditory images as well, and, to a lesser extent, of impressions belonging to the other senses. Many things, too, occur in dreams (just as they normally do in waking life) simply as thoughts or ideas – probably, that is to say, in the form of residues of
[50] verbal presentations [*Wortvorstellungsreste*]. Nevertheless, what are truly characteristic of dreams are only those elements of their content which behave like images, which are more like perceptions, that is, than they are like mnemic presentations. Leaving on one side all the arguments, so familiar to psychiatrists, on the nature of hallucinations, we shall be in agreement with every authority on the subject in asserting that dreams *hallucinate* – that they replace thoughts with hallucinations. In this respect there is no distinction between visual and acoustic presentations: it has been observed that if one falls asleep with the memory of a

1 [This idea is taken up and developed in Chapter VII, Section B, of the present work (p. 478 ff. below).]

2 [*Footnote added* 1911:] Silberer (1909) has given some nice examples of the way in which, in a drowsy state, even abstract thoughts become converted into pictorial plastic images which seek to express the same meaning. [*Added* 1925:] I shall have occasion to return to this discovery in another connection. [See pp. 308 f. and 450 ff. below.]

series of musical notes in one's mind, the memory becomes transformed into a hallucination of the same melody; while, if one then wakes up again – and the two states may alternate more than once during the process of dropping asleep – the hallucination gives way in turn to the mnemic presentation, which is at once fainter and qualitatively different from it.

The transformation of ideas into hallucinations is not the only respect in which dreams differ from corresponding thoughts in waking life. Dreams construct a *situation* out of these images; they represent an event which is actually happening; as Spitta (1882, 145) puts it, they '*dramatize*' an idea. But this feature of dream life can only be fully understood if we further recognize that in dreams – as a rule, for there are exceptions which require special examination – we appear not to *think* but to *experience*; that is to say, we attach complete belief to the hallucinations. Not until we wake up does the critical comment arise that we have not experienced anything but have merely been thinking in a peculiar way, or in other words dreaming. It is this characteristic that distinguishes true dreams from daydreaming, which is never confused with reality.

Burdach (1838, 502 f.) summarizes the features of dream life which we have so far discussed in the following words: 'These are among the essential features of dreams: (*a*) In dreams the subjective activity of our minds appears in an objective form, for our perceptive faculties regard the products of our imagination as though they were sense impressions. . . . (*b*) Sleep signifies an end of the authority of the self [*Eigenmächtigkeit*]. Hence falling asleep brings a certain degree of passivity along with it. . . . The images that accompany sleep can occur only on condition that the authority of the self is reduced.'

The next thing is to try to explain the belief which the mind accords [51]
to dream hallucinations, a belief which can only arise after some kind of 'authoritative' activity of the self has ceased. Strümpell (1877) argues that in this respect the mind is carrying out its function correctly and in conformity with its own mechanism. Far from being mere presentations, the elements of dreams are *true* and *real mental experiences* of the same kind as arise in a waking state through the agency of the senses. (Ibid., 34.) The waking mind produces ideas and thoughts in verbal images and in speech; but in dreams it does so in true sensory images. (Ibid., 35.) Moreover, there is a spatial consciousness in dreams, since sensations and images are assigned to an external space, just as they are in waking. (Ibid., 36.) It must therefore be allowed that in dreams the

mind is in the same relation to its images and perceptions as it is in waking. (Ibid., 43.) If it is nevertheless in error in so doing, that is because in the state of sleep it lacks the criterion which alone makes it possible to distinguish between sense perceptions arising from without and from within. It is unable to submit its dream images to the only tests which could prove their objective reality. *In addition to this*, it disregards the distinction between images which are only interchangeable *arbitrarily* and cases where the element of arbitrariness is absent. It is in error because it is unable to apply the law of causality to the content of its dreams. (Ibid., 50–1.) In short, the fact of its having turned away from the external world is also the reason for its belief in the subjective world of dreams.

Delboeuf (1885, 84) arrives at the same conclusion after somewhat different psychological arguments. We believe in the reality of dream images, he says, because in our sleep we have no other impressions with which to compare them, because we are detached from the external world. But the reason why we believe in the truth of these hallucinations is not because it is impossible to put them to the test *within* the dream. A dream can seem to offer us such tests: it can let us touch the rose that we see – and yet we are dreaming. In Delboeuf's opinion there is only one valid criterion of whether we are dreaming or awake, and that is the purely empirical one of the fact of waking up. I conclude that everything I experienced between falling asleep and waking up was illusory, when, on awaking, I find that I am lying undressed in bed. During sleep
[52] I took the dream images as real owing to my mental habit (which cannot be put to sleep) of assuming the existence of an external world with which I contrast my own ego [*Ich*][T].[1]

1 Haffner (1887, 243) attempts, like Delboeuf, to explain the activity of dreaming by the modification which the introduction of an abnormal condition must inevitably produce in the otherwise correct functioning of an intact mental apparatus; but he gives a somewhat different account of that condition. According to him the first mark of a dream is its independence of space and time, i.e. the fact of a presentation being emancipated from the position occupied by the subject in the spatial and temporal order of events. The second basic feature of dreams is connected with this – namely, the fact that hallucinations, phantasies and imaginary combinations are confused with external perceptions. 'All the higher powers of the mind – in particular the formation of concepts and the powers of judgement and inference on the one hand and free self-determination on the other hand – are attached to sensory images and have at all times a background of such images. It follows, therefore, that these higher activities too take their part in the disorderliness of the dream images. I say "take their part", since in themselves our powers of judgement and of will are in no way altered in sleep. Our activities are just as clear-sighted and just as free as in waking life. Even in his dreams a man cannot violate the laws of thought as such – he cannot, for instance, regard as identical things that appear to him as contraries, and so on. So too in dreams he can only desire what he looks upon as a good (*sub ratione boni*). But the human spirit is led astray in dreams in its *application* of the laws of thought and of will through confusing one idea with another. Thus it comes about that we are guilty of the grossest

Detachment from the external world seems thus to be regarded as the factor determining the most marked features of dream life. It is therefore worthwhile quoting some penetrating remarks made long ago by Burdach which throw light on the relations between the sleeping mind and the external world and which are calculated to prevent our setting too great store by the conclusions drawn in the last few pages. 'Sleep', he writes, 'can occur only on condition that the mind is not irritated by sensory stimuli. . . . But the actual precondition of sleep is not so much absence of sensory stimuli as absence of interest in them.[1] Some sense [53] impressions may actually be necessary in order to calm the mind. Thus the miller can only sleep so long as he hears the clacking of his mill; and anyone who feels that burning a night light is a necessary precaution finds it impossible to get to sleep in the dark.' (Burdach, 1838, 482.)

'In sleep the mind isolates itself from the external world and withdraws from its own periphery. . . . Nevertheless, connection is not broken off entirely. If we could not hear or feel while we were actually asleep, but only after we had woken up, it would be impossible to wake us at all. . . . The persistence of sensation is proved even more clearly by the fact that what rouses us is not always the mere sensory strength of an impression but its psychical context: a sleeping man is not aroused by an indifferent word, but if he is called by name he wakes. . . . Thus the mind in sleep distinguishes between sensations. . . . It is for that reason that the absence of a sensory stimulus can wake a man if it is related to something of ideational importance to him; so it is that the man with the night light wakes if it is extinguished and the miller is roused if his mill comes to a stop. He is awakened, that is, by the cessation of a sensory activity; and this implies that that activity was perceived by him, but, since it was indifferent, or rather satisfying, did not disturb his mind.' (Ibid., 485–6.)

Even if we disregard these objections – and they are by no means trifling ones – we shall have to confess that the features of dream life which we have considered hitherto, and which have been ascribed to its detachment from the external world, do not account completely for its strange character. For it should be possible otherwise to turn the

contradictions in dreams, while at the same time we can make the clearest judgements, draw the most logical inferences and come to the most virtuous and saintly decisions. . . . Lack of orientation is the whole secret of the flights taken by our imagination in dreams, and lack of critical reflection and of communication with other people is the main source of the unbridled extravagance exhibited in dreams by our judgements as well as by our hopes and wishes.' (Ibid., 18.) [The problem of 'reality-testing' is considered later, on p. 506 f. below.]

1 [*Footnote added* 1914:] Cf. the '*désintérêt*' which Claparède (1905, 306 f.) regards as the mechanism of falling asleep.

hallucinations in a dream[t] back into ideas, and its situations into thoughts, and in that way to solve the problem of dream interpretation. And that in fact is what we are doing when, after waking, we reproduce a dream from memory; but, whether we succeed in making this retranslation wholly or only in part, the dream remains no less enigmatic than before.

And indeed all the authorities unhesitatingly assume that yet other and more deep-going modifications of the ideational material of waking
[54] life take place in dreams. Strümpell (1877, 27–8) has endeavoured to put his finger on one such modification in the following passage: 'With the cessation of sensory functioning and of normal vital consciousness, the mind loses the soil in which its feelings, desires, interests and activities are rooted. The psychical states, too – feelings, interests, judgements of value – which are linked to mnemic images in waking life, are subjected to . . . an obscuring pressure, as a result of which their connection with those images is broken; perceptual images of things, persons, places, events and actions in waking life are reproduced separately in great numbers, but none of them carries its *psychical value* along with it. That value is detached from them and they thus float about in the mind at their own sweet will. . . .' According to Strümpell, the fact of images being denuded of their psychical value (which in turn goes back to detachment from the external world) plays a principal part in creating the impression of strangeness which distinguishes dreams from actual life in our memory.

We have seen [cf. p. 44 above] that falling asleep at once involves the loss of one of our mental activities, namely our power of giving intentional guidance to the sequence of our ideas. We are now faced with the suggestion, which is in any case a plausible one, that the effects of the state of sleep may extend over *all* the faculties of the mind. Some of these seem to be entirely suspended; but the question now arises whether the rest continue to operate normally and whether under such conditions they are *capable* of normal work. And here it may be asked whether the distinguishing features of dreams cannot be explained by the lowering of psychical efficiency in the sleeping state – a notion which finds support in the impression made by dreams on our waking judgement. Dreams are disconnected, they accept the most violent contradictions without the least objection, they admit impossibilities, they disregard knowledge which carries great weight with us in the daytime, they reveal us as ethical and moral imbeciles. Anyone who when he was awake behaved in the sort of way that is shown in situations in dreams

would be considered insane. Anyone who when he was awake talked in the sort of way that people talk in dreams or described the sort of thing that happens in dreams would give us the impression of being muddle-headed or feeble-minded. It seems to be no more than putting the truth into words when we express our very low opinion of mental activity in [55] dreams and assert that in dreams the higher intellectual faculties in particular are suspended or at all events gravely impaired.

The authorities display unusual unanimity – exceptions will be treated later [p. 53 ff. below] – in expressing opinions of this kind on dreams; and these judgements lead directly to a particular theory or explanation of dream life. But it is time for me to leave generalities and to give instead a series of quotations from various writers – philosophers and physicians – upon the psychological characteristics of dreams.

According to Lemoine (1855), the 'incoherence' of dream images is the one essential characteristic of dreams.

Maury (1878, 163) agrees with him: 'Il n'y a pas de rêves absolument raisonnables et qui ne contiennent quelque incohérence, quelque anachronisme, quelque absurdité.'[1]

Spitta [1882, 193] quotes Hegel as saying that dreams are devoid of all objective and reasonable coherence.

Dugas [1897*a*, 417] writes: 'Le rêve c'est l'anarchie psychique affective et mentale, c'est le jeu des fonctions livrées à elles-mêmes et s'exerçant sans contrôle et sans but; dans le rêve l'esprit est un automate spirituel.'[2]

Even Volkelt (1875, 14), whose theory is far from regarding psychical activity during sleep as purposeless, speaks of 'the relaxing, disconnecting and confusing of ideational life, which in the waking state is held together by the logical force of the central ego.'

The *absurdity* of the associations of ideas that occur in dreams could scarcely be criticized more sharply than it was by Cicero (*De divinatione*, II, [lxxi, 146]): 'Nihil tam praepostere, tam incondite, tam monstruose cogitari potest, quod non possimus somniare.'[3]

Fechner (1889, **2**, 522) writes: 'It is as though psychological activity had been transported from the brain of a reasonable man into that of a fool.'

Radestock (1879, 145): 'In fact, it seems impossible to detect any fixed [56] laws in this crazy activity. After withdrawing from the strict policing

1 ['There are no dreams that are *absolutely* reasonable and that do not contain *some* incoherence, anachronism or absurdity.']

2 ['A dream is psychical, emotional and mental anarchy; it is the play of functions left to their own devices and acting without control or purpose; in dreams the spirit becomes a spiritual automaton.']

3 ['There is no imaginable thing too absurd, too involved, or too abnormal for us to dream about it.' (Falconer's translation in the Loeb Classical Library, 1922, 533.)]

exercised over the course of waking ideas by the rational will and the attention, dreams melt into a mad whirl of kaleidoscopic confusion.'

Hildebrandt (1875, 45): 'What astonishing leaps a dreamer may make, for instance, in drawing inferences! How calmly he is prepared to see the most familiar lessons of experience turned upside down. What laughable contradictions he is ready to accept in the laws of nature and society before, as we say, things get beyond a joke and the excessive strain of nonsense wakes him up. We calculate without a qualm that three times three make twenty; we are not in the least surprised when a dog quotes a line of poetry, or when a dead man walks to his grave on his own legs, or when we see a rock floating on the water; we proceed gravely on an important mission to the Duchy of Bernburg or to the Principality of Liechtenstein to inspect their naval forces; or we are persuaded to enlist under Charles XII shortly before the battle of Poltava.'

Binz (1878, 33), having in mind the theory of dreams which is based upon such impressions as these, writes: 'The content of at least nine out of ten dreams is nonsensical. We bring together in them people and things that have no connection whatever with one another. Next moment there is a shift in the kaleidoscope and we are faced with a new grouping, more senseless and crazy, if possible, than the last. And so the changing play of the incompletely sleeping brain goes on, till we awake and clasp our forehead and wonder whether we still possess the capacity for rational ideas and thoughts.'

Maury (1878, 50) finds a parallel to the relation between dream images and waking thoughts which will be highly significant to physicians: 'La production de ces images que chez l'homme éveillé fait le plus souvent naître la volonté, correspond, pour l'intelligence, à ce que sont pour la motilité certains mouvements que nous offre la chorée et les affections
[57] paralytiques. . . .'[1] He further regards dreams as 'toute une série de dégradations de la faculté pensante et raisonnante'. (Ibid., 27.)[2]

It is scarcely necessary to quote the writers who repeat Maury's opinion in relation to the various higher mental functions. Strümpell (1877, 26), for instance, remarks that in dreams – even, of course, where there is no manifest nonsense – there is an eclipse of all the logical operations of the mind which are based on relations and connections. Spitta (1882, 148) declares that ideas that occur in dreams seem to be completely withdrawn from the law of causality. Radestock (1879, [153–4]) and other

1 ['The production of these images (which in a waking person are usually provoked by the will) corresponds in the sphere of intelligence to the place taken in the sphere of motion by some of the movements observable in chorea and paralytic disorders.']

2 ['A whole series of degradations of the thinking and reasoning faculty.']

writers insist upon the weakness of judgement and inference characteristic of dreams. According to Jodl (1896, 123), there is no critical faculty in dreams, no power of correcting one set of perceptions by reference to the general content of consciousness. The same author remarks that 'every kind of conscious activity occurs in dreams, but only in an incomplete, inhibited and isolated fashion.' The contradictions with our waking knowledge in which dreams are involved are explained by Stricker (1879, 98) and many others as being due to facts being forgotten in dreams or to logical relations between ideas having disappeared. And so on, and so on.

Nevertheless, the writers who in general take so unfavourable a view of psychical functioning in dreams allow that a certain remnant of mental activity still remains in them. This is explicitly admitted by Wundt, whose theories have had a determining influence on so many other workers in this field. What, it may be asked, is the nature of the remnant of normal mental activity which persists in dreams? There is fairly general agreement that the reproductive faculty, the memory, seems to have suffered least, and indeed that it shows a certain superiority to the same function in waking life (see Section B above), though some part of the absurdities of dreaming seems to be explicable by its forgetfulness. In the opinion of Spitta (1882, 84 f.) the part of the mind which is not affected by sleep is the life of the sentiments and it is this which directs dreams. By 'sentiment' ['*Gemüt*'] he means 'the stable assemblage of feelings which constitutes the innermost subjective essence of a human being'.

Scholz (1893, 64) believes that one of the mental activities operating in dreams is a tendency to subject the dream material to 'reinterpretation [58] in allegorical terms'. Siebeck too (1877, 11) sees in dreams a faculty of the mind for 'wider interpretation', which is exercised upon all sensations and perceptions. There is particular difficulty in assessing the position in dreams of what is ostensibly the highest of the psychical functions, that of consciousness. Since all that we know of dreams is derived from consciousness, there can be no doubt of its persisting in them; yet Spitta (1882, 84–5) believes that what persists in dreams is only consciousness and not *self*-consciousness. Delboeuf (1885, 19), however, confesses that he is unable to follow the distinction.

The laws of association [*Assoziationsgesetze*] governing the sequence of ideas hold good of dream images, and indeed their dominance is even more clearly and strongly expressed in dreams. 'Dreams', says Strümpell (1877, 70), 'run their course, as it seems, according to the laws either of

bare ideas or of organic stimuli accompanying such ideas – that is, without being in any way affected by reflection or commonsense or aesthetic taste or moral judgement.' [See pp. 48 f. above and 196 f. below.]

The authors whose views I am now giving picture the process of forming [*Bildung*][T] dreams in some such way as this. The totality of the sensory stimuli generated during sleep from the various sources which I have already enumerated [see Section C above] arouse in the mind in the first place a number of ideas, which are represented in the form of hallucinations or more properly, according to Wundt [see p. 37 above], of illusions, in view of their derivation from external and internal stimuli. These ideas become linked together according to the familiar laws of association and, according to the same laws, call up a further series of ideas (or images). The whole of this material is then worked over, so far as it will allow, by what still remain in operation of the organizing and thinking faculties of the mind. (See, for instance, Wundt [1874, 658] and Weygandt [1893].) All that remain undiscovered are the motives [*Motive*][T] which decide whether the calling up of images arising from non-external sources shall proceed along one chain of associations or another.

It has often been remarked, however, that the associations connecting dream images with one another are of a quite special kind and differ from those which operate in waking thought. Thus Volkelt (1875, 15) writes: 'In dreams the associations seem to play at catch-as-catch-can in
[59] accordance with chance similarities and connections that are barely perceptible. Every dream is stuffed full of slovenly and perfunctory associations of this kind.' Maury (1878, 126) attaches very great importance to this feature of the way in which ideas are linked in dreams, since it enables him to draw a close analogy between dream life and certain mental disorders. He specifies two main features of a '*délire*': '(1) une action spontanée et comme automatique de l'esprit; (2) une association vicieuse et irrégulière des idées.'[1] Maury himself gives two excellent instances of dreams of his own in which dream images were linked together merely through a similarity in the sound of words. He once dreamt that he was on a pilgrimage (*pélerinage*) to Jerusalem or Mecca; after many adventures he found himself visiting *Pelle*tier, the chemist, who, after some conversation, gave him a zinc shovel (*pelle*); in the next part of the dream this turned into a great broadsword. (Ibid., 137.) In

1 ['(1) A mental act which is spontaneous and as it were automatic; (2) an invalid and irregular association of ideas.' – *N.B.* In French (and similarly in German) psychiatry '*délire*' has the meaning of a delusional state.]

another dream he was walking along a highway and reading the number of *kilo*metres on the milestones; then he was in a grocer's shop where there was a big pair of scales, and a man was putting *kilo*gramme weights into the scale in order to weigh Maury; the grocer then said to him: 'You're not in Paris but on the island of *Gilolo*.' Several other scenes followed, in which he saw a *Lo*belia flower, and then General *Lo*pez, of whose death he had read shortly before. Finally, while he was playing a game of *lo*tto, he woke up. (Ibid., 126.)[1]

We shall no doubt be prepared to find, however, that this low estimate of psychical functioning in dreams has not been allowed to pass without contradiction – though contradiction on this point would seem to be no easy matter. For instance, Spitta (1882, 118), one of the disparagers of dream life, insists that the same psychological laws which regulate waking life also hold good in dreams; and another, Dugas (1897*a*), declares that 'le rêve n'est pas déraison ni même irraison pure'.[2] But such assertions carry [60]
little weight so long as their authors make no attempt to reconcile them with their own descriptions of the psychical anarchy and disruption of every function that prevail in dreams. It seems, however, to have dawned upon some other writers that the madness of dreams may not be without method and may even be simulated, like that of the Danish prince on whom this shrewd judgement was passed. These latter writers cannot have judged by appearances; or the appearance presented to them by dreams must have been a different one.

Thus Havelock Ellis (1899*a*, 721), without dwelling on the apparent absurdity of dreams, speaks of them as 'an archaic world of vast emotions and imperfect thoughts', the study of which might reveal to us primitive stages in the evolution of mental life.

The same view [*Auffassung*][3] is expressed by James Sully (1893, 362) in a manner that is both more sweeping and more penetrating. His words deserve all the more attention when we bear in mind that he was more firmly convinced, perhaps, than any other psychologist that dreams have a disguised meaning. 'Now our dreams are a means of conserving these successive [earlier] personalities. *When asleep we go back to the old ways of looking at things and of feeling about them, to impulses and activities which long ago dominated us*.'

The sagacious Delboeuf (1885, 222) declares (though he puts himself in

1 [*Footnote added* 1909:] At a later stage [p. 474 *n.* 2 below] we shall come to understand the meaning of dreams such as this which are filled with alliterations and similar-sounding first syllables.

2 ['Dreams are not contrary to reason or even entirely lacking in reason.']

3 [This paragraph was added in 1914.]

the wrong by not giving any refutation of the material which contradicts his thesis): 'Dans le sommeil, hormis la perception, toutes les facultés de l'esprit, intelligence, imagination, mémoire, volonté, moralité, restent intactes dans leur essence; seulement elles s'appliquent à des objets imaginaires et mobiles. Le songeur est un acteur qui joue à volonté les fous et les sages, les bourreaux et les victimes, les nains et les géants, les démons et les anges.'[1]

The most energetic opponent of those who seek to depreciate psychical functioning in dreams seems to be the Marquis d'Hervey de
[61] Saint-Denys [1867], with whom Maury carried on a lively controversy, and whose book, in spite of all my efforts, I have not succeeded in procuring.[2] Maury (1878, 19) writes of him: 'M. le Marquis d'Hervey prête à l'intelligence durant le sommeil, toute sa liberté d'action et d'attention et il ne semble faire consister le sommeil que dans l'occlusion des sens, dans leur fermeture au monde extérieur; en sorte que l'homme qui dort ne se distingue guère, selon sa manière de voir, de l'homme qui laisse vaguer sa pensée en se bouchant les sens; toute la différence qui sépare alors la pensée ordinaire de celle du dormeur c'est que, chez celui-ci, l'idée prend une forme visible, objective et ressemble, à s'y méprendre, à la sensation déterminée par les objets extérieurs; le souvenir revêt l'apparence du fait présent.'[3] To this Maury adds 'qu'il y a une différence de plus et capitale à savoir que les facultés intellectuelles de l'homme endormi n'offrent pas l'équilibre qu'elles gardent chez l'homme éveillé.'[4]

Vaschide (1911, 146 f.)[5] gives us a clearer account of Hervey de Saint-Denys' book and quotes a passage from it [1867, 35] upon the apparent incoherence of dreams: 'L'image du rêve est la copie de l'idée. Le principal est l'idée; la vision n'est qu'accessoire. Ceci établi, il faut savoir suivre la marche des idées, il faut savoir analyser le tissu des rêves;

1 ['In sleep, all the mental faculties (except for perception) – intelligence, imagination, memory, will and morality – remain essentially intact; they are merely applied to imaginary and unstable objects. A dreamer is an actor who at his own will plays the parts of madmen and philosophers, of executioners and their victims, of dwarfs and giants, of demons and angels.']

2 [This work, by a famous sinologist, was published anonymously.]

3 ['The Marquis d'Hervey attributes complete liberty of action and attention to the intelligence during sleep, and he seems to think that sleep consists merely in the blocking of the senses, in their being closed to the external world. So that on his view a sleeping man would hardly be different from a man who shut off his senses and allowed his thoughts to wander; the only distinction between ordinary thoughts and those of a sleeper would be that, in the latter, ideas assume a visible and objective shape and are indistinguishable from sensations determined by external objects, while memories take on the appearance of present events.']

4 ['There is a further distinction and one of capital importance: namely, that the intellectual faculties of a sleeping man do not exhibit the balance maintained in a man who is awake.']

5 [This paragraph and the next were added in 1914.]

l'incohérence devient alors compréhensible, les conceptions les plus fantasques deviennent des faits simples et parfaitement logiques. . . . Les rêves les plus bizarres trouvent même une explication des plus logiques quand on sait les analyser.'[1]

Johan Stärcke (1913, 243) has pointed out that a similar explanation of [62]
the incoherence of dreams was put forward by an earlier writer, Wolf Davidson (1799, 136), whose work was unknown to me: 'The remarkable leaps taken by our ideas in dreams all have their basis in the law of association; sometimes, however, these connections occur in the mind very obscurely, so that our ideas often seem to have taken a leap when, in fact, there has been none.'

The literature of the subject thus shows a very wide range of variation in the value which it assigns to dreams as psychical products. This range extends from the deepest disparagement, of the kind with which we have become familiar, through hints at a yet undisclosed worth, to an overvaluation which ranks dreams far higher than any of the functions of waking life. Hildebrandt (1875, 19 f.), who, as we have heard [see above, p. 8], has summed up the whole of the psychological features of dream life in three antinomies, makes use of the two extreme ends of this range of values for his third paradox: 'it is a contrast between an intensification of mental life, an enhancement of it that not infrequently amounts to virtuosity, and, on the other hand, a deterioration and enfeeblement which often sinks below the level of humanity. As regards the former, there are few of us who could not affirm, from our own experience, that there emerges from time to time in the creations and fabrics of the genius of dreams a depth and intimacy of emotion, a tenderness of feeling, a clarity of vision, a subtlety of observation, and a brilliance of wit such as we should never claim to have at our permanent command in our waking lives. There lies in dreams a marvellous poetry, an apt allegory, an incomparable humour, a rare irony. A dream looks upon the world in a light of strange idealism and often enhances the effects of what it sees by its deep understanding of their essential nature. It pictures earthly beauty to our eyes in a truly heavenly splendour and clothes dignity with the highest majesty, it shows us our everyday fears in the ghastliest shape and turns our amusement into

1 ['Dream images are copies of ideas. The essential thing is the idea, the vision is a mere accessory. When this is once established, we must know how to follow the sequence of the ideas, we must know how to analyse the texture of dreams; their incoherence then becomes intelligible, and the most fantastic notions become simple and perfectly logical facts. . . . We can even find a most logical explanation for the strangest dreams if we know how to analyse them.' – This is not in fact a verbatim quotation from Hervey de Saint-Denys, but a paraphrase by Vaschide.]

[63] jokes of indescribable pungency. And sometimes, when we are awake and still under the full impact of an experience like one of these, we cannot but feel that never in our life has the real world offered us its equal.'

We may well ask whether the disparaging remarks quoted on earlier pages and this enthusiastic eulogy can possibly relate to the same thing. Is it that some of our authorities have overlooked the nonsensical dreams and others the profound and subtle ones? And if dreams of both kinds occur, dreams that justify both estimates, may it not be a waste of time to look for any distinguishing psychological feature of dreams? Will it not be enough to say that in dreams *anything* is possible – from the deepest degradation of mental life to an exaltation of it which is rare in waking hours? However convenient a solution of this kind might be, what lies against it is the fact that all of the efforts at research into the problem of dreams seem to be based on a conviction that some distinguishing feature *does* exist, which is universally valid in its essential outline and which would clear these apparent contradictions out of the way.

There can be no doubt that the psychical achievements [*Leistungen*] of dreams received readier and warmer recognition during the intellectual period which has now been left behind, when the human mind was dominated by philosophy and not by the exact natural sciences. Pronouncements such as that by Schubert (1814, 20 f.) that dreams are a liberation of the spirit from the power of external nature, a freeing of the soul from the bonds of the senses, and similar remarks by the younger Fichte (1864, **1**, 143 f.)[1] and others, all of which represent dreams as an elevation of mental life to a higher level, seem to us now to be scarcely intelligible; today they are repeated only by mystics and pietists.[2] The introduction of the scientific mode of thought has brought along with it a reaction in the estimation of dreams. Medical writers especially tend to regard psychical activity in dreams as trivial and valueless; while philosophers and non-professional observers – amateur psychologists
[64] – whose contributions to this particular subject are not to be despised, have (in closer alignment with popular feeling) retained a belief in the psychical value of dreams. Anyone who is inclined to take a low view of psychical functioning in dreams will naturally prefer to assign their source to somatic stimulation; whereas those who believe that the

1 Cf. Haffner (1887) and Spitta (1882, 11 f.).

2 [*Footnote added* 1914:] That brilliant mystic Du Prel, one of the few authors for whose neglect in earlier editions of this book I should wish to express my regret, declares that the gateway to metaphysics, so far as men are concerned, lies not in waking life but in the dream. (Du Prel, 1885, 59.)

dreaming mind retains the greater part of its waking capacities have of course no reason for denying that the stimulus to dreaming can arise within the dreaming mind itself.

Of the superior faculties which even a sober comparison may be inclined to attribute to dream life, the most marked is that of memory; we have already [in Section B above] discussed at length the not uncommon evidence in favour of this view. Another point of superiority in dream life, often praised by earlier writers – that it rises superior to distance in time and space – may easily be shown to have no basis in fact. As Hildebrandt (1875, [25]) points out, this advantage is an illusory one; for dreaming rises superior to time and space in precisely the same way as does waking thought, and for the very reason that it is merely a form of thought. It has been claimed for dreams that they enjoy yet another advantage over waking life in relation to time – that they are independent of the passage of time in yet another respect. Dreams such as the one dreamt by Maury of his own guillotining (see above, p. 24) seem to show that a dream is able to compress into a very short space of time an amount of perceptual matter far greater than the amount of ideational matter that can be dealt with by our waking mind. This conclusion has, however, been countered by various arguments; since the papers by Le Lorrain (1894) and Egger (1895) on the apparent duration of dreams, a long and interesting discussion on the subject has developed, but it seems unlikely that the last word has yet been said on this subtle question and the deep implications which it involves.[1]

Reports of numerous cases as well as the collection of instances made by Chabaneix (1897) seem to put it beyond dispute that dreams can carry on the intellectual work of daytime and bring it to conclusions which had not been reached during the day, and that they can resolve doubts and problems and be the source of new inspiration for poets and musical composers. But though the *fact* may be beyond dispute, its implications are open to many doubts, which raise matters of principle.[2] [65]

Lastly, dreams are reputed to have the power of divining the future. Here we have a conflict in which almost insuperable scepticism is met with obstinately repeated assertions. No doubt we shall be acting rightly in not insisting that this view has no basis at all in fact, since it is possible that before long a number of the instances cited may find an explanation within the bounds of natural psychology.[3]

1 [*Footnote added* 1914:] A further bibliography and a critical discussion of these problems can be found in Tobowolska (1900). [Cf. also p. 443 ff. below.]

2 [*Footnote added* 1914:] Cf. the criticism in Havelock Ellis (1911*a*, 265). [See also below, p. 505.]

3 [Cf. the posthumously published paper by Freud (1941*c*) printed as an Appendix at the end of this work (p. 562 ff. below).]

(F)
THE MORAL SENSE IN DREAMS

[66] For reasons which will only become apparent after my own investigations into dreams have been taken into account, I have isolated from the subject of the psychology of dreams the special problem of whether and to what extent moral dispositions and feelings extend into dream life. Here too we are met with the same contradictory views which, curiously enough, we have found adopted by different authors in regard to all the other functions of the mind during dreams. Some assert that the dictates of morality have no place in dreams, while others maintain no less positively that the moral character of man persists in his dream life.

Appeal to the common experience of dreams seems to establish beyond any doubt the correctness of the former of these views. Jessen (1855, 553) writes: 'Nor do we become better or more virtuous in sleep. On the contrary, conscience seems to be silent in dreams, for we feel no pity in them and may commit the worst crimes – theft, violence and murder – with complete indifference and with no subsequent feelings of remorse.'

Radestock (1879, 164): 'It should be borne in mind that associations occur and ideas are linked together in dreams without any regard for reflection, common sense, aesthetic taste or moral judgement. Judgement is extremely weak and ethical indifference reigns supreme.'

Volkelt (1875, 23): 'In dreams, as we are all aware, proceedings are especially unbridled in sexual matters. The dreamer himself is utterly shameless and devoid of any moral feeling or judgement; moreover, he sees everyone else, including those for whom he has the deepest respect, engaged in acts with which he would be horrified to associate them while he was awake, even in his thoughts.'

In diametrical opposition to these, we find statements such as Schopenhauer's [1851*b*, **1**, 245] that everyone who figures in a dream acts and speaks in complete accordance with his character. K. P. Fischer (1850, 72 f.), quoted by Spitta (1882, 188), declares that subjective feelings
[67] and longings, or affects and passions, reveal themselves in the freedom of dream life, and that people's moral characteristics are reflected in their dreams.

Haffner (1887, 251): 'With rare exceptions . . . a virtuous man will be

virtuous in his dreams as well; he will resist temptations and will keep himself aloof from hatred, envy, anger and all other vices. But a sinful man will as a rule find in his dreams the same images that he had before his eyes while he was awake.'

Scholz [Jewett's translation, 1893, 62]: 'In dreams is truth: in dreams we learn to know ourselves as we are in spite of all the disguises we wear to the world, [whether they be ennobling or humiliating]. . . . The honourable man cannot commit a crime in dreams, or if he does he is horrified over it as over something contrary to his nature. The Roman Emperor who put a man to death who had dreamt that he had assassinated the ruler was justified in so doing if he reasoned that the thoughts one has in dreams one has, too, when awake. The common expression "I wouldn't dream of such a thing" has a doubly correct significance when it refers to something which can have no lodgement in our hearts or mind.' (Plato, on the contrary, thought that the best men are those who only *dream* what other men *do* in their waking life.)[1]

Pfaff (1868, [9]), quoted by Spitta (1882, 192), alters the wording of a familiar saying: 'Tell me some of your dreams, and I will tell you about your inner self.'

The problem of morality in dreams is taken as the centre of interest by Hildebrandt, from whose small volume I have already quoted so much – for, of all the contributions to the study of dreams which I have come across, it is the most perfect in form and the richest in ideas. Hildebrandt [1875, 54] too lays it down as a rule that the purer the life the purer the dream, and the more impure the one the more impure the other. He believes that man's moral nature persists in dreams. 'Whereas', he writes, 'even the grossest mistake in arithmetic, even the most romantic reversal of scientific laws, even the most ridiculous anachronism fails to upset us or even to arouse our suspicions, yet we never lose sight of the distinction between good and evil, between right and wrong or between virtue and vice. However much of what accompanies us in the [68]
daytime may drop away in our sleeping hours, Kant's categorical imperative is a companion who follows so close at our heels that we cannot be free of it even in sleep. . . . But this can only be explained by the fact that what is fundamental in man's nature, his moral being, is too firmly fixed to be affected by the kaleidoscopic shuffling to which the imagination, the reason, the memory and other such faculties must submit in dreams.' (Ibid., 45 f.)

1 [This sentence was added in 1914. Cf. also p. 554 below. The reference is no doubt to the opening sections of Book IX of the *Republic*. (*Trans.*, 1871, 409 f.)]

As the discussion of this subject proceeds, however, both groups of writers begin to exhibit remarkable shifts and inconsistencies in their opinions. Those who maintain that the moral personality of man ceases to operate in dreams should, in strict logic, lose all interest in immoral dreams. They could rule out any attempt at holding a dreamer responsible for his dreams, or at deducing from the wickedness of his dreams that he had an evil streak in his character, just as confidently as they would reject a similar attempt at deducing from the absurdity of his dreams that his intellectual activities in waking life were worthless. The other group, who believe that the 'categorical imperative' extends to dreams, should logically accept unqualified responsibility for immoral dreams. We could only hope for their sake that they would have no such reprehensible dreams of their own to upset their firm belief in their own moral character.

It appears, however, that no-one is as confident as all that of how far he is good or bad, and that no-one can deny [*verleugnen*][T] the recollection of immoral dreams of his own. For writers in both groups, irrespective of the opposition between their opinions on dream morality, make efforts at explaining the origin of immoral dreams; and a fresh difference of opinion develops, according as their origin is sought in the functions of the mind or in deleterious effects produced on the mind by somatic causes. Thus the compelling logic of facts forces the supporters of both the responsibility and the irresponsibility of dream life to unite in recognizing that the immorality of dreams has a specific psychical source.

Verleugnung

Those who believe that morality extends to dreams are, however, all careful to avoid assuming *complete* responsibility for their dreams. Thus Haffner (1887, 250) writes: 'We are not responsible for our dreams, since our thought and will have been deprived in them of the basis upon which alone our life possesses truth and reality . . . For that reason no dream wishes or dream actions can be virtuous or sinful.' Nevertheless, he goes on, men are responsible for their sinful dreams insofar as they cause them indirectly. They have the duty of morally cleansing their minds not only in their waking life but more especially before going to sleep.

[69]

Hildebrandt [1875, 48 f.] presents us with a far deeper analysis of this mingled rejection and acceptance of responsibility for the moral content of dreams. He argues that in considering the immoral appearance of dreams allowance must be made for the dramatic form in which they are couched, for their compression of the most complicated processes of reflection into the briefest periods of time, as well as for the way in which, as even he admits, the ideational elements of dreams become confused and deprived of their significance. He confesses that he has the

greatest hesitation, nevertheless, in thinking that all responsibility for sins and faults in dreams can be repudiated.

'When we are anxious to disown some unjust accusation, especially one that relates to our aims and intentions, we often use the phrase "I should never dream of such a thing". We are in that way expressing, on the one hand, our feeling that the region of dreams is the most remote and furthest in which we are answerable for our thoughts, since thoughts in that region are so loosely connected with our essential self that they are scarcely to be regarded as ours; but nevertheless, since we feel obliged expressly to deny the existence of these thoughts in this region, we are at the same time admitting indirectly that our self-justification would not be complete unless it extended so far. And I think that in this we are speaking, although unconsciously, the language of truth.' (Ibid., 49.)

'It is impossible to think of any action in a dream for which the original motive has not in some way or other – whether as a wish, or desire or impulse [*Regung*] – passed through the waking mind.' We must admit, Hildebrandt proceeds, that this original impulse was not invented by the dream; the dream merely copied it and spun it out, it merely elaborated in dramatic form a scrap of historical material which it had found in us; it merely dramatized the Apostle's words: 'Whosoever hateth his brother is a murderer.' [1 John iii, 15.] And although after we have awoken, conscious of our moral strength, we may smile at the whole elaborate structure [*Gebilde*] of the sinful dream, yet the original material from which the structure was derived will fail to raise a smile. We feel responsible for the dreamer's errors – not for the whole amount [70] of them, but for a certain percentage. 'In short, if we understand in this scarcely disputable sense Christ's saying that "out of the heart proceed evil thoughts" [Matt. xv, 19], we can hardly escape the conviction that a sin committed in a dream bears with it at least an obscure minimum of guilt.' (Hildebrandt, 1875, 51 ff.)

Thus Hildebrandt finds the source of immorality in dreams in the germs and hints of evil impulses which, in the form of temptations, pass through our minds during the day; and he does not hesitate to include these immoral elements in his estimate of a person's moral value. These same thoughts, as we know, and this same estimate of them, are what have led the pious and saintly in every age to confess themselves miserable sinners.[1]

1 [*Footnote added* 1914:] It is of some interest to learn the attitude of the Inquisition to our problem. In Caesar Careña's *Tractatus de officio sanctissimae Inquisitionis* (1631), the following passage occurs: 'If anyone speaks heresies in a dream, the inquisitors should take occasion to enquire into his way of life, for what occupies a man during the day is wont to come again in his sleep.' (Communicated by Dr Ehniger, St Urban, Switzerland.)

There can, of course, be no doubt as to the general existence of such incompatible ideas; they occur in most people and in spheres other than that of ethics. Sometimes, however, they have been judged less seriously. Spitta (1882, 194) quotes some remarks by Zeller [1818, 120–1], which are relevant in this connection: 'A mind is seldom so happily organized as to possess complete power at every moment and not to have the regular and clear course of its thoughts constantly interrupted not only by inessential but by positively grotesque and nonsensical ideas. Indeed, the greatest thinkers have had to complain of this dreamlike, teasing and tormenting rabble of ideas, which have disturbed their deepest reflections and their most solemn and earnest thoughts.'

A more revealing light is thrown upon the psychological position of these incompatible thoughts by another remark of Hildebrandt's (1875, 55), to the effect that dreams give us an occasional glimpse into depths and recesses of our nature to which we usually have no access in our waking state. Kant expresses the same idea in a passage in his [71] *Anthropologie* [1798][1] in which he declares that dreams seem to exist in order to show us our hidden natures and to reveal to us, not what we are, but what we might have been if we had been brought up differently. Radestock (1879, 84), too, says that dreams often do no more than reveal to us what we would not admit to ourselves and that it is therefore unfair of us to stigmatize them as liars and deceivers. Erdmann [1852, 115] writes: 'Dreams have never shown me what I ought to think of a man; but I have occasionally learnt from a dream, greatly to my own astonishment, what I *do* think of a man and how I feel towards him.' Similarly I. H. Fichte (1864, **1**, 539) remarks: 'The nature of our dreams gives a far more truthful reflection of our whole disposition than we are able to learn of it from self-observation in waking life.'[2]

It will be seen that the emergence of impulses which are foreign to our moral consciousness is merely analogous to what we have already learnt – the fact that dreams have access to ideational material which is absent in our waking state or plays but a small part in it. Thus Benini (1898, 149) writes: 'Certe nostre inclinazioni che si credevano soffocate e spente da un pezzo, si ridestano; passioni vecchie e sepolte rivivono; cose e persone a cui non pensiamo mai, ci vengono dinanzi.'[3] And Volkelt (1875, 105): 'Ideas, too, which have entered waking consciousness

1 [Not traceable.]

2 [The two last sentences were added in 1914.]

3 ['Certain of our desires which have seemed for a time to be stifled and extinguished are reawakened; old and buried passions come to life again; things and persons of whom we never think appear before us.']

almost unnoticed and have perhaps never again been called to memory, very frequently announce their presence in the mind through dreams.' At this point, finally, we may recall Schleiermacher's assertion [see above, p. 44] that the act of falling asleep is accompanied by the appearance of 'involuntary ideas' or images.

We may, then, class together under the heading of 'involuntary ideas' the whole of the ideational material the emergence of which, alike in immoral and in absurd dreams, causes us so much bewilderment. There is, however, one important point of difference: involuntary ideas in the moral sphere contradict our usual attitude of mind, whereas the others merely strike us as strange. No step has yet been taken towards a deeper knowledge which would resolve this distinction.

The question next arises as to the *significance* of the appearance of involuntary ideas in dreams, as to the light which the emergence during the night of these morally incompatible impulses throws upon the psychology of the waking and dreaming mind. And here we find a fresh division of opinion and yet another different grouping of the authorities. The line of thought adopted by Hildebrandt and others who share his fundamental position inevitably leads to the view that immoral impulses possess a certain degree of power even in waking life, though it is an inhibited [*gehemmt*][T] power, unable to force its way into action, and that in sleep something is put out of action which acts like an inhibition [*Hemmung*] in the daytime and has prevented us from being aware of the existence of such impulses. Thus dreams would reveal the true nature of man, though not his *whole* nature, and they would constitute one means of rendering the hidden interior of the mind accessible to our knowledge. Only upon some such premises as these can Hildebrandt [1875, 56] base his attribution to dreams of warning powers, which draw our attention to moral infirmities in our mind, just as physicians admit that dreams can bring unobserved physical illnesses to our conscious notice. So, too, Spitta must be adopting this view when, in speaking [1882, 193 f.] of the sources of excitation [*Erregungsquellen*] which impinge upon the mind (at puberty, for instance), he consoles the dreamer with the assurance that he will have done all that lies within his power if he leads a strictly virtuous life in his waking hours, and if he takes care to suppress sinful thoughts whenever they arise and to prevent their maturing and turning into acts. According to this view we might define the 'involuntary ideas' as ideas which had been 'suppressed' during the day, and we should have to regard their emergence as a genuine mental phenomenon.

[72]

Hemmung

Other writers, however, regard this last conclusion as unjustifiable. Thus Jessen (1855, 360) believes that involuntary ideas, both in dreams and in waking, and in feverish and other delirious conditions, 'have the character of a volitional activity that has been put to rest and of a more or less mechanical succession of images and ideas provoked by internal impulses'. All that an immoral dream proves as to the dreamer's mental life is, in Jessen's view, that on some occasion he had cognizance of the ideational content in question; it is certainly no evidence of a mental impulse of the dreamer's own.

[73] As regards another writer, Maury, it would almost seem as though he too attributes to the dreaming condition a capacity, not for the arbitrary destruction of mental activity, but for analysing it into its components. He writes as follows of dreams which transgress the bounds of morality: 'Ce sont nos penchants qui parlent et qui nous font agir, sans que la conscience nous retienne, bien que parfois elle nous avertisse. J'ai mes défauts et mes penchants vicieux; à l'état de veille je tâche de lutter contre eux, et il m'arrive assez souvent de n'y pas succomber. Mais dans mes songes j'y succombe toujours ou pour mieux dire j'agis par leur impulsion, sans crainte et sans remords. . . . Evidemment les visions qui se déroulent devant ma pensée et qui constituent le rêve, me sont suggérées par les incitations que je ressens et que ma volonté absente ne cherche pas à refouler.' (Maury, 1878, 113.)[1]

No-one who believes in the capacity of dreams to reveal an immoral tendency of the dreamer's which is really present though suppressed or concealed could express his view more precisely than in Maury's words: 'En rêve l'homme se révèle donc tout entier à soi-même dans sa nudité et sa misère natives. Dès qu'il suspend l'exercice de sa volonté, il devient le jouet de toutes les passions contre lesquelles, à l'état de veille, la conscience, le sentiment de l'honneur, la crainte nous défendent.' (Ibid., 165.)[2] In another passage we find these pertinent sentences: 'Dans le songe, c'est surtout l'homme instinctif qui se révèle. . . . L'homme revient pour ainsi dire à l'état de nature quand il rêve; mais moins les idées acquises ont pénétré dans son esprit, plus les

1 ['It is our impulses that are speaking and making us act, while our conscience does not hold us back, though it sometimes warns us. I have my faults and my vicious impulses; while I am awake I try to resist them, and quite often I succeed in not yielding to them. But in my dreams I *always* yield to them, or rather I act under their pressure without fear or remorse. . . . The visions which unroll before my mind and which constitute a dream are clearly suggested by the urges which I feel and which my absent will does not attempt to repress.']

2 ['Thus in dreams a man stands self-revealed in all his native nakedness and poverty. As soon as he suspends the exercise of his will, he becomes the plaything of all the passions against which he is defended while he is awake by his conscience, his sense of honour and his fears.']

penchants en désaccord avec elles conservent encore sur lui l'influence dans le rêve.' (Ibid., 462.)[1] He goes on to relate by way of example how in his dreams he is not infrequently the victim of the very superstition which he has been attacking in his writings with particular vehemence. [74]

These penetrating reflections of Maury's, however, lose their value in the investigation of dream life owing to the fact that he regards the phenomena which he has observed with such accuracy as no more than proofs of an '*automatisme psychologique*' which, in his view, dominates dreams and which he looks upon as the exact opposite of mental activity.

Stricker (1879, [51]) writes: 'Dreams do not consist solely of illusions. If, for instance, one is afraid of robbers in a dream, the robbers, it is true, are imaginary – but the fear is real.' This calls our attention to the fact that *affects* in dreams cannot be judged in the same way as the remainder of their content; and we are faced with the problem of what part of the psychical processes occurring in dreams is to be regarded as real, that is to say, has a claim to be classed among the psychical processes of waking life.[2]

1 ['What is revealed in dreams is primarily the man of instinct. . . . Man may be said to return in his dreams to a state of nature. But the less his mind has been penetrated by acquired ideas, the more it remains influenced in dreams by impulses of a contrary nature.']

2 [The question of affects in dreams is discussed in Section H of Chapter VI (p. 411 ff. below). The whole topic of moral responsibility for dreams is touched upon below on p. 554 f. and considered at greater length in Section B of Freud (1925*i*), *RSE*, **19**, 115 ff.]

(G)
THEORIES OF DREAMING AND ITS FUNCTION

[75] Any disquisition upon dreams which seeks to explain as many as possible of their observed characteristics from a particular point of view, and which at the same time defines the position occupied by dreams in a wider sphere of phenomena, deserves to be called a theory of dreams. The various theories will be found to differ in that they select one or the other characteristic of dreams as the essential one and take it as the point of departure for their explanations and correlations. It need not necessarily be possible to infer a *function* of dreaming (whether utilitarian or otherwise) from the theory. Nevertheless, since we have a habit of looking for teleological explanations, we shall be more ready to accept theories which are bound up with the attribution of a function to dreaming.

We have already made the acquaintance of several sets of views which deserve more or less to be called theories of dreams in this sense of the term. The belief held in antiquity that dreams were sent by the gods in order to guide the actions of men was a complete theory of dreams, giving information on everything worth knowing about them. Since dreams have become an object of scientific research a considerable number of theories have been developed, including some that are extremely incomplete.

Without attempting any exhaustive enumeration, we may try to divide theories of dreams into the following three rough groups, according to their underlying assumptions as to the amount and nature of psychical activity in dreams.

(1) There are the theories, such as that of Delboeuf [1885, 221 f.], according to which the whole of psychical activity continues in dreams. The mind, they assume, does not sleep and its apparatus remains intact; but, since it falls under the conditions of the state of sleep, which differ from those of waking life, its normal functioning necessarily produces different results during sleep. The question arises in regard to these theories
[76] whether they are capable of deriving all the distinctions between dreams and waking thought from the conditions of the state of sleep. Moreover, there is no possibility of their being able to suggest any *function* for

dreaming; they offer no reason why we should dream, why the complicated mechanism of the mental apparatus should continue to operate even when set in circumstances for which it appears undesigned. Either dreamless sleep or, if disturbing stimuli intervene, awakening would seem to be the only expedient reactions – rather than the third alternative of dreaming.

(2) There are the theories which, on the contrary, presuppose that dreams imply a lowering of psychical activity, a loosening of connections, and an impoverishment of the material accessible. These theories must imply the attribution to sleep of characteristics quite different from those suggested, for instance, by Delboeuf. Sleep, according to such theories, has a far-reaching influence upon the mind; it does not consist merely in the mind being shut off from the external world; it forces its way, rather, into the mental mechanism and throws it temporarily out of use. If I may venture on a simile from the sphere of psychiatry, the first group of theories construct dreams on the model of paranoia, while the second group make them resemble mental deficiency or confusional states [*Amentia*].[1]

The theory according to which only a fragment of mental activity finds expression in dreams, since it has been paralysed by sleep, is by far the most popular with medical writers and in the scientific world generally. Insofar as any general interest may be supposed to exist in the explanation of dreams, this may be described as the ruling theory. It is to be remarked how easily this theory avoids the worst stumbling block in the way of any explanation of dreams – the difficulty of dealing with the contradictions involved in them. It regards dreams as a result of a partial awakening – 'a gradual, partial and at the same time highly abnormal awakening', to quote a remark of Herbart's upon dreams (1892, [307]). Thus, this theory can make use of a series of conditions of ever-increasing wakefulness, culminating in the completely waking state, in order to account for the series of variations in efficiency of mental functioning in dreams, ranging from the inefficiency revealed by their occasional absurdity up to fully concentrated intellectual functioning. [See p. 160 below.]

Those who find that they cannot dispense with a statement in terms of physiology, or to whom a statement in such terms seems more scientific, will find what they want in the account given by Binz (1878, 43): 'This condition' (of torpor) 'comes to an end in the early [77]

1 [Meynert's 'amentia' – an acute hallucinatory psychosis – is discussed in *RSE*, **19**, 142 f.]

hours of the morning, but only by degrees. The products of fatigue which have accumulated in the albumen of the brain gradually diminish; more and more of them are decomposed or eliminated by the unceasing flow of the bloodstream. Here and there separate groups of cells begin to emerge into wakefulness, while the torpid state still persists all around them. The *isolated work of these separate groups* now appears before our clouded consciousness, unchecked by other portions of the brain which govern the process of association. For that reason the images produced, which correspond for the most part to material impressions of the more recent past, are strung together in a wild and irregular manner. The number of the liberated brain cells constantly grows and the senselessness of the dreams correspondingly diminishes.'

This view of dreaming as an incomplete, partial waking state is no doubt to be found in the writings of every modern physiologist and philosopher. The most elaborate exposition of it is given by Maury (1878, 6 f.). It often appears as though that author imagined that the waking or sleeping state could be shifted from one anatomical region to another, each particular anatomical region being linked to one particular psychical function. I will merely remark at this point that, even if the theory of partial waking were confirmed, its details would still remain very much open to discussion.

This view naturally leaves no room for assigning any function to dreaming. The logical conclusion that follows from it as to the position and significance of dreams is correctly stated by Binz (1878, 35): 'Every observed fact forces us to conclude that dreams must be characterized as *somatic* processes, which are in every case useless and in many cases positively pathological. . . .'

The application to dreams of the term 'somatic', which is italicized by Binz himself, has more than one bearing. It alludes, in the first place, to the *aetiology* of dreams which seemed particularly plausible to Binz when he studied the experimental production of dreams by the use of toxic substances. For theories of this kind involve a tendency to limit the instigation of dreams so far as possible to somatic causes. Put in its most extreme form the view is as follows. Once we have put ourselves [78] to sleep by excluding all stimuli, there is no need and no occasion for dreaming until the morning, when the process of being gradually awakened by the impact of fresh stimuli might be reflected in the phenomenon of dreaming. It is impracticable, however, to keep our sleep free from stimuli; they impinge upon the sleeper from all sides – like the germs of

life of which Mephistopheles complained[1] – from without and from within and even from parts of his body which are quite unnoticed in waking life. Thus sleep is disturbed; first one corner of the mind is shaken into wakefulness and then another; the mind functions for a brief moment with its awakened portion and is then glad to fall asleep once more. Dreams are a reaction to the disturbance of sleep brought about by a stimulus – a reaction, incidentally, which is quite superfluous.

But the description of dreaming – which, after all is said and done, remains a function of the mind – as a somatic process implies another meaning as well. It is intended to show that dreams are unworthy to rank as psychical processes. Dreaming has often been compared with 'the ten fingers of a man who knows nothing of music . . . wandering over the keys of a piano' [Strümpell, 1877, 84; cf. p. 197 below]; and this simile shows as well as anything the sort of opinion that is usually held of dreaming by representatives of the exact sciences. On this view a dream is something wholly and completely incapable of interpretation; for how could the ten fingers of an unmusical player produce a piece of music?

Even in the distant past there was no lack of critics of the theory of partial waking. Thus Burdach (1838, 508 f.) wrote: 'When it is said that dreams are a partial waking, in the first place this throws no light either on waking or on sleeping, and in the second place it says no more than that some mental forces are active in dreams while others are at rest. But variability of this kind occurs throughout life.'

This ruling theory, which regards dreams as a somatic process, underlies a most interesting hypothesis put forward for the first time by Robert [79]
in 1886. It is particularly attractive since it is able to suggest a function, a utilitarian purpose, for dreaming. Robert takes as the groundwork of his theory two facts of observation which we have already considered in the course of our examination of the material of dreams (see above, p. 16 ff.), namely that we dream so frequently of the most trivial daily impressions and that we so rarely carry over into our dreams our important daily interests. Robert (1886, 10) asserts that it is universally true that things which we have thoroughly thought out never become instigators of dreams but only things which are in our minds in an uncompleted shape or which have merely been touched upon by our thoughts in

1 [In his first conversation with Faust (Part I, Scene 3), Mephistopheles complained bitterly that his destructive efforts were perpetually frustrated by the emergence of thousands of fresh germs of life. The whole passage is quoted by Freud in a footnote to Chapter VI of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 108 *n.* 3.]

passing: 'The reason why it is usually impossible to explain dreams is precisely because they are caused by sensory impressions of the preceding day which failed to attract enough of the dreamer's attention.' [Ibid., 19–20.] Thus the condition which determines whether an impression shall find its way into a dream is whether the process of working over the impression was interrupted or whether the impression was too unimportant to have a right to be worked over at all.

Robert describes dreams as 'a somatic process of excretion of which we become aware in our mental reaction to it'. [Ibid., 9.] Dreams are excretions of thoughts that have been stifled at birth. 'A man deprived of the capacity for dreaming would in course of time become mentally deranged, because a great mass of uncompleted, unworked-out thoughts and superficial impressions would accumulate in his brain and would be bound by their bulk to smother the thoughts which should be assimilated into his memory as completed wholes.' [Ibid., 10.] Dreams serve as a safety-valve for the overburdened brain. They possess the power to heal and relieve. (Ibid., 32.)

We should be misunderstanding Robert if we were to ask him how it can come about that the mind is relieved through the presentation of ideas in dreams. What Robert is clearly doing is to infer from these two features of the material of dreams that by some means or other an expulsion of worthless impressions is accomplished during sleep as a *somatic* process, and that dreaming is not a special sort of psychical process but merely the information we receive of that expulsion. Moreover, excretion is not the only event which occurs in the mind at night.
[80] Robert himself adds that, besides this, the suggestions arising during the previous day are worked out and that 'whatever parts of the undigested thoughts are not excreted are bound together into a rounded whole by threads of thought borrowed from the imagination and thus inserted in the memory as a harmless imaginative picture.' (Ibid., 23.)

But Robert's theory is diametrically opposed to the ruling one in its estimate of the nature of the *sources* of dreams. According to the latter, there would be no dreaming at all if the mind were not being constantly wakened by external and internal sensory stimuli. But in Robert's view the impulsion to dreaming arises in the mind itself – in the fact of its becoming overloaded and requiring relief [*Entlastung*]^{T}; and he concludes with perfect logic that causes derived from somatic conditions play a subordinate part as determinants of dreams, and that such causes would be quite incapable of provoking dreams in a mind in which there was no material for the construction of dreams derived from

waking consciousness. The only qualification he makes is to admit that the phantasy images arising in dreams out of the depths of the mind may be affected by nervous stimuli. (Ibid., 48.) After all, therefore, Robert does not regard dreams as so completely dependent upon somatic events. Nevertheless, in his view dreams are not psychical processes, they have no place among the psychical processes of waking life; they are somatic processes occurring every night in the apparatus that is concerned with mental activity, and they have as their function the task of protecting that apparatus from excessive tension – or, to change the metaphor – of acting as scavengers of the mind.[1]

Another writer, Yves Delage, bases his theory on the same features of dreams, as revealed in the choice of their material; and it is instructive to notice the way in which a slight variation in his view of the same things leads him to conclusions of a very different bearing.

Delage (1891, [41]) tells us that he experienced in his own person, on the occasion of the death of someone of whom he was fond, the fact that we do *not* dream of what has occupied all our thoughts during the day, or not until it has begun to give place to other daytime concerns. [81]
His investigations among other people confirmed him in the general truth of this fact. He makes what would be an interesting observation of this kind, if it should prove to have general validity, on the dreams of young married couples: 'S'ils ont été fortement épris, presque jamais ils n'ont rêvé l'un de l'autre avant le mariage ou pendant la lune de miel; et s'ils ont rêvé d'amour c'est pour être infidèles avec quelque personne indifférente ou odieuse.'[2] [Ibid., 41.] What, then, do we dream of? Delage identifies the material that occurs in our dreams as consisting of fragments and residues of the preceding days and of earlier times. Everything that appears in our dreams, even though we are inclined at first to regard it as a creation of our dream life, turns out, when we have examined it more closely, to be unrecognized reproduction [of material already experienced] – 'souvenir inconscient'.[3] But this ideational material possesses a common characteristic: it originates from impressions which probably affected our senses more strongly than our intelligence or from which our attention was diverted very soon after

1 [Robert's theory is further discussed on pp. 145 *n.*, 157 f. and 518 below. – In the course of a footnote to *Studies on Hysteria* (Breuer & Freud, 1895*d*), quoted in the Editors' Introduction to this volume, p. xviii above, Freud accepted this theory of Robert's as describing one of the two main factors in the production of dreams.]

2 ['If they were deeply in love, they almost never dreamt of each other before marriage or during their honeymoon; and if they had erotic dreams they were unfaithful in them with some indifferent or repellent person.']

3 ['Unconscious memory.']

they emerged. The less conscious and at the same time the more powerful an impression has been, the more chance it has of playing a part in the next dream.

Here we have what are essentially the same two categories of impressions as are stressed by Robert: the trivial ones and those that have not been dealt with. Delage, however, gives the situation a different turn, for he holds that it is because these impressions have not been dealt with that they are capable of producing dreams, not because they are trivial. It is true in a certain sense that trivial impressions, too, have not been dealt with completely; being in the nature of fresh impressions, they are 'autant de ressorts tendus'[1] which are released during sleep. A powerful impression which happens to have met with some check in the process of being worked over or which has been purposely held under restraint has more claim to play a part in dreams than an impression which is weak and almost unnoticed. The psychical energy which has been stored
[82] up during the daytime by being inhibited and suppressed becomes the driving force for dreams at night. Psychical material that has been suppressed comes to light in dreams. [Ibid., 1891, 43.][2]

At this point, unluckily, Delage interrupts his train of thought. He can attribute only the smallest share in dreams to any independent psychical activity; and thus he brings his theory into line with the ruling theory of the partial awakening of the brain: 'En somme le rêve est le produit de la pensée errante, sans but et sans direction, se fixant successivement sur les souvenirs, qui ont gardé assez d'intensité pour se placer sur sa route et l'arrêter au passage, établissant entre eux un lien tantôt faible et indécis, tantôt plus fort et plus serré, selon que l'activité actuelle du cerveau est plus ou moins abolie par le sommeil.' [Ibid., 46.][3]

(3) We may place in a third group those theories which ascribe to the dreaming mind a capacity and inclination for carrying out special psychical activities of which it is largely or totally incapable in waking

1 [They are 'so many springs under tension'.]

2 [*Footnote added* 1909:] Anatole France expresses exactly the same idea in *Le lys rouge*: 'Ce que nous voyons la nuit, ce sont les restes malheureux de ce que nous avons négligé dans la veille. Le rêve est souvent la revanche des choses qu'on méprise ou le reproche des êtres abandonnés.' ['What we see during the night are the miserable remnants of what we have neglected during the previous day. A dream is often a retaliation on the part of what we despise or a reproach on the part of those we have deserted.']

3 ['In short, dreams are the product of thought wandering without purpose or direction, attaching itself in turn to memories which have retained enough intensity to stand in its way and interrupt its course, and linking them together by a bond which is sometimes weak and vague and sometimes stronger and closer, according as the brain's activity at the moment is abolished by sleep to a greater or lesser extent.']

life. The putting of these faculties into force usually provides dreaming with a utilitarian function. Most of the estimates formed of dreaming by earlier writers on psychology fall into this class. It will be enough, however, for me to quote a sentence from Burdach (1838, 512). Dreaming, he writes, 'is a natural activity of the mind which is not limited by the power of individuality, which is not interrupted by self-consciousness and which is not directed by self-determination, but which is the freely operating vitality of the sensory centres'.

This revelling of the mind in the free use of its own forces is evidently regarded by Burdach and the rest as a condition in which the mind is [83] refreshed and collects new strength for the day's work – in which, in fact, it enjoys a sort of holiday. Thus Burdach [ibid., 514] quotes with approval the charming words in which the poet Novalis praises the reign of dreams: 'Dreams are a shield against the humdrum monotony of life; they set imagination free from its chains so that it may throw into confusion all the pictures of everyday existence and break into the unceasing gravity of grown men with the joyful play of a child. Without dreams we should surely grow sooner old; so we may look on them – not, perhaps, as a gift from on high – but as a precious recreation, as friendly companions on our pilgrimage to the grave.' [*Heinrich von Ofterdingen* (1802), Part I, Chap. 1.]

The reviving and healing function of dreams is described with still more insistence by Purkinje (1846, 456): 'These functions are performed especially by productive dreams. They are the easy play of the imagination and have no connection with the affairs of daytime. The mind has no wish to prolong the tensions of waking life; it seeks to relax them and to recover from them. It produces above all conditions contrary to the waking ones. It cures sorrow by joy, cares by hopes and pictures of happy distraction, hatred by love and friendliness, fear by courage and foresight; it allays doubt by conviction and firm faith, and vain expectation by fulfilment. Many of the spirit's wounds which are being constantly reopened during the day are healed by sleep, which covers them and shields them from fresh injury. The healing action of time is based partly on this.' We all have a feeling that sleep has a beneficial effect upon mental activities, and the obscure working of the popular mind refuses to let itself be robbed of its belief that dreaming is one of the ways in which sleep dispenses its benefits.

The most original and far-reaching attempt to explain dreaming as a special activity of the mind, capable of free expansion only during the

state of sleep, was that undertaken by Scherner in 1861. His book is written in a turgid and high-flown style and is inspired by an almost intoxicated enthusiasm for his subject which is bound to repel anyone who cannot share in his fervour. It puts such difficulties in the way of an analysis of its contents that we turn with relief to the clearer and briefer exposition of Scherner's doctrines given by the philosopher
[84] Volkelt. 'Suggestive gleams of meaning proceed like lightning flashes out of these mystical agglomerations, these clouds of glory and splendour – but they do not illuminate a philosopher's path.' It is in these terms that Scherner's writings are judged even by his disciple. [Volkelt, 1875, 29.]

Scherner is not one of those who believe that the capacities of the mind continue undiminished in dream life. He himself [in Volkelt's words (ibid., 30)] shows how the centralized core of the ego – its spontaneous energy – is deprived of its nervous force in dreams, how as a result of this decentralization the processes of cognition, feeling, willing and ideation are modified, and how the remnants of these psychical functions no longer possess a truly mental character but become nothing more than mechanisms. But by way of contrast, the mental activity which may be described as 'imagination', liberated from the domination of reason and from any moderating control, leaps into a position of unlimited sovereignty. Though dream imagination makes use of recent waking memories for its building material, it erects them into structures bearing not the remotest resemblance to those of waking life; it reveals itself in dreams as possessing not merely reproductive but *productive* powers. [Ibid., 31.] Its characteristics are what lend their peculiar features to dreams. It shows a preference for what is *immoderate, exaggerated* and *monstrous*. But at the same time, being freed from the hindrances of the categories of thought, it gains in pliancy, agility and versatility. It is susceptible in the subtlest manner to the shades of the tender feelings and to passionate emotions, and promptly incorporates our inner life into external plastic pictures. Imagination in dreams is *without the power of conceptual speech*. It is obliged to paint what it has to say pictorially, and, since there are no concepts to exercise an attenuating influence, it makes full and powerful use of the pictorial form. Thus, however clear its speech may be, it is diffuse, clumsy and awkward. The clarity of its speech suffers particularly from the fact that it has a dislike of representing an object by its proper image, and prefers some extraneous image which will express only that particular one of the object's attributes which it is seeking to

represent. Here we have the 'symbolizing activity' of the imagination. . . . [Ibid., 32.] Another very important point is that dream imagination never depicts things completely, but only in outline and even so only in the roughest fashion. For this reason its paintings seem like inspired sketches. It does not halt, however, at the mere representation of an object; it is under an internal necessity to involve the dream ego to a greater or lesser extent with the object and thus produce an *event*. For instance, a dream caused by a visual stimulus may represent gold coins in the street; the dreamer will pick them up delightedly and carry them off. [Ibid., 33.] [85]

The material with which dream imagination accomplishes its artistic work is principally, according to Scherner, provided by the organic somatic stimuli which are so obscure during the daytime. (See above, p. 30 ff.) Thus the excessively fantastic hypothesis put forward by Scherner and the perhaps unduly sober doctrines of Wundt and other physiologists, which are poles asunder in other respects, are entirely at one in regard to their theory of the sources and instigators of dreams. According to the physiological view, however, the mental reaction to the internal somatic stimuli is exhausted with the provoking of certain ideas appropriate to the stimuli; these ideas give rise to others along associative lines and at this point the course of psychical events in dreams seems to be at an end. According to Scherner, on the other hand, the somatic stimuli do no more than provide the mind with material of which it can make use for its imaginative purposes. The formation of dreams only begins, in Scherner's eyes, at the point which the other writers regard as its end.

What dream imagination does to the somatic stimuli cannot, of course, be regarded as serving any useful purpose. It plays about with them, and pictures the organic sources, from which the stimuli of the dream in question have arisen, in some kind of plastic symbolism. Scherner is of the opinion – though here Volkelt [1875, 37] and others refuse to follow him – that dream imagination has one particular favourite way of representing the organism as a whole: namely as a house. Fortunately, however, it does not seem to be restricted to this one method of representation. On the other hand, it may make use of a whole row of houses to indicate a single organ; for instance, a very long street of houses may represent a stimulus from the intestines. Again, separate portions of a house may stand for separate portions of the body; thus, in a dream caused by a headache, the head may be represented by the ceiling of a room covered with disgusting, toadlike spiders. [Ibid., 33 f.]

[86] Leaving this house symbolism on one side, any number of other kinds of things may be used to represent the parts of the body from which the stimulus to the dream has arisen. 'Thus the breathing lung will be symbolically represented by a blazing furnace, with flames roaring with a sound like the passage of air; the heart will be represented by hollow boxes or baskets, the bladder by round, bag-shaped objects or, more generally, by hollow ones. A dream caused by stimuli arising from the male sexual organs may cause the dreamer to find the top part of a clarinet in the street or the mouthpiece of a tobacco pipe, or again, a piece of fur. Here the clarinet and the tobacco pipe represent the approximate shape of the male organ, while the fur stands for the pubic hair. In the case of a sexual dream in a woman, the narrow space where the thighs come together may be represented by a narrow courtyard surrounded by houses, while the vagina may be symbolized by a soft, slippery and very narrow footpath leading across the yard, along which the dreamer has to pass, in order, perhaps, to take a gentleman a letter.' (Ibid., 34.) It is of special importance that, at the end of dreams with a somatic stimulus, such as these, the dream imagination often throws aside its veil, as it were, by openly revealing the organ concerned or its function. Thus a dream 'with a dental stimulus' usually ends by the dreamer picturing himself pulling a tooth out of his mouth. [Ibid., 35.]

Dream imagination may, however, not merely direct its attention to the *form* of the stimulating organ; it may equally well symbolize the substance contained in that organ. In this way, a dream with an intestinal stimulus may lead the dreamer along muddy streets, or one with a urinary stimulus may lead him to a foaming stream. Or the stimulus as such, the nature of the excitement it produces, or the object it desires, may be symbolically represented. Or the dream ego [*Traum-Ich*] may enter into concrete relations with the symbols of its own state; for instance, in the case of painful stimuli the dreamer may engage in a desperate struggle with fierce dogs or savage bulls, or a woman in a sexual dream may find herself pursued by a naked man. [Ibid., 35 f.] Quite apart from the wealth of the means that it employs, the symbolizing activity of the imagination remains the central force in every dream. [Ibid., 36.] The task of penetrating more deeply into the nature of this imagination and of finding a place for it in a system of philosophical thought is attempted by Volkelt
[87] in the pages of his book. But, though it is well and feelingly written, it remains excessively hard to understand for anyone whose early education has not prepared him for a sympathetic grasp of the conceptual constructions of philosophy.

There is no utilitarian function attached to Scherner's symbolizing imagination. The mind plays in its sleep with the stimuli that impinge upon it. One might almost suspect that it plays with them mischievously. But I might also be asked whether my detailed examination of Scherner's theory of dreams can serve any utilitarian purpose, since its arbitrary character and its disobedience to all the rules of research seem only too obvious. By way of rejoinder, I might register a protest against the arrogance which would dismiss Scherner's theory unexamined. His theory is built upon the impression made by his dreams upon a man who considered them with the greatest attention and seems to have had a great personal gift for investigating the obscure things of the mind. Moreover, it deals with a subject that for thousands of years has been regarded by mankind as enigmatic, no doubt, but also as important in itself and its implications – a subject to the elucidation of which exact science, on its own admission, has contributed little apart from an attempt (in direct opposition to popular feeling) to deny it any meaning or significance. And finally, it may honestly be said that in attempting to explain dreams it is not easy to avoid being fantastic. Ganglion cells can be fantastic too. The passage which I quoted on pp. 67–8 from a sober and exact investigator like Binz, and which describes the way in which the dawn of awakening steals over the mass of sleeping cells in the cerebral cortex, is no less fantastic – and no less improbable – than Scherner's attempts at interpretation. I hope to be able to show that behind the latter there is an element of reality, though it has been only vaguely perceived and lacks the attribute of universality which should characterize a theory of dreams. Meanwhile the contrast between Scherner's theory and the medical one will show us the extremes between which explanations of dream life doubtfully oscillate to this very day.[1]

1 [Scherner's theories are further discussed on pp. 199 ff. and 309 f. below.]

(H)
THE RELATIONS BETWEEN DREAMS AND MENTAL DISEASES

[88] When we speak of the relation of dreams to mental disorders we may have three things in mind: (1) aetiological and clinical connections, as when a dream represents a psychotic state, or introduces it, or is left over from it; (2) modifications to which dream life is subject in cases of mental disease; and (3) intrinsic connections between dreams and psychoses, analogies pointing to their being essentially akin. These numerous relations between the two groups of phenomena were a favourite topic among medical writers in earlier times and have become so once again today, as is shown by the bibliographies of the subject collected by Spitta [1882, 196 f. and 319 f.], Radestock [1879, 217], Maury [1878, 124 f.] and Tissié [1898, 77 f.]. Quite recently Sante de Sanctis has turned his attention to this subject.[1] It will be enough for the purpose of my thesis if I do no more than touch upon this important question.

As regards the clinical and aetiological connections between dreams and psychoses, the following observations may be given as samples. Hohnbaum [1830, 124], quoted by Krauss [1858, 619], reports that a first outbreak of delusional insanity [*Wahnsinns*] often originates in an anxious or terrifying dream, and that the dominant idea is connected with the dream. Sante de Sanctis brings forward similar observations in cases of paranoia and declares that in some of these the dream was the 'vraie cause déterminante de la folie'.[2] The psychosis, says de Sanctis, may come to life at a single blow with the appearance of the operative dream which brings the delusional material to light; or it may develop slowly in a series of further dreams, which have still to overcome a certain
[89] amount of doubt. In one of his cases the significant dream was followed by mild hysterical attacks and later by a condition of anxious melancholia. Féré [1886] (quoted by Tissié, 1898, [78]) reports a dream which resulted in a hysterical paralysis. In these instances the dreams are represented as the aetiology of the mental disorder; but we should be doing equal justice to the facts if we said that the mental disorder made its first

1 [*Footnote added* 1914:] Among later writers who deal with these relations are Féré [1887], Ideler [1853], Lasègue [1881], Pichon [1896], Régis [1894], Vespa [1897], Giessler [1888, 1890, 1896], Kazowsky [1901], Pachantoni [1909], etc.

2 ['The true determining cause of insanity.']

appearance in dream life, that it first broke through in a dream. In some further examples the pathological symptoms are contained in dream life, or the psychosis is limited to dream life. Thus Thomayer (1897) draws attention to certain anxiety dreams which he thinks should be regarded as equivalents of epileptic fits. Allison [1868] (quoted by Radestock, 1879, [225]) has described a 'nocturnal insanity', in which the patient appears completely healthy during the day but is regularly subject at night to hallucinations, fits of frenzy, etc. Similar observations are reported by de Sanctis [1899, 226] (a dream of an alcoholic patient which was equivalent to a paranoia, and which represented voices accusing his wife of unfaithfulness) and Tissié. The latter (1898, [147 ff.]) gives copious recent examples in which acts of a pathological nature, such as conduct based on delusional premises and obsessive impulses, were derived from dreams. Guislain [1833] describes a case in which sleep was replaced by an intermittent insanity.

There can be no doubt that alongside of the psychology of dreams physicians will some day have to turn their attention to a *psychopathology* of dreams.

In cases of recovery from mental diseases it can often be quite clearly observed that, while functioning is normal during the day, dream life is still under the influence of the psychosis. According to Krauss (1859, 270), Gregory first drew attention to this fact. Macario [1847], quoted by Tissié [1898, 89], describes how a manic patient, a week after his complete recovery, was still subject in his dreams to the flight of ideas and the violent passions which were characteristic of his illness.

Very little research has hitherto been carried out into the modifications occurring in dream life during chronic psychoses.[1] On the other hand, attention was long ago directed to the underlying kinship between [90] dreams and mental disorders, exhibited in the wide measure of agreement between their manifestations. Maury (1878, 124) tells us that Cabanis (1802) was the first to remark on them, and after him Lélut [1852], J. Moreau (1855) and, in particular, Maine de Biran [1834, 111 ff.] the philosopher. No doubt the comparison goes back still earlier. Radestock (1879, 217) introduces the chapter in which he deals with it by a number of quotations drawing an analogy between dreams and madness. Kant writes somewhere [1764]: 'The madman is a waking dreamer.' Krauss (1859, 270) declares that 'insanity is a dream dreamt while the senses are awake'. Schopenhauer [1851*b*, **1**, 246] calls dreams a

1 [This question was later examined by Freud himself (1922*b*, end of Section B), *RSE*, **18**, 221.]

brief madness and madness a long dream. Hagen [1846, 812] describes delirium as dream life induced not by sleep but by illness. Wundt [1874, 662] writes: 'We ourselves, in fact, can experience in dreams almost all the phenomena to be met with in insane asylums.'

Spitta (1882, 199), in much the same way as Maury (1878), enumerates as follows the different points of agreement which constitute the basis for this comparison: '(1) Self-consciousness is suspended or at least retarded, which results in a lack of insight into the nature of the condition, with consequent inability to feel surprise and loss of moral consciousness. (2) Perception by the sense organs is modified: being diminished in dreams but as a rule greatly increased in insanity. (3) Interconnection of ideas occurs exclusively according to the laws of association and reproduction; ideas thus fall into sequences automatically and there is a consequent lack of proportion in the relation between ideas (exaggerations and illusions). All this leads to (4) an alteration or in some cases a reversal of personality and occasionally of character traits (perverse conduct).'

Radestock (1879, 219) adds a few more features – analogies between the *material* in the two cases: 'The majority of hallucinations and illusions occur in the region of the senses of sight and hearing and of coenaesthesia. As in the case of dreams, the senses of smell and taste provide the fewest elements. – Both in patients suffering from fever and in dreamers memories arise from the remote past; both sleeping and sick men recollect things which waking and healthy men seem to have forgotten.' The analogy between dreams and psychoses is only fully
[91] appreciated when it is seen to extend to the details of expressive movement and to particular characteristics of facial expression.

'A man tormented by physical and mental suffering obtains from dreams what reality denies him: health and happiness. So too in mental disease there are bright pictures of happiness, grandeur, eminence and wealth. The supposed possession of property and the imaginary fulfilment of wishes – the withholding or destruction of which actually affords a psychological basis for insanity – often constitute the chief content of a delirium. A woman who has lost a loved child experiences the joys of motherhood in her delirium; a man who has lost his money believes himself immensely rich; a girl who has been deceived feels that she is tenderly loved.'

(This passage from Radestock is actually a summary of an acute observation made by Griesinger (1862, 106), who shows quite clearly that ideas in dreams and in psychoses have in common the characteristic of

being *fulfilments of wishes*. My own researches have taught me that in this fact lies the key to a psychological theory of both dreams and psychoses.)

'The chief feature of dreams and of insanity lies in their eccentric trains of thought and their weakness of judgement.' In both states [Radestock continues] we find an overvaluation of the subject's own mental achievements which seems senseless to a sober view; the rapid sequence of ideas in dreams is paralleled by the flight of ideas in psychoses. In both there is a complete lack of sense of time. In dreams the personality may be split – when, for instance, the dreamer's own knowledge is divided between two persons and when, in the dream, the extraneous ego corrects the actual one. This is precisely on a par with the splitting of the personality that is familiar to us in hallucinatory paranoia; the dreamer too hears his own thoughts pronounced by extraneous voices. Even chronic delusional ideas have their analogy in stereotyped recurrent pathological dreams (*le rêve obsédant*). – It not infrequently happens that after recovering from a delirium patients will say that the whole period of their illness seems to them like a not unpleasant dream: indeed they will sometimes tell us that even during the illness they have occasionally had a feeling that they are only caught up in a dream – as is often the case in dreams occurring in sleep.

After all this, it is not surprising that Radestock sums up his views, [92]
and those of many others, by declaring that 'insanity, an abnormal pathological phenomenon, is to be regarded as an intensification of the periodically recurrent normal condition of dreaming'. (Ibid., 228.)

Krauss (1859, 270 f.) has sought to establish what is perhaps a still more intimate connection between dreams and insanity than can be demonstrated by an analogy between these external manifestations. This connection he sees in their aetiology or rather in the sources of their excitation. The fundamental element common to the two states lies according to him, as we have seen [p. 33 f. above], in organically determined sensations, in sensations derived from somatic stimuli, in the coenaesthesia which is based upon contributions arising from all the organs. (Cf. Peisse, 1857, **2**, 21, quoted by Maury, 1878, 52.)

The indisputable analogy between dreams and insanity, extending as it does down to their characteristic details, is one of the most powerful props of the medical theory of dream life, which regards dreaming as a useless and disturbing process and as the expression of a reduced

activity of the mind. Nevertheless, it is not to be expected that we shall find the ultimate explanation of dreams in the direction of mental disorders; for the unsatisfactory state of our knowledge of the origin of these latter conditions is generally recognized. It is quite likely, on the contrary, that a modification of our attitude towards dreams will at the same time affect our views upon the internal mechanism of mental disorders and that we shall be working towards an explanation of the psychoses while we are endeavouring to throw some light on the mystery of dreams.[1]

1 [A discussion of the relation between dreams and psychoses can be found in Lecture XXIX of the *New Introductory Lectures* (Freud, 1933*a*), *RSE*, **22**, 14–15.]

POSTSCRIPT, 1909

The fact that I have not extended my account of the literature dealing [93]
with the problems of dreams to cover the period between the first and second editions of this book stands in need of a justification. It may strike the reader as an unsatisfactory one, but for me it was nonetheless decisive. The motives which led me to give any account at all of the way in which earlier writers have dealt with dreams were exhausted with the completion of this introductory chapter; to continue the task would have cost me an extraordinary effort – and the result would have been of very little use or instruction. For the intervening nine years have produced nothing new or valuable either in factual material or in opinions that might throw light on the subject. In the majority of publications that have appeared during the interval my work has remained unmentioned and unconsidered. It has, of course, received least attention from those who are engaged in what is described as 'research' into dreams, and who have thus provided a shining example of the repugnance to learning anything new which is characteristic of men of science. In the ironical words of Anatole France, '*les savants ne sont pas curieux*'. If there were such a thing in science as a right to retaliate, I should certainly be justified in my turn in disregarding the literature that has been issued since the publication of this book. The few notices of it that have appeared in scientific periodicals show so much *lack* of understanding and so much *mis*understanding that my only reply to the critics would be to suggest their reading the book again – or perhaps, indeed, merely to suggest their reading it.

A large number of dreams have been published and analysed in accordance with my directions in papers by physicians who have decided to adopt the psychoanalytic therapeutic procedure, as well as by other authors.[1] Insofar as these writings have gone beyond a mere confirmation of my views I have included their findings in the course of my exposition. I have added a second bibliography at the end of the volume [94]
containing a list of the most important works that have appeared since this book was first published.[2] The extensive monograph on dreams by Sante de Sanctis (1899), of which a German translation appeared soon

1 [In the 1909 and 1911 editions only, there was a parenthesis at this point containing the names of Jung, Abraham, Riklin, Muthmann and Stekel. In 1909 only, the next sentence read: 'But these publications have merely confirmed my views and not added anything to them.']

2 [See the Editors' Introduction, pp. xvii and xxiv above.]

after its issue, was published almost simultaneously with my *Interpretation of Dreams*, so that neither I nor the Italian author was able to comment upon each other's work. I have unfortunately been unable to escape the conclusion that his painstaking volume is totally deficient in ideas – so much so, in fact, that it would not even lead one to suspect the existence of the problems with which I have dealt.

Only two publications need to be mentioned which come near to my own treatment of the problems of dreams. Hermann Swoboda (1904), a youthful philosopher, has undertaken the task of extending to psychical events the discovery of a biological periodicity (in 23-day and 28-day periods) made by Wilhelm Fliess [1906].[1] In the course of his highly imaginative work he has endeavoured to use this key for the solution, among other problems, of the riddle of dreams. His findings would seem to underestimate the significance of dreams; the subject matter of a dream, on his view, is to be explained as an assemblage of all the memories which, on the night on which it is dreamt, complete one of the biological periods, whether for the first or for the *n*th time. A personal communication from the author led me at first to suppose that he himself no longer took this theory seriously, but it seems that this was a mistaken conclusion on my part.[2] At a later stage [see below, p. 147 ff.] I shall report upon some observations which I made in connection with Swoboda's suggestion but which led me to no convincing conclusion. I was the more pleased when, in an unexpected quarter, I made the chance discovery of a view of dreams which coincides entirely with the core of my own theory. It is impossible, for chronological reasons, that the statement in question can have been influenced by my book. I must
[95] therefore hail it as the single discoverable instance in the literature of the subject of an independent thinker who is in agreement with the essence of my theory of dreams. The book which contains the passage upon dreaming which I have in mind appeared in its second edition in 1900 under the title of *Phantasien eines Realisten* by 'Lynkeus'. [First edition, 1899.][3]

1 [An account of Fliess's theories and of his relations with Swoboda is given in Section IV of Kris's introduction to Freud's correspondence with Fliess (Freud, 1950*a*).]

2 [In its present form this sentence dates from 1911. In 1909 it read: 'A personal communication from the author to the effect that he himself no longer supports these views exempts me from giving them serious consideration.' The following sentence was added in 1911.]

3 [*Footnote added* 1930:] Cf. my paper on Josef Popper-Lynkeus and the theory of dreams (1923*f*), *RSE*, **19**, 263 ff. [Freud wrote a further paper on the subject (1932*c*), ibid., **22**, 231 ff. The passage referred to in the text above can be found quoted in full below in a footnote on p. 275 *n.* 2.]

POSTSCRIPT, 1914

The preceding plea of justification was written in 1909. I am bound to admit that since then the situation has changed; my contribution to the interpretation of dreams is no longer neglected by writers on the subject. The new state of affairs, however, has now made it quite out of the question for me to extend my previous account of the literature. *The Interpretation of Dreams* has raised a whole series of fresh considerations and problems which have been discussed in a great variety of ways. I cannot give an account of these works, however, before I have expounded those views of my own on which they are based. I have therefore dealt with whatever seems to me of value in the latest literature at its appropriate place in the course of the discussion which now follows.

II

THE METHOD OF INTERPRETING DREAMS: AN ANALYSIS OF A SPECIMEN DREAM

[96] The title that I have chosen for my work makes plain which of the traditional approaches to the problem of dreams I am inclined to follow. The aim which I have set before myself is to show that dreams are capable of being interpreted [*einer Deutung fähig sind*]; and any contributions I may be able to make towards the solution to the problems dealt with in the last chapter will only arise as by-products in the course of carrying out my proper task. My presumption that dreams can be interpreted at once puts me in opposition to the ruling theory of dreams and in fact to every theory of dreams with the single exception of Scherner's [p. 73 ff. above]; for 'interpreting' a dream implies assigning a 'meaning' [*Sinn*] to it – that is, replacing it with something which fits into the chain of our mental acts as a link having a validity and importance equal to the rest. As we have seen, the scientific theories of dreams leave no room for any problem of interpreting them, since in their view a dream is not a mental act at all, but a somatic process signalizing its occurrence by indications registered in the mental apparatus. Lay opinion has taken a different attitude throughout the ages. It has exercised its indefeasible right to behave inconsistently; and, though admitting that dreams are unintelligible and absurd, it cannot bring itself to declare that they have no significance at all. Led by some obscure feeling, it seems to assume that, in spite of everything, every dream has a meaning, though a hidden one, that dreams are designed to take the place of some other process of thought, and that we have only to undo the substitution correctly in order to arrive at this hidden meaning.

Thus the lay world has from the earliest times concerned itself with 'interpreting' dreams and in its attempts to do so it has made use of two essentially different methods.

The first of these procedures considers the content of the dream as a whole and seeks to replace it with another content which is intelligible
[97] and in certain respects analogous to the original one. This is '*symbolic*' dream interpreting; and it inevitably breaks down when faced with

dreams which are not merely unintelligible but also confused. An example of this procedure is to be seen in the explanation of Pharaoh's dream propounded by Joseph in the Bible. The seven fat kine followed by seven lean kine that ate up the fat kine – all this was a symbolic substitute for a prophecy of seven years of famine in the land of Egypt which should consume all that was brought forth in the seven years of plenty. Most of the artificial dreams constructed by imaginative writers are designed for a symbolic interpretation of this sort: they reproduce the writer's thoughts under a disguise which is regarded as harmonizing with the recognized characteristics of dreams.[1] The idea of dreams being chiefly concerned with the future and being able to foretell it – a remnant of the old prophetic significance of dreams – provides a reason for transposing the meaning of the dream, when it has been arrived at by symbolic interpretation, into the future tense. It is of course impossible to give instructions upon the *method* of arriving at a symbolic interpretation. Success must be a question of hitting on a clever idea, of direct intuition, and for that reason it was possible for dream interpretation by means of symbolism to be exalted into an artistic activity dependent on the possession of peculiar gifts.[2]

The second of the two popular methods of interpreting dreams is far from making any such claims. It might be described as the '*decoding*' method, since it treats dreams as a kind of cryptography in which each sign can be translated into another sign having a known meaning, in accordance with a fixed key. Suppose, for instance, that I have dreamt of a letter and also of a funeral. If I consult a 'dream book', I find that [98]
'letter' must be translated by 'trouble' and 'funeral' by 'betrothal'. It then remains for me to link together the keywords which I have deciphered in this way and, once more, to transpose the result into the future tense. An interesting modification of the process of decoding, which to some extent corrects the purely mechanical character of its method of transposing, is to be found in the book written upon the interpretation of

1 [*Footnote added* 1909:] I found by chance in *Gradiva*, a story written by Wilhelm Jensen, a number of artificial dreams which were perfectly correctly constructed and could be interpreted just as though they had not been invented but had been dreamt by real people. In reply to an enquiry, the author confirmed the fact that he had no knowledge of my theory of dreams. I have argued that the agreement between my researches and this writer's creations is evidence in favour of the correctness of my analysis of dreams. (See Freud, 1907*a*; *RSE*, **9**, 7.)

2 [*Footnote added* 1914:] Aristotle [*De divinatione per somnum*, II (*Trans.*, 1935, 383)] remarked in this connection that the best interpreter of dreams was the man who could best grasp similarities; for dream pictures, like pictures on water, are pulled out of shape by movement, and the most successful interpreter is the man who can detect the truth from the misshapen picture. (Büchsenschütz, 1868, 65.)

dreams [*Oneirocritica*] by Artemidorus of Daldis.[1] This method takes into account not only the content of the dream but also the character and circumstances of the dreamer; so that the same dream element will have a different meaning for a rich man, a married man or, let us say, an orator,
[99] from what it has for a poor man, a bachelor or a merchant. The essence of the decoding procedure, however, lies in the fact that the work of interpretation is not brought to bear on the dream as a whole but on each portion of the dream's content independently, as though the dream were a geological conglomerate in which each fragment of rock required a separate assessment. There can be no question that the invention of the decoding method of interpretation was suggested by disconnected and confused dreams.[2]

1 [*Footnote added* 1914:] Artemidorus of Daldis, who was probably born at the beginning of the second century A.D., has left us the most complete and painstaking study of dream interpretation as practised in the Graeco-Roman world. As Theodor Gomperz (1866, 7 f.) points out, he insisted on the importance of basing the interpretation of dreams on observation and experience, and made a rigid distinction between his own art and others that were illusory. The principle of his interpretative art, according to Gomperz, is identical to magic, the principle of association. A thing in a dream means what it recalls to the mind – to the dream interpreter's mind, it need hardly be said. An insuperable source of arbitrariness and uncertainty arises from the fact that the dream element may recall *various* things to the interpreter's mind and may recall something different to different interpreters. The technique which I describe in the pages that follow differs in one essential respect from the ancient method: it imposes the task of interpretation upon the dreamer himself. It is not concerned with what occurs to the *interpreter* in connection with a particular element of the dream, but with what occurs to the *dreamer*. – Recent reports, however, from a missionary, Father Tfinkdji (1913, [516–17 and 523]), show that modern dream interpreters in the East also make free use of the dreamer's collaboration. He writes as follows of dream interpreters among the Arabs of Mesopotamia: 'Pour interpréter exactement un songe, les oniromanciens les plus habiles s'informent de ceux qui les consultent de toutes les circonstances qu'ils regardent nécessaires pour la bonne explication. . . . En un mot, nos oniromanciens ne laissent aucune circonstance leur échapper et ne donnent l'interprétation désirée avant d'avoir parfaitement saisi et reçu toutes les interrogations désirables.' ['In order to give a precise interpretation of a dream, the most skilful dream diviners find out from those who consult them all the circumstances which they consider essential in order to arrive at a right explanation. . . . In short, these dream diviners do not allow a single point to escape them and only give their interpretation after they have completely mastered the replies to all the necessary enquiries.'] Among these enquiries are habitually included questions as to the dreamer's closest family relations – his parents, wife and children – as well as such a typical formula as: 'Habuistine in hac nocte copulam conjugalem ante vel post somnium?' ['Did you copulate with your wife that night before or after you had the dream?'] – 'L'idée dominante dans l'interprétation des songes consiste á expliquer le rêve par son opposée.' ['The principal idea in interpreting dreams lies in explaining a dream by its opposite.']

2 [*Footnote added* 1909:] Dr Alfred Robitsek has pointed out to me that the oriental 'dream-books' (of which ours are wretched imitations) base the greater number of their interpretations of dream elements upon similarity of sounds and resemblance between words. The fact that these connections inevitably disappear in translation accounts for the unintelligibility of the renderings in our own popular dream books. The extraordinarily important part played by punning and verbal quibbles in the ancient civilizations of the East may be studied in the writings of Hugo Winckler [the famous archaeologist]. – [*Added* 1911:] The nicest instance of a dream interpretation which has reached us from ancient times is based on a play upon words. It is told by Artemidorus [Book IV, Chap. 24; Krauss's translation, 1881, 255]: 'I think too that Aristander gave a most happy interpretation to Alexander of Macedon when he had surrounded Tyre [*Týros*] and was besieging it but was feeling uneasy and disturbed because of the length of time the siege was taking.

It cannot be doubted for a moment that neither of the two popular procedures for interpreting dreams can be employed for a scientific treatment of the subject. The symbolic method is restricted in its application and incapable of being laid down on general lines. In the case of the [100]
decoding method everything depends on the trustworthiness of the 'key', the dream book, and of this we have no guarantee. Thus one might feel tempted to agree with the philosophers and the psychiatrists and, like them, rule out the problem of dream interpretation as a purely fanciful task.[1]

But I have been taught better. I have been driven to realize that here once more we have one of those not infrequent cases in which an ancient and jealously held popular belief seems to be nearer the truth than the judgement of the prevalent science of today. I must affirm that dreams really have a meaning and that a scientific procedure for interpreting them is possible.

My knowledge of that procedure was reached in the following manner. I have been engaged for many years (with a therapeutic aim in view) in unravelling certain psychopathological structures – hysterical phobias, obsessional ideas, and so on. I have been doing so, in fact, ever since I learnt from an important communication by Josef Breuer that as regards these structures (which are looked on as pathological symptoms) unravelling them coincides with removing them.[2] (Cf. Breuer & Freud, 1895*d*.) If a pathological idea of this sort can be traced back to the elements in the patient's mental life from which it originated, it simultaneously crumbles away and the patient is freed from it. Considering the impotence of our other therapeutic efforts and the puzzling nature of these disorders, I felt tempted to follow the path marked out by Breuer, in spite of every difficulty, till a complete explanation was reached. I shall have on another

Alexander dreamt he saw a satyr [*σάτυρος*] dancing on his shield. Aristander happened to be in the neighbourhood of Tyre, in attendance on the king during his Syrian campaign. By dividing the word for satyr into *σά* and *τύρος* he encouraged the king to press home the siege so that he became master of the city.' (*σά Τύρος* = Tyre is thine.) – Indeed, dreams are so closely related to linguistic expression that Ferenczi [1910*a*] has truly remarked that every tongue has its own dream language. It is impossible as a rule to translate a dream into a foreign language and this is equally true, I fancy, of a book such as the present one.[t] [*Added* 1930:] Nevertheless, Dr A. A. Brill of New York, and others after him, have succeeded in translating *The Interpretation of Dreams*.

1 After I had completed my manuscript I came across a work by Stumpf (1899) which agrees with my views in seeking to prove that dreams have a meaning and can be interpreted. He effects his interpretations, however, by means of a symbolism of an allegorical character without any guarantee of the general validity of his procedure. [In the 1900 edition only, this footnote occurred in the position now occupied by footnote 2, p. 87 above.]

2 ['*Auflösung*' and '*Lösung*' in the original.]

occasion to report at length upon the form finally taken by this procedure and the results of my labours. It was in the course of these psychoanalytic studies that I came upon dream interpretation. My patients were pledged to communicate to me every idea or thought that occurred to them in connection with some particular subject; among other things they told me their dreams and so taught me that a dream can [101] be inserted into the psychical chain that has to be traced backwards in the memory from a pathological idea. It was then only a short step to treating the dream itself as a symptom and to applying to dreams the method of interpretation that had been worked out for symptoms.

This involves some psychological preparation of the patient. We must aim at bringing about two changes in him: an increase in the attention he pays to his own psychical perceptions and the elimination of the criticism by which he normally sifts the thoughts that occur to him. In order that he may be able to concentrate his attention on his self-observation it is an advantage for him to lie in a restful attitude and shut his eyes.[1] It is necessary to insist explicitly on his renouncing all criticism of the thoughts that he perceives. We therefore tell him that the success of the psychoanalysis depends on his noticing and reporting whatever comes into his head and not being misled, for instance, into suppressing an idea because it strikes him as unimportant or irrelevant or because it seems to him meaningless. He must adopt a completely impartial attitude to what occurs to him, since it is precisely his critical attitude which is responsible for his being unable, in the ordinary course of things, to achieve the desired unravelling of his dream or obsessional idea or whatever it may be.

I have noticed in my psychoanalytical work that the whole frame of mind of a man who is reflecting is totally different from that of a man who is observing his own psychical processes. In reflection there is one more psychical activity at work than in the most attentive self-observation, and this is shown among other things by the tense looks and wrinkled forehead of a person pursuing his reflections as compared with the restful expression of a self-observer. In both cases attention[2] must be concentrated, but the man who is reflecting is also exercising his *critical* faculty; this leads him to reject some of the ideas that occur to him after perceiving them, to cut short others without following the

1 [The stress upon the advisability of shutting the eyes (a remnant of the old hypnotic procedure) was very soon dropped. See, for instance, the account of psychoanalytic technique in Freud (1904*a*), *RSE*, 7, 224, where it is specifically mentioned that the analyst does *not* ask the patient to shut his eyes.]

2 [The function of attention is discussed below (p. 530 f.).]

trains of thought which they would open up to him, and to behave in [102]
such a way towards still others that they never become conscious at all and are accordingly suppressed before being perceived. The self-observer, on the other hand, need only take the trouble to suppress his critical faculty. If he succeeds in doing that, innumerable ideas come into his consciousness of which he could otherwise never have got hold. The material which is in this way freshly obtained for his self-perception makes it possible to interpret both his pathological ideas and his dream structures. What is in question, evidently, is the establishment of a psychical state which, in its distribution of psychical energy (that is, of mobile attention), bears some analogy to the state before falling asleep – and no doubt also to hypnosis. As we fall asleep, 'involuntary ideas' emerge, owing to the relaxation of a certain deliberate (and no doubt also critical) activity which we allow to influence the course of our ideas while we are awake. (We usually attribute this relaxation to 'fatigue'.) As the involuntary ideas emerge they change into visual and acoustic images. (Cf. the remarks by Schleiermacher and others quoted above on pp. 44 f. [and 63 f.].)[1] In the state used for the analysis of dreams and pathological ideas, the patient purposely and deliberately abandons this activity and employs the psychical energy thus saved (or a portion of it) in attentively following the involuntary thoughts which now emerge, and which – and here the situation differs from that of falling asleep – retain the character of ideas. *In this way the 'involuntary' ideas are transformed into 'voluntary' ones*.

The adoption[2] of the required attitude of mind towards ideas that seem to emerge 'of their own free will' [*'freisteigende' Einfalle*][T] and the *Einfall*
abandonment of the critical function that is normally in operation against them seem to be hard of achievement for some people. The 'involuntary thoughts' are liable to release a most violent resistance, which seeks to prevent their emergence. If we may trust that great poet and philosopher Friedrich Schiller, however, poetic creation must demand a very similar attitude. In a passage in his correspondence with Körner – we have to thank Otto Rank for unearthing it – Schiller (writing [103]
on December 1, 1788) replies to his friend's complaint of insufficient productivity: 'The ground for your complaint seems to me to lie in the constraint imposed by your reason upon your imagination. I will make

1 [*Footnote added* 1919:] Silberer (1909, 1910 and 1912) has made important contributions to dream interpretation by directly observing this transformation of ideas into visual images. [See below, pp. 308 f. and 450 f.]

2 [This paragraph was added in 1909, and the first sentence of the next paragraph modified accordingly.]

my idea more concrete by a simile. It seems a bad thing and detrimental to the creative work of the mind if Reason makes too close an examination of the ideas as they come pouring in – at the very gateway, as it were. Looked at in isolation, a thought may seem very trivial or very fantastic; but it may be made important by another thought that comes after it, and, in conjunction with other thoughts that may seem equally absurd, it may turn out to form a most effective link. Reason cannot form any opinion upon all this unless it retains the thought long enough to look at it in connection with the others. On the other hand, where there is a creative mind, Reason – so it seems to me – relaxes its watch upon the gates, and the ideas rush in pell-mell, and only then does it look them through and examine them in a mass. – You critics, or whatever else you may call yourselves, are ashamed or frightened of the momentary and transient extravagances which are to be found in all truly creative minds and whose longer or shorter duration distinguishes the thinking artist from the dreamer. You complain of your unfruitfulness because you reject too soon and discriminate too severely.'

Nevertheless, what Schiller describes as a relaxation of the watch upon the gates of Reason, the adoption of an attitude of uncritical self-observation, is by no means difficult. Most of my patients achieve it after their first instructions. I myself can do so very completely, by the help of writing down my ideas as they occur to me. The amount of psychical energy by which it is possible to reduce critical activity and increase the intensity of self-observation varies considerably according to the subject on which one is trying to fix one's attention.

Our first step in the employment of this procedure teaches us that what we must take as the object of our attention is not the dream as a whole but the separate portions of its content. If I say to a patient who is still a novice: 'What occurs to you in connection with this dream?', as a rule his mental horizon becomes a blank. If, however, I put the dream before him cut up into pieces, he will give me a series of associations to each piece, which
[104] might be described as the 'background thoughts' of that particular part of the dream. Thus the method of dream interpretation which I practise already differs in this first important respect from the popular, historic and legendary method of interpretation by means of symbolism and approximates to the second or 'decoding' method. Like the latter, it employs interpretation *en détail* and not *en masse*; like the latter, it regards dreams from the very first as being of a composite character, as being conglomerates of psychical formations. [Cf. pp. 374 f. and 401 below.][1]

1 [The technique of dream interpretation is further discussed below (p. 467 ff.). See also the first two sections of Freud (1923*c*), *RSE*, **19**, 115 ff. The quite other question of the part played by dream interpretation in the technique of therapeutic psychoanalysis is considered in Freud (1911*e*), ibid., **12**, 83 ff.]

In the course of my psychoanalyses of neurotics I must already have analysed over a thousand dreams; but I do not propose to make use of this material in my present introduction to the technique and theory of dream interpretation. Apart from the fact that such a course would be open to the objection that these are the dreams of neuropaths, from which no valid inferences could be made as to the dreams of normal people, there is quite another reason which forces this decision upon me. The subject to which these dreams of my patients lead up is always, of course, the case history which underlies their neurosis. Each dream would therefore necessitate a lengthy introduction and an investigation of the nature and aetiological determinants of the psychoneuroses. But these questions are in themselves novelties and highly bewildering and would distract attention from the problem of dreams. On the contrary, it is my intention to make use of my present elucidation of dreams as a preliminary step towards solving the more difficult problems of the psychology of the neuroses.[1] If, however, I forgo my principal material, the dreams of my neurotic patients, I must not be too particular about what is left to me. All that remains are such dreams as have been reported to me from time to time by normal persons of my acquaintance, and such [105]
others as have been quoted as instances in the literature dealing with dream life. Unluckily, however, none of these dreams is accompanied by the analysis without which I cannot discover a dream's meaning. My procedure is not so convenient as the popular decoding method which translates any given piece of a dream's content by a fixed key. I, on the contrary, am prepared to find that the same piece of content may conceal a different meaning when it occurs in various people or in various contexts. Thus it comes about that I am led to my own dreams, which offer a copious and convenient material, derived from an approximately normal person and relating to multifarious occasions of daily life. No doubt I shall be met with doubts of the trustworthiness of 'self-analyses' of this kind; and I shall be told that they leave the door open to arbitrary conclusions. In my judgement the situation is in fact more favourable in the case of *self*-observation than in that of other people; at all events we may make the experiment and see how far self-analysis takes us with the interpretation of dreams. But I have other difficulties to overcome, which lie within myself. There is some natural hesitation about revealing so many intimate facts about one's mental life; nor can there be any

1 [At the beginning of Section E of Chapter VII, Freud reflects upon the difficulties imposed upon his exposition of the subject by this programme, which is already laid down in his Preface to the first edition (p. xxvii above). As he points out on p. 129 and again on p. 133 f. *n.* below, he is often led into disregarding it. In spite of his declared intention, he makes use of many of his patients' dreams, and more than once (e.g. on p. 132 f. below) enters into a discussion of the mechanism of neurotic symptoms.]

guarantee against misinterpretation by strangers. But it must be possible to overcome such hesitations. 'Tout psychologiste', writes Delboeuf [1885, 30], 'est obligé de faire l'aveu même de ses faiblesses s'il croit par là jeter du jour sur quelque problème obscur.'[1] And it is safe to assume that my readers too will very soon find their initial interest in the indiscretions which I am bound to make replaced with an absorbing immersion in the psychological problems upon which they throw light.[2]

Accordingly I shall proceed to choose one of my own dreams and demonstrate upon it my method of interpretation. In the case of every such dream some remarks by way of preamble will be necessary. – And
[106] now I must ask the reader to make my interests his own for quite a while, and to plunge, along with me, into the minutest details of my life; for a transference of this kind is peremptorily demanded by our interest in the hidden meaning of dreams.

PREAMBLE

During the summer of 1895 I had been giving psychoanalytic treatment to a young lady who was on very friendly terms with me and my family. It will be readily understood that a mixed relationship such as this may be a source of many disturbed feelings in a physician and particularly in a psychotherapist. While the physician's personal interest is greater, his authority is less; any failure would bring a threat to the old-established friendship with the patient's family. This treatment had ended in a partial success; the patient was relieved of her hysterical anxiety but did not lose all her somatic symptoms. At that time I was not yet quite clear in my mind as to the criteria indicating that a hysterical case history was finally closed, and I proposed a solution to the patient which she seemed unwilling to accept. While we were thus at variance, we had broken off the treatment for the summer vacation. – One day I had a visit from a junior colleague, one of my oldest friends, who had been staying with my patient, Irma, and her family at their country resort. I asked him how he had found her and he answered: 'She's better, but not quite well.' I was conscious that my friend Otto's words, or the tone in which he spoke them, annoyed me. I fancied I detected a reproof in them, such as to the

1 ['Every psychologist is under an obligation to confess even his own weaknesses, if he thinks that it may throw light upon some obscure problem.']

2 I am obliged to add, however, by way of qualification of what I have said above, that in scarcely any instance have I brought forward the *complete* interpretation of one of my own dreams, as it is known to me. I have probably been wise in not putting too much faith in my readers' discretion.

effect that I had promised the patient too much; and, whether rightly or wrongly, I attributed the supposed fact of Otto's siding against me to the influence of my patient's relatives, who, as it seemed to me, had never looked with favour on the treatment. However, my disagreeable impression was not clear to me and I gave no outward sign of it. The same evening I wrote out Irma's case history, with the idea of giving it to Dr M. (a mutual friend who was at that time the leading figure in our circle) in order to justify myself. That night (or more probably the next morning) I had the following dream, which I noted down immediately after waking.[1]

DREAM OF JULY 23–24, 1895[t]

A large hall – numerous guests, whom we were receiving. – Among them [107]
was Irma. I at once took her on one side, as though to answer her letter and to reproach her for not having accepted my 'solution' yet. I said to her: 'If you still get pains, it's really only your fault.' She replied: 'If you only knew what pains I've got now in my throat and stomach and abdomen – it's choking me' – I was alarmed and looked at her. She looked pale and puffy. I thought to myself that after all I must be missing some organic trouble. I took her to the window and looked down her throat, and she showed signs of recalcitrance, like women with artificial dentures. I thought to myself that there was really no need for her to do that. – She then opened her mouth properly and on the right I found a big white[2] *patch; at another place I saw extensive whitish grey scabs upon some remarkable curly structures which were evidently modelled on the turbinal bones of the nose. – I at once called in Dr M., and he repeated the examination and confirmed it. . . . Dr M. looked quite different from usual; he was very pale, he walked with a limp and his chin was clean-shaven. . . . My friend Otto was now standing beside her as well, and my friend Leopold was percussing her through her bodice and saying: 'She has a dull area low down on the left.' He also indicated that a portion of the skin on the left shoulder was infiltrated. (I noticed this, just as he did, in spite of her dress.) . . . M. said: 'There's no doubt it's an infection, but no matter; dysentery will supervene and the toxin will be eliminated.' . . . We*

1 [*Footnote added* 1914:] This is the first dream which I submitted to a detailed interpretation. [Freud describes some first groping attempts at the analysis of his own dreams in *Studies on Hysteria* (Breuer & Freud, 1895*d*). They can be found mentioned in the course of the long footnote attached to the entry of May 15 in the case history of Frau Emmy von N. This passage is quoted in full in the Editors' Introduction (p. xviii above).]

2 [The word 'white' is omitted, no doubt accidentally, in the 1942 edition only.]

were directly aware, too, of the origin of the infection. Not long before, when she was feeling unwell, my friend Otto had given her an injection of a preparation of propyl, propyls . . . propionic acid . . . trimethylamine (and I saw before me the formula for this printed in heavy type). . . . Injections of that sort ought not to be made so thoughtlessly. . . . And probably the syringe had not been clean.[1]

This dream has one advantage over many others. It was immediately clear what events of the previous day provided its starting point. My preamble makes that plain. The news which Otto had given me of Irma's
[108] condition and the case history which I had been engaged in writing till far into the night continued to occupy my mental activity even after I was asleep. Nevertheless, no-one who had only read the preamble and the content of the dream itself could have the slightest notion of what the dream meant. I myself had no notion. I was astonished at the symptoms of which Irma complained to me in the dream, since they were not the same as those for which I had treated her. I smiled at the senseless idea of an injection of propionic acid and at Dr M.'s consoling reflections. Towards its end the dream seemed to me to be more obscure and compressed than it was at the beginning. In order to discover the meaning of all this it was necessary to undertake a detailed analysis.

ANALYSIS

The hall – numerous guests, whom we were receiving. We were spending that summer at Bellevue, a house standing by itself on one of the hills adjoining the Kahlenberg.[2] The house had formerly been designed as a place of entertainment and its reception rooms were in consequence unusually lofty and hall-like. It was at Bellevue that I had the dream, a few days before my wife's birthday. On the previous day my wife had told me that she expected that a number of friends, including Irma, would be coming out to visit us on her birthday. My dream was thus anticipating this occasion: it was my wife's birthday and a number of guests, including Irma, were being received by us in the large hall at Bellevue.

I reproached Irma for not having accepted my solution; I said: 'If you still get pains, it's your own fault.' I might have said this to her in waking

1 [We owe to Philip Slotkin the observation that 'trimethylamine' was spelt in the German fashion throughout the *SE*.]

2 [A hill which is a favourite resort in the immediate neighbourhood of Vienna.]

life, and I may actually have done so. It was my view at that time (though I have since recognized it as a wrong one) that my task was fulfilled when I had informed a patient of the hidden meaning of his symptoms: I considered that I was not responsible for whether or not he accepted the solution – though this was what success depended on. I owe it to this mistake, which I have now fortunately corrected, that my life was made easier at a time when, in spite of all my inevitable ignorance, I was expected to produce therapeutic successes. – I noticed, however, that the words which I spoke to Irma in the dream showed that I was specially anxious not to be responsible for the pains which she still had. If they were her fault they could not be mine. Could it be that the purpose of the dream lay in this direction? [109]

Irma's complaint: pains in her throat and abdomen and stomach; it was choking her. Pains in the stomach were among my patient's symptoms but were not very prominent; she complained more of feelings of nausea and disgust. Pains in the throat and abdomen and constriction of the throat played scarcely any part in her illness. I wondered why I decided upon this choice of symptoms in the dream but could not think of an explanation at the moment.

She looked pale and puffy. My patient always had a rosy complexion. I began to suspect that someone else was being substituted for her.

I was alarmed at the idea that I had missed an organic illness. This, as may well be believed, is a perpetual source of anxiety to a specialist whose practice is almost limited to neurotic patients and who is in the habit of attributing to hysteria a great number of symptoms which other physicians treat as organic. On the other hand, a faint doubt crept into my mind – from where, I could not tell – that my alarm was not entirely genuine. If Irma's pains had an organic basis, once again I could not be held responsible for curing them; my treatment only set out to get rid of *hysterical* pains. It occurred to me, in fact, that I was actually *wishing* that there had been a wrong diagnosis; for, if so, the blame for my lack of success would also have been got rid of.

I took her to the window and looked down her throat, and she showed some signs of recalcitrance, like women with artificial dentures. I thought to myself that really there was no need for her to do that. I had never had any occasion to examine Irma's oral cavity. What happened in the dream reminded me of an examination I had carried out some time before of a governess: at first glance she had seemed a picture of youthful beauty, but when it came to opening her mouth she had taken measures to conceal her plates. This led to recollections of other medical examinations

and of little secrets revealed in the course of them – to the satisfaction of neither party. '*There was really no need for her to do that*' was no doubt intended in the first place as a compliment to Irma; but I suspected that it had another meaning besides. (If one carries out an analysis attentively, one gets a feeling of whether or not one has exhausted all the back-
[110] ground thoughts that are to be expected.) The way in which Irma stood by the window suddenly reminded me of another experience. Irma had an intimate woman friend of whom I had a very high opinion. When I visited this lady one evening I had found her by a window in the situation reproduced in the dream, and her physician, the same Dr M., had pronounced that she had a diphtheritic membrane. The figure of Dr M. and the membrane reappear later in the dream. It now occurred to me that for the last few months I had had every reason to suppose that this other lady was also a hysteric. Indeed, Irma herself had betrayed the fact to me. What did I know of her condition? One thing precisely: that, like my Irma of the dream, she suffered from hysterical choking. So in the dream I had replaced my patient with her friend. I now recollected that I had often played with the idea that she too might ask me to relieve her of her symptoms. I myself, however, had thought this unlikely, since she was of a very reserved nature. She was *recalcitrant*, as was shown in the dream. Another reason was that *there was no need for her to do it*: she had so far shown herself strong enough to master her condition without outside help. There still remained a few features that I could not attach either to Irma or to her friend: *pale; puffy; false teeth*. The false teeth took me to the governess whom I have already mentioned; I now felt inclined to be satisfied with *bad* teeth. I then thought of someone else to whom these features might be alluding. She again was not one of my patients, nor should I have liked to have her as a patient, since I had noticed that she was bashful in my presence and I could not think she would make an amenable patient. She was usually pale, and once, while she had been in specially good health, she had looked puffy.[1] Thus I had been comparing my patient Irma with two other people who would also have been recalcitrant to treatment. What could the reason have been for my having exchanged her in the dream for her friend? Perhaps it was that I should have *liked* to exchange her: either I felt more sympathetic
[111] towards her friend or had a higher opinion of her intelligence. For Irma

1 The still unexplained complaint about *pains in the abdomen* could also be traced back to this third figure. The person in question was, of course, my own wife; the pains in the abdomen reminded me of one of the occasions on which I had noticed her bashfulness. I was forced to admit to myself that I was not treating either Irma or my wife very kindly in this dream; but it should be observed by way of excuse that I was measuring them both by the standard of the good and amenable patient.

seemed to me foolish because she had not accepted my solution. Her friend would have been wiser, that is to say she would have yielded sooner. She would then have *opened her mouth properly*, and have told me more than Irma.[1]

What I saw in her throat: a white patch and turbinal bones with scabs on them. The white patch reminded me of diphtheritis and so of Irma's friend, but also of a serious illness of my eldest daughter's almost two years earlier and of the fright I had had in those anxious days. The scabs on the turbinal bones recalled a worry about my own state of health. I was making frequent use of cocaine at that time to reduce some troublesome nasal swellings, and I had heard a few days earlier that one of my women patients who had followed my example had developed an extensive necrosis of the nasal mucous membrane. I had been the first to recommend the use of cocaine, in 1885,[2] and this recommendation had brought serious reproaches down on me. The misuse of that drug had hastened the death of a dear friend of mine. This had been before 1895 [the date of the dream].

I at once called in Dr M., and he repeated the examination. This simply corresponded to the position occupied by M. in our circle. But the '*at once*' was sufficiently striking to require a special explanation.[3] It reminded me of a tragic event in my practice. I had on one occasion produced a severe toxic state in a woman patient by repeatedly prescribing what was at that time regarded as a harmless remedy (sulphonal), and had hurriedly turned for assistance and support to my experienced senior colleague. There was a subsidiary detail which confirmed the idea that I had this incident in mind. My patient – who succumbed to the poison – had the same name as my eldest daughter. It [112] had never occurred to me before, but it struck me now almost like an act of retribution on the part of destiny. It was as though the replacement of one person with another was to be continued in another sense: this Mathilde for that Mathilde, an eye for an eye and a tooth for a tooth. It

1 I had a feeling that the interpretation of this part of the dream was not carried far enough to make it possible to follow the whole of its concealed meaning. If I had pursued my comparison between the three women, it would have taken me far afield. – There is at least one spot in every dream at which it is unplumbable – a navel, as it were, that is its point of contact with the unknown. [Cf. p. 469 below.]

2 [This is a misprint (which occurs in every German edition) for '1884', the date of Freud's first paper on cocaine. A full account of Freud's work in connection with cocaine can be found in Chapter VI of the first volume of Ernest Jones's life of Freud (1953). From this it appears that the 'dear friend' was Fleischl von Marxow (see p. 431 *n.* 1 below). Further indirect allusions to this episode can be found on pp. 150 f., 182 f., 192 and 432 f. below.]

3 [See below, p. 459.]

seemed as if I had been collecting all the occasions which I could bring up against myself as evidence of lack of medical conscientiousness.[1]

Dr M. was pale, had a clean-shaven chin and walked with a limp. This was true to the extent that his unhealthy appearance often caused his friends anxiety. The two other features could only apply to someone else. I thought of my elder brother, who lives abroad, who is clean-shaven and whom, if I remembered right, the M. of the dream closely resembled. We had had news a few days earlier that he was walking with a limp owing to an arthritic affection of his hip. There must, I reflected, have been some reason for my fusing into one the two figures in the dream. I then remembered that I had a similar reason for being in an ill-humour with each of them: they had both rejected a certain suggestion I had recently laid before them.

My friend Otto was now standing beside the patient and my friend Leopold was examining her and indicated that there was a dull area low down on the left. My friend Leopold was also a physician and a relative of Otto's. Since they both specialized in the same branch of medicine, it was their fate to be in competition with each other, and comparisons were constantly being drawn between them. Both of them acted as my assistants for years while I was still in charge of the neurological out-patients' department of a children's hospital.[2] Scenes such as the one represented in the dream used often to occur there. While I was discussing the diagnosis of a case with Otto, Leopold would be examining the child once more and would make an unexpected contribution to our decision. The difference between their characters was like that between the bailiff Bräsig and his friend Karl[3]: one was distinguished for his quickness, while the other was slow but sure. If in the dream I was contrasting Otto with the prudent Leopold, I was evidently doing so to the
[113] advantage of the latter. The comparison was similar to the one between my disobedient patient Irma and the friend whom I regarded as wiser than she was. I now perceived another of the lines along which the chain of thought in the dream branched off: from the sick child to the children's hospital. – *The dull area low down on the left* seemed to me to agree in every detail with one particular case in which Leopold had

1 [Freud's treatment of the case of 'Mathilde' is described in detail, with original documents, by Hirschmüller (1989).]

2 [For details of this hospital, the Kassowitz Institute, see Section II of Kris's introduction to the Fliess correspondence (Freud, 1950*a*).]

3 [The two chief figures in the once popular novel *Ut mine Stromtid*, written in Mecklenburg dialect, by Fritz Reuter (1862–4). There is an English translation, *An Old Story of my Farming Days* (London, 1878).]

struck me by his thoroughness. I also had a vague notion of something in the nature of a metastatic affection; but this may also have been a reference to the patient whom I should have liked to have in the place of Irma. So far as I had been able to judge, she had produced an imitation of a tuberculosis.

A portion of the skin on the left shoulder was infiltrated. I saw at once that this was the rheumatism in my own shoulder, which I invariably notice if I sit up late into the night. Moreover, the wording in the dream was most ambiguous: '*I noticed this, just as he did. . . .*' I noticed it in my own body, that is. I was struck, too, by the unusual phrasing: 'a portion of the skin was infiltrated'. We are in the habit of speaking of 'a left upper posterior infiltration', and this would refer to the lung and so once more to tuberculosis.

In spite of her dress. This was in any case only an interpolation. We naturally used to examine the children in the hospital undressed: and this would be a contrast to the manner in which adult female patients have to be examined. I remembered that it was said of a celebrated clinician that he never made a physical examination of his patients except through their clothes. Further than this I could not see. Frankly, I had no desire to penetrate more deeply at this point.

Dr M. said: 'It's an infection, but no matter. Dysentery will supervene and the toxin will be eliminated.' At first this struck me as ridiculous. But nevertheless, like all the rest, it had to be carefully analysed. When I came to look at it more closely it seemed to have some sort of meaning all the same. What I discovered in the patient was a local diphtheritis. I remembered from the time of my daughter's illness a discussion on diphtheritis and diphtheria, the latter being the general infection that arises from the local diphtheritis. Leopold indicated the presence of a general infection of this kind from the existence of a dull area, which might thus be regarded as a metastatic focus. I seemed to think, it is true, that metastases like this do not, in fact, occur with diphtheria: it made me think [114] rather of pyaemia.

No matter. This was intended as a consolation. It seemed to fit into the context as follows. The content of the preceding part of the dream had been that my patient's pains were due to a severe organic affection. I had a feeling that I was only trying in that way to shift the blame from myself. Psychological treatment could not be held responsible for the persistence of diphtheritic pains. Nevertheless, I had a sense of awkwardness at having invented such a severe illness for Irma simply in order to clear myself. It looked so cruel. Thus I was in need of an assurance that all would be

well in the end, and it seemed to me that to have put the consolation into the mouth precisely of Dr M. had not been a bad choice. But here I was taking up a superior attitude towards the dream, and this itself required explanation.

And why was the consolation so nonsensical?

Dysentery. There seemed to be some remote theoretical notion that morbid matter can be eliminated through the bowels. Could it be that I was trying to make fun of Dr M.'s fertility in producing far-fetched explanations and making unexpected pathological connections? Something else now occurred to me in relation to dysentery. A few months earlier I had taken on the case of a young man with remarkable difficulties associated with defaecating, who had been treated by other physicians as a case of 'anaemia accompanied by malnutrition'. I had recognized it as a hysteria, but had been unwilling to try him with my psychotherapeutic treatment and had sent him on a sea voyage. Some days before, I had had a despairing letter from him from Egypt, saying that he had had a fresh attack there which a doctor had declared was dysentery. I suspected that the diagnosis was an error on the part of an ignorant practitioner who had allowed himself to be taken in by the hysteria. But I could not help reproaching myself for having put my patient in a situation in which he might have contracted some organic trouble on top of his hysterical intestinal disorder. Moreover, 'dysentery' sounds not unlike 'diphtheria' – a word of ill omen which did not occur in the dream.[1]

[115] Yes, I thought to myself, I must have been making fun of Dr M. with the consoling prognosis 'Dysentery will supervene, etc.': for it came back to me that, years before, he himself had told an amusing story of a similar kind about another doctor. Dr M. had been called in by him for consultation over a patient who was seriously ill, and had felt obliged to point out, in view of the very optimistic view taken by his colleague, that he had found albumen in the patient's urine. The other, however, was not in the least put out: '*No matter*', he had said, 'the albumen will soon be eliminated!' – I could no longer feel any doubt, therefore, that this part of the dream was expressing derision at physicians who are ignorant of hysteria. And, as though to confirm this, a further idea crossed my mind: 'Does Dr M. realize that the symptoms in his patient (Irma's friend) which give grounds for fearing tuberculosis also have a hysterical basis? Has he spotted this hysteria? or has he been taken in by it?'

But what could be my motive for treating this friend of mine so badly? That was a very simple matter. Dr M. was just as little in agreement with

1 [The German words '*Dysenterie*' and '*Diphtherie*' are more alike than the English ones.]

my 'solution' as Irma herself. So I had already revenged myself in this dream on two people: on Irma with the words 'If you still get pains, it's your own fault', and on Dr M. by the wording of the nonsensical consolation that I put into his mouth.

We were directly aware of the origin of the infection. This direct knowledge in the dream was remarkable. Only just before we had had no knowledge of it, for the infection was only revealed by Leopold.

When she was feeling unwell, my friend Otto had given her an injection. Otto had, in fact, told me that during his short stay with Irma's family he had been called in to a neighbouring hotel to give an injection to someone who had suddenly felt unwell. These injections reminded me once more of my unfortunate friend who had poisoned himself with cocaine [see p. 99 *n.* 2 above]. I had advised him to use the drug internally [i.e. orally] only, while morphia was being withdrawn; but he had at once given himself cocaine *injections*.

A preparation of propyl . . . propyls . . . propionic acid. How could I have come to think of this? During the previous evening, before I wrote out the case history and had the dream, my wife had opened a bottle of liqueur, on which the word 'Ananas'[1] appeared and which was a gift from [116]
our friend Otto: for he has a habit of making presents on every possible occasion. It was to be hoped, I thought to myself, that some day he would find a wife to cure him of the habit.[2] This liqueur gave off such a strong smell of fusel oil that I refused to touch it. My wife suggested our giving the bottle to the servants, but I – with even greater prudence – vetoed the suggestion, adding in a philanthropic spirit that there was no need for *them* to be poisoned either. The smell of fusel oil (amyl . . .) evidently stirred up in my mind a recollection of the whole series – propyl, methyl, and so on – and this accounted for the propyl preparation in the dream. It is true that I carried out a substitution in the process: I dreamt of propyl after having smelt amyl. But substitutions of this kind are perhaps legitimate in organic chemistry.

Trimethylamine. I saw the chemical formula of this substance in my dream, which bears witness to a great effort on the part of my memory. Moreover, the formula was printed in heavy type, as though there had been a desire to lay emphasis on some part of the context as being of

1 I must add that the sound of the word 'Ananas' bears a remarkable resemblance to that of my patient Irma's family name.

2 [*Footnote added* 1909, but omitted again from 1925 onwards:] In this respect the dream did not turn out to be prophetic. But in another respect it *was*. For my patient's 'unsolved' gastric pains, for which I was so anxious not to be blamed, turned out to be the forerunners of a serious disorder caused by gall-stones.

quite special importance. What was it, then, to which my attention was to be directed in this way by trimethylamine? It was to a conversation with another friend who had for many years been familiar with all my writings during the period of their gestation, just as I had been with his.[1] He had at that time confided some ideas to me on the subject of the chemistry of the sexual processes, and had mentioned among other things that he believed that one of the products of sexual metabolism was trimethylamine. Thus this substance led me to sexuality, the factor to which I attributed the greatest importance in the origin of the nervous disorders which it was my aim to cure. My patient Irma was a young widow; if I wanted to find an excuse for the failure of my treatment in her
[117] case, what I could best appeal to would no doubt be this fact of her widowhood, which her friends would be so glad to see changed. And how strangely, I thought to myself, a dream like this is put together! The other woman, whom I had as a patient in the dream instead of Irma, was also a young widow.

I began to guess why the formula for trimethylamine had been so prominent in the dream. So many important subjects converged upon that one word. Trimethylamine was an allusion not only to the immensely powerful factor of sexuality, but also to a person whose agreement I recalled with satisfaction whenever I felt isolated in my opinions. Surely this friend who played so large a part in my life must appear again elsewhere in these trains of thought. Yes. For he had a special knowledge of the consequences of affections of the nose and its accessory cavities; and he had drawn scientific attention to some very remarkable connections between the turbinal bones and the female organs of sex. (Cf. the three curly structures in Irma's throat.) I had had Irma examined by him to see whether her gastric pains might be of nasal origin. But he suffered himself from suppurative rhinitis, which caused me anxiety; and no doubt there was an allusion to this in the pyaemia which vaguely came into my mind in connection with the metastases in the dream.[2]

Injections of that sort ought not to be made so thoughtlessly. Here an accusation of thoughtlessness was being made directly against my friend

1 [This was Wilhelm Fliess, the Berlin biologist and nose and throat specialist, who exercised a great influence on Freud during the years immediately preceding the publication of this book, and who figures frequently, though as a rule anonymously, in its pages. See Freud (1950*a*), *RSE*, **1**, 203 ff.]

2 [The analysis of this part of the dream is further elaborated below (p. 261 f.). It had already been used by Freud as an example of the mechanism of displacement in Section 21 of Part I of his 'Project for a Scientific Psychology', written in the autumn of 1895 and printed as an Appendix to Freud (1950*a*). It is included in *RSE*, **1**, 366–7.]

Otto. I seemed to remember thinking something of the same kind that afternoon when his words and looks had appeared to show that he was siding against me. It had been some such notion as: 'How easily his thoughts are influenced! How thoughtlessly he jumps to conclusions!' – Apart from this, this sentence in the dream reminded me once more of my dead friend who had so hastily resorted to cocaine injections. As I have said, I had never contemplated the drug being given by injection. I noticed too that in accusing Otto of thoughtlessness in handling chemical substances I was once more touching upon the story of the unfortunate Mathilde, which gave grounds for the same accusation against myself. Here I was evidently collecting instances of my conscientiousness, but also of the reverse.

And probably the syringe had not been clean. This was yet another [118]
accusation against Otto, but derived from a different source. I had happened the day before to meet the son of an old lady of eighty-two, to whom I had to give an injection of morphia twice a day.[1] At the moment she was in the country and he told me that she was suffering from phlebitis. I had at once thought it must be an infiltration caused by a dirty syringe. I was proud of the fact that in two years I had not caused a single infiltration; I took constant pains to be sure that the syringe was clean. In short, I was conscientious. The phlebitis brought me back once more to my wife, who had suffered from thrombosis during one of her pregnancies; and now three similar situations came to my recollection involving my wife, Irma and the dead Mathilde. The identity of these situations had evidently enabled me to substitute the three figures for one another in the dream.

I have now completed the interpretation of the dream.[2] While I was carrying it out I had some difficulty in keeping at bay all the ideas which were bound to be provoked by a comparison between the content of the dream and the concealed thoughts lying behind it. And in the meantime the 'meaning' of the dream was borne in upon me. I became aware of an intention which was carried into effect by the dream and which must have been my motive for dreaming it. The dream fulfilled certain wishes which were started in me by the events of the previous evening (the news given me by Otto and my writing out of the case history). The conclusion

1 [This old lady makes frequent appearances in Freud's writings at this period. See below, p. 212 f., and *The Psychopathology of Everyday Life* (1901*b*), Chapter VIII (*b* and *g*) and Chapter XII (C*b*). Her death is reported in a letter to Fliess of July 8, 1901 (Freud, 1950*a*, Letter 145).]

2 [*Footnote added* 1909:] Though it will be understood that I have not reported everything that occurred to me during the process of interpretation.

of the dream, that is to say, was that I was not responsible for the persistence of Irma's pains, but that Otto was. Otto had, in fact, annoyed me by his remarks about Irma's incomplete cure, and the dream gave me my revenge by throwing the reproach back on to him. The dream acquitted me of the responsibility for Irma's condition by showing that it was due to other factors – it produced a whole series of reasons. The dream
[119] represented a particular state of affairs as I should have wished it to be. *Thus its content was the fulfilment of a wish and its motive* [*Motiv*] *was a wish*.

Thus much leapt to the eyes. But many of the details of the dream also became intelligible to me from the point of view of wish fulfilment. Not only did I revenge myself on Otto for being too hasty in taking sides against me by representing him as being too hasty in his medical treatment (in giving the injection); but I also revenged myself on him for giving me the bad liqueur which had an aroma of fusel oil. And in the dream I found an expression which united the two reproaches: the injection was of a preparation of propyl. This did not satisfy me and I pursued my revenge further by contrasting him with his more trustworthy competitor. I seemed to be saying: 'I like *him* better than *you*.' But Otto was not the only person to suffer from the vials of my wrath. I took revenge as well on my disobedient patient by exchanging her for one who was wiser and less recalcitrant. Nor did I allow Dr M. to escape the consequences of his contradiction but showed him by means of a clear allusion that he was an ignoramus on the subject. ('*Dysentery will supervene*, etc.') Indeed I seemed to be appealing from him to someone else with greater knowledge (to my friend who had told me of trimethylamine) just as I had turned from Irma to her friend and from Otto to Leopold. 'Take these people away! Give me three others of my choice instead! Then I shall be free of these undeserved reproaches!' The groundlessness of the reproaches was proved for me in the dream in the most elaborate fashion. *I* was not to blame for Irma's pains, since she herself was to blame for them by refusing to accept my solution. *I* was not concerned with Irma's pains, since they were of an organic nature and quite incurable by psychological treatment. Irma's pains could be satisfactorily explained by her widowhood (cf. the trimethylamine) which *I* had no means of altering. Irma's pains had been caused by Otto giving her an incautious injection of an unsuitable drug – a thing *I* should never have done. Irma's pains were the result of an injection with a dirty needle, like my old lady's phlebitis – whereas *I* never did any harm with my injections. I noticed, it is true, that these explanations of Irma's pains (which

agreed in exculpating me) were not entirely consistent with one another, and indeed that they were mutually exclusive. The whole plea – for the dream was nothing else – reminded one vividly of the defence put forward by the man who was charged by one of his neighbours with having [120] given him back a borrowed kettle in a damaged condition. The defendant asserted first, that he had given it back undamaged; secondly, that the kettle had a hole in it when he borrowed it; and thirdly, that he had never borrowed a kettle from his neighbour at all. So much the better: if only a single one of these three lines of defence were to be accepted as valid, the man would have to be acquitted.[1]

Certain other themes played a part in the dream, which were not so obviously connected with my exculpation from Irma's illness: my daughter's illness and that of my patient who bore the same name, the injurious effect of cocaine, the disorder of my patient who was travelling in Egypt, my concern about my wife's health and about that of my brother and of Dr M., my own physical ailments, my anxiety about my absent friend who suffered from suppurative rhinitis. But when I came to consider all of these, they could all be collected into a single group of ideas and labelled, as it were, 'concern about my own and other people's health – professional conscientiousness'. I called to mind the obscure disagreeable impression I had had when Otto brought me the news of Irma's condition. This group of thoughts that played a part in the dream enabled me retrospectively [*nachträglich*] to put this transient impression into words. It was as though he had said to me: 'You don't take your medical duties seriously enough. You're not conscientious; you don't carry out what you've undertaken.' Thereupon, this group of thoughts seemed to have put itself at my disposal, so that I could produce evidence of how highly conscientious I was, of how deeply I was concerned about the health of my relations, my friends and my patients. It was a noteworthy fact that this material also included some disagreeable memories, which supported my friend Otto's accusation rather than my own vindication. The material was, as one might say, impartial; but nevertheless there was an unmistakable connection between this more extensive group of thoughts which underlay the dream and the narrower subject of the dream which gave rise to the wish to be innocent of Irma's illness.

I will not pretend that I have completely uncovered the meaning of this [121] dream or that its interpretation is without a gap. I could spend much more time over it, derive further information from it and discuss fresh

1 [This anecdote is discussed by Freud in Chapter II, Section 8, and Chapter VII, Section 2, of his book on *Jokes* (Freud, 1905*c*; *RSE*, **8**), in the second instance in relation to this passage.]

problems raised by it. I myself know the points from which further trains of thought could be followed. But considerations which arise in the case of every dream of my own restrain me from pursuing my interpretative work. If anyone should feel tempted to express a hasty condemnation of my reticence, I would advise him to make the experiment of being franker than I am.[1] For the moment I am satisfied with the achievement of this one piece of fresh knowledge. If we adopt the method of interpreting dreams which I have indicated here, we shall find that dreams really have a meaning and are far from being the expression of a fragmentary activity of the brain, as the authorities have claimed. *When the work of interpretation has been completed, we perceive that a dream is the fulfilment of a wish*.[2]

1 [Many theories have been offered in the secondary literature as to 'the points from which further trains of thought could be followed' in order to reveal the undisclosed latent sexual content of Freud's specimen dream (e.g. Schur, 1966, Anzieu, 1975, Elms, 1980). To these may be added the observation that trimethylamine – the chemical formula for which Freud saw so vividly in the dream: $N(CH_3)_3$ – is mentioned in the study on cocaine which he cites on p. 99 above, with special reference to its *smell*. The characteristic fishy odour associated with vaginal discharge is due to a bacterial reduction which yields this organic compound.]

2 [In a letter to Fliess on June 12, 1900, Freud (1950*a*, Letter 137) describes a later visit to Bellevue, the house where he had this dream. 'Do you suppose', he writes, 'that some day a marble tablet will be placed on the house, inscribed with these words? –

> In This House, on July 24, 1895
> the Secret of Dreams was Revealed
> to Dr Sigm. Freud

At the moment there seems little prospect of it.' Such a tablet was erected on May 6, 1977, near the site where the house (now demolished) once stood.]

Schloss Bellevue, 1892

Schloss Bellevue, 1892

During a stay at this house, Freud dreamt and interpreted the 'specimen dream' which was reported in the previous chapter. It was the first dream that he was able to decode to his satisfaction. The house was set on a hill in the Vienna woods. It was at that time rented to summer vacationers and it was later converted into a spa hotel, before becoming dilapidated and eventually destroyed in the 1960s.

Austrian National Library, Vienna. 135.157-D.

III
A DREAM IS THE FULFILMENT OF A WISH

When, after passing through a narrow defile, we suddenly emerge upon [122]
a piece of high ground, where the path divides and the finest prospects open up on every side, we may pause for a moment and consider in which direction we shall first turn our steps.[1] Such is the case with us, now that we have surmounted the first interpretation of a dream. We find ourselves in the full daylight of a sudden discovery. Dreams are not to be likened to the unregulated sounds that rise from a musical instrument struck by the blow of some external force instead of by a player's hand [cf. p. 69 above]; they are not meaningless, they are not absurd; they do not imply that one portion of our store of ideas is asleep while another portion is beginning to wake. On the contrary, they are psychical phenomena of complete validity – fulfilments of wishes; they can be inserted into the chain of intelligible waking mental acts; they are constructed by a highly complicated activity of the mind.

But no sooner have we begun to rejoice at this discovery than we are assailed by a flood of questions. If, as we are told by dream interpretation, a dream represents a fulfilled wish, what is the origin of the remarkable and puzzling form in which the wish fulfilment is expressed? What alteration have the dream thoughts undergone before being changed into the manifest dream which we remember when we wake up? How does that alteration take place? What is the source of the material that has been modified into the dream? What is the source of the many peculiarities that are to be observed in the dream thoughts – such, [123]
for instance, as the fact that they may be mutually contradictory? (Cf. the analogy of the borrowed kettle on p. 107.) Can a dream tell us anything new about our internal psychical processes? Can its content correct opinions we have held during the day?

1 [In a letter to Fliess of August 6, 1899, Freud (1950*a*, Letter 114) describes the opening chapters of this book as follows: 'The whole thing is planned on the model of an imaginary walk. First comes the dark wood of the authorities (who cannot see the trees), where there is no clear view and it is easy to go astray. Then there is a cavernous defile through which I lead my readers – my specimen dream with its peculiarities, its details, its indiscretions and its bad jokes – and then, all at once, the high ground and the open prospect and the question: "Which way do you want to go?"']

I propose that for the moment we should leave all these questions on one side and pursue our way further along one particular path. We have learnt that a dream can represent a wish as fulfilled. Our first concern must be to enquire whether this is a universal characteristic of dreams or whether it merely happened to be the content of the particular dream (the dream of Irma's injection) which was the first that we analysed. For even if we are prepared to find that every dream has a meaning and a psychical value, the possibility must remain open of this meaning not being the same in every dream. Our first dream was the fulfilment of a wish; a second one might turn out to be a fulfilled fear; the content of a third might be a reflection; while a fourth might merely reproduce a memory. Shall we find other wishful dreams besides this one? or are there perhaps no dreams but wishful ones?

It is easy to prove that dreams often reveal themselves without any disguise as fulfilments of wishes; so that it may seem surprising that the language of dreams was not understood long ago. For instance, there is a dream that I can produce in myself as often as I like – experimentally, as it were. If I eat anchovies or olives or any other highly salted food in the evening, I develop thirst during the night which wakes me up. But my waking is preceded by a dream; and this always has the same content, namely, that I am drinking. I dream I am swallowing down water in great gulps, and it has the delicious taste that nothing can equal but a cool drink when one is parched with thirst. Then I wake up and have to have a real drink. This simple dream is occasioned by the thirst which I become aware of when I wake. The thirst gives rise to a wish to drink, and the dream shows me that wish fulfilled. In doing so it is performing a function – which it was easy to divine. I am a good sleeper and not accustomed to be woken by any physical need. If I can succeed in appeasing my thirst by *dreaming* that I am drinking, then I need not wake up in order to
[124] quench it. This, then, is a dream of convenience. Dreaming has taken the place of action, as it often does elsewhere in life. Unluckily my need for water to quench my thirst cannot be satisfied by a dream in the same way as my thirst for revenge against my friend Otto and Dr M.; but the good intention is there in both cases. Not long ago this same dream of mine showed some modification. I had felt thirsty even before I fell asleep, and I had emptied a glass of water that stood on the table beside my bed. A few hours later during the night I had a fresh attack of thirst, and this had inconvenient results. In order to provide myself with some water I should have had to get up and fetch the glass standing on the table by my wife's bed. I therefore had an appropriate dream that my wife was giving me a

drink out of a vase; this vase was an Etruscan cinerary urn which I had brought back from a journey to Italy and had since given away. But the water in it tasted so salty (evidently because of the ashes in the urn) that I woke up. It will be noticed how conveniently everything was arranged in this dream. Since its only purpose was to fulfil a wish, it could be completely egoistical [*egoistisch*]. A love of comfort and convenience is not really compatible with consideration for other people. The introduction of the cinerary urn was probably yet another wish fulfilment. I was sorry that the vase was no longer in my possession – just as the glass of water on my wife's table was out of my reach. The urn with its ashes fitted in, too, with the salty taste in my mouth which had now grown stronger and which I knew was bound to wake me.[1]

Dreams of convenience like these were very frequent in my youth. [125] Having made it a practice as far back as I can remember to work late into the night, I always found it difficult to wake early. I used then to have a dream of being out of bed and standing by the washing-stand; after a while I was no longer able to disguise from myself the fact that I was really still in bed, but in the meantime I had had a little more sleep. A slothful dream of this kind, which was expressed in a particularly amusing and elegant form, has been reported to me by a young medical colleague who seems to share my liking for sleep. The landlady of his lodgings in the neighbourhood of the hospital had strict instructions to wake him in time every morning but found it no easy job to carry them out. One morning sleep seemed peculiarly sweet. The landlady called through the door: 'Wake up, Herr Pepi! It's time to go to the hospital!' In response to this he had a dream that he was lying in bed in a room in the hospital, and that there was a card over the bed on which was written: 'Pepi H., medical student, age 22.' While he was dreaming, he said to himself 'As I'm already *in* the hospital, there's no need for me to go

1 Weygandt (1893, 41) was aware of the occurrence of thirst dreams, for he writes: 'The sensation of thirst is perceived with greater precision than any other; it always gives rise to an idea of its being quenched. The manner in which the thirst is represented as being quenched in the dream varies, and derives its special form from some nearby memory. Another general feature in these cases is that immediately after the idea of the thirst being quenched there follows a disappointment over the small effect produced by the imaginary refreshment.' Weygandt, however, overlooks the fact that this reaction of a dream to a stimulus is one which holds good universally. Other people who are attacked by thirst in the night may wake up without having had a dream; but that is no objection to my experiment. It merely shows that they are worse sleepers than I am. – [*Added* 1914:] Compare in this connection *Isaiah* xxix, 8: 'It shall even be as when a hungry man dreameth, and, behold, he eateth; but he awaketh, and his soul is empty: or as when a thirsty man dreameth, and, behold, he drinketh; but he awaketh, and, behold, he is faint, and his soul hath appetite.'

there' – and turned over and went on sleeping. In this way he openly confessed the motive for his dream.[1]

Here is another dream in which once again the stimulus produced its effect during actual sleep. One of my women patients, who had been obliged to undergo an operation on her jaw which had taken an unfavourable course,[2] was ordered by her doctors to wear a cooling apparatus on the side of her face day and night. But as soon as she fell asleep she used to throw it off. One day, after she had once more thrown the apparatus on the floor, I was asked to speak to her seriously about it. 'This time I really couldn't help it,' she answered. 'It was because of a dream I had in the night. I dreamt I was in a box at the opera and very much enjoying the performance. But Herr Karl Meyer was in the nursing home and complaining bitterly of pains in his jaw. So I told myself that as I hadn't any pain I didn't need the apparatus; and I threw it away.' The dream of this poor sufferer seems almost like a concrete representation of a phrase that sometimes forces its way on to people's
[126] lips in unpleasant situations: 'I must say I could think of something more agreeable than this.' The dream gives a picture of this more agreeable thing. The Herr Karl Meyer on to whom the dreamer transplanted her pains was the most indifferent young man of her acquaintance that she could call to mind.

The wish fulfilment can be detected equally easily in some other dreams which I have collected from normal people. A friend of mine, who knows my theory of dreams and has told his wife of it, said to me one day: 'My wife has asked me to tell you that she had a dream yesterday that she was having her period. You can guess what that means.' I could indeed guess it. The fact that this young married woman dreamt that she was having her period meant that she had missed her period. I could well believe that she would have been glad to go on enjoying her freedom a little longer before shouldering the burden of motherhood. It was a neat way of announcing her first pregnancy. Another friend of mine wrote and told me that, not long before, his wife had dreamt that she had noticed some milk stains on the front of her vest. This too was an announcement of pregnancy, but not of a first one. The young mother was wishing that she might have more nourishment to give her second child than she had had for her first.

1 [This dream was reported by Freud in a letter to Fliess, dated March 4, 1895 (Freud, 1950*a*, Letter 22) – the earliest recorded hint at the wish-fulfilment theory.]

2 [This seems to be the patient 'Emma' who appears in both the Fliess correspondence (*RSE*, **1**, 240) and the 'Project' (ibid., 378 f.). She seems to be identical to the patient 'Irma' in the specimen dream analysed in Chapter II above (p. 95 ff.).]

A young woman had been cut off from society for weeks on end while she nursed her child through an infectious illness. After the child's recovery, she had a dream of being at a party at which, among others, she met Alphonse Daudet, Paul Bourget and Marcel Prévost; they were all most affable to her and highly amusing. All of the authors resembled their portraits, except Marcel Prévost, of whom she had never seen a picture; and he looked like . . . the disinfection officer who had fumigated the sick-room the day before and who had been her first visitor for so long. Thus it seems possible to give a complete translation of the dream: 'It's about time for something more amusing than this perpetual sick-nursing.'

These examples will perhaps be enough to show that dreams which can only be understood as fulfilments of wishes and which bear their meaning upon their faces without disguise are to be found under the most frequent and various conditions. They are mostly short and simple dreams, which afford a pleasant contrast to the confused and exuberant compositions that have in the main attracted the attention of the authorities. Nevertheless, it will repay us to pause for a moment over these [127]
simple dreams. We may expect to find the very simplest forms of dreams in *children*, since there can be no doubt that their psychical productions are less complicated than those of adults. Child psychology, in my opinion, is destined to perform the same useful services for adult psychology that the investigation of the structure or development of the lower animals has performed for research into the structure of the higher classes of animals. Few deliberate efforts have hitherto been made to make use of child psychology for this purpose.

The dreams of young children are frequently[1] pure wish fulfilments and are in that case[2] quite uninteresting compared with the dreams of adults. They raise no problems for solution; but on the other hand they are of inestimable importance in proving that, in their essential nature, dreams represent fulfilments of wishes. I have been able to collect a few instances of such dreams from material provided by my own children.

I have to thank an excursion which we made from Aussee to the lovely village of Hallstatt[3] in the summer of 1896 for two dreams: one of these

1 [This word was added in 1911. The following comment upon this qualifying adverb appears in *Gesammelte Schriften*, **3** (1925), 21: 'Experience has shown that distorted dreams, which stand in need of interpretation, are already found in children of four or five; and this is in full agreement with our theoretical views on the determining conditions of distortion in dreams.']

2 [Before 1911: 'for that reason'.]

3 [In the Salzkammergut district of Upper Austria. – 'Echerntal' (below) is misprinted 'Escherntal' in all the German editions.]

was dreamt by my daughter, who was then eight and a half, and the other by her brother of five and a quarter. I must explain by way of preamble that we had been spending the summer on a hillside near Aussee, from which, in fine weather, we enjoyed a splendid view of the Dachstein. The Simony Hütte could be clearly distinguished through a telescope. The children made repeated attempts at seeing it through the telescope – I cannot say with what success. Before our excursion I had told the children that Hallstatt lay at the foot of the Dachstein. They very much looked forward to the day. From Hallstatt we walked up the Echerntal, which delighted the children with its succession of changing landscapes. One of them, however, the five-year-old boy, gradually
[128] became fretful. Each time a new mountain came into view he asked if that was the Dachstein and I had to say 'No, only one of the foothills.' After he had asked the question several times, he fell completely silent; and he refused point-blank to come with us up the steep path to the waterfall. I thought he was tired. But next morning he came to me with a radiant face and said: 'Last night I dreamt we were at the Simony Hütte.' I understood him then. When I had spoken about the Dachstein, he had expected to climb the mountain in the course of our excursion to Hallstatt and to find himself at close quarters with the hut which there had been so much talk about in connection with the telescope. But when he found that he was being fobbed off with foothills and a waterfall, he felt disappointed and out of spirits. The dream was a compensation. I tried to discover its details, but they were scanty: 'You have to climb up steps for six hours' – which was what he had been told.

The same excursion stirred up wishes in the eight-and-a-half-year-old girl as well – wishes which had to be satisfied in a dream. We had taken our neighbour's twelve-year-old son with us to Hallstatt. He was already a full-blown gallant, and there were signs that he had engaged the young lady's affections. Next morning she told me the following dream: 'Just fancy! I had a dream that Emil was one of the family and called you "Father" and "Mother" and slept with us in the big room like the boys. Then Mother came in and threw a handful of big bars of chocolate, wrapped up in blue and green paper, under our beds.' Her brothers, who have evidently not inherited a faculty for understanding dreams, followed the lead of the authorities and declared that the dream was nonsense. The girl herself defended one part of the dream at least; and it throws light on the theory of the neuroses to learn *which* part. 'Of course it's nonsense Emil being one of the family; but the part about the bars of chocolate isn't.' It had been precisely on that point that I had been in the

dark, but the girl's mother now gave me the explanation. On their way home from the station the children had stopped in front of a slot-machine from which they were accustomed to obtain bars of chocolate of that very kind, wrapped in shiny metallic paper. They had wanted to get some; but their mother rightly decided that the day had already fulfilled enough wishes and left this one over to be fulfilled by the dream. I myself had not observed the incident. But the part of the dream which had been [129]
proscribed by my daughter was immediately clear to me. I myself had heard our well-behaved guest telling the children on the walk to wait till Father and Mother caught up with them. The little girl's dream turned this temporary kinship into permanent adoption. Her affection was not yet able to picture any other forms of companionship than those which were represented in the dream and which were based on her relation to her brothers. It was of course impossible to discover without questioning her why the bars of chocolate were thrown under the beds.

A friend of mine has reported a dream to me which was very much like my son's. The dreamer was an eight-year-old girl. Her father had started off with several children on a walk to Dornbach,[1] with the idea of visiting the Rohrer Hütte. As it was getting late, however, he had turned back, promising the children to make up for the disappointment another time. On their way home they had passed the signpost that marks the path up to the Hameau. The children had then asked to be taken up to the Hameau; but once again for the same reason they had to be consoled with the promise of another day. Next morning the eight-year-old girl came to her father and said in satisfied tones: 'Daddy, I dreamt last night that you went with us to the Rohrer Hütte and the Hameau.' In her impatience she had anticipated the fulfilment of her father's promises.

Here is an equally straightforward dream, provoked by the beauty of the scenery at Aussee in another of my daughters, who was at that time three and a quarter. She had crossed the lake for the first time, and the crossing had been too short for her: when we reached the landing stage she had not wanted to leave the boat and had wept bitterly. Next morning she said: 'Last night I went on the lake.' Let us hope that her dream crossing had been of a more satisfying length.

My eldest boy, then eight years old, already had dreams of his phantasies coming true: he dreamt that he was driving in a chariot with Achilles and that Diomede was the charioteer. As may be guessed, he had been excited the day before by a book on the legends of Greece which had been given to his elder sister.

1 [In the hills just outside Vienna.]

If I may include words spoken by children in their sleep under the
[130] heading of dreams, I can at this point quote one of the most youthful dreams in my whole collection. My youngest daughter, then nineteen months old, had had an attack of vomiting one morning and had consequently been kept without food all day. During the night after this day of starvation she was heard calling out excitedly in her sleep: 'Anna Fweud, stwawbewwies, wild stwawbewwies, omblet, pudden!' At that time she was in the habit of using her own name to express the idea of taking possession of something. The menu included pretty well everything that must have seemed to her to make up a desirable meal. The fact that strawberries appeared in it in two varieties was a demonstration against the domestic health regulations. It was based upon the circumstance, which she had no doubt observed, that her nurse had attributed her indisposition to a surfeit of strawberries. She was thus retaliating in her dream against this unwelcome verdict.[1]

Though we think highly of the happiness of childhood because it is still innocent of sexual desires, we should not forget what a fruitful source of disappointment and renunciation, and consequently what a stimulus to dreaming, may be provided by the other of the two great vital drives
Trieb [*Lebenstrieben*][T].[2] Here is another instance of this. My nephew, aged 22 months, had been entrusted with the duty of congratulating me on my birthday and of presenting me with a basket of cherries, which are still scarcely in season at that time of year. He seems to have found the task a
[131] hard one, for he kept on repeating 'Chewwies in it' but could not be induced to hand the present over. However, he found a means of compensation. He had been in the habit every morning of telling his mother that he had a dream of the 'white soldier' – a Guards officer in his white cloak whom he had once gazed at admiringly in the street. On the day

1 The same feat was accomplished shortly afterwards by a dream produced by this little girl's grandmother – their combined ages came to some seventy years. She had been obliged to go without food for a whole day on account of a disturbance due to a floating kidney. During the following night, no doubt imagining herself back in the heyday of her girlhood, she dreamt that she had been 'asked out' to both of the principal meals and been served at both with the most appetizing delicacies. – [The little girl's dream had been reported to Fliess not long after its occurrence (Freud, 1950*a*, Letter 73 of October 31, 1897).]

2 [*Footnote added* 1911:] A closer study of the mental life of children has taught us, to be sure, that sexual drive forces [*Triebkräfte*], in infantile form, play a large enough part, and one that has been too long overlooked, in the psychical activity of children. Closer study, too, has given us grounds for feeling some doubt in regard to the happiness of childhood as it has been constructed by adults in retrospect. Cf. my *Three Essays on the Theory of Sexuality* (1905*d*). – [The remarkable inconsistency between this sentence in the text and several other passages (e.g. on p. 227 ff. below) is commented on in the Editors' Note in the last-mentioned work (*RSE*, 7, 113–14). According to a communication from Ernest Jones, the present footnote was added on a representation from Jung.]

after his birthday sacrifice he awoke with a cheerful piece of news, which could only have originated from a dream: 'Hermann eaten all the chewwies!'[1]

I do not myself know what animals dream of. But a proverb, to which my attention was drawn by one of my students, does claim to know. 'What', [132]
asks the proverb, 'do geese dream of?' And it replies: 'Of maize.'[2] The whole theory that dreams are wish fulfilments is contained in these two phrases.[3]

1 [*Footnote added* 1911:] The fact should be mentioned that children soon begin to have more complicated and less transparent dreams, and that, on the other hand, adults in certain circumstances often have dreams of a similarly simple, infantile character. The wealth of unexpected material that may occur in the dreams of children of four or five is shown by examples in my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909*b*) and in Jung (1910*c*). – [*Added* 1914:] For analytical interpretations of children's dreams see also von Hug-Hellmuth (1911 and 1913*a*), Putnam (1912*a*), van Raalte (1912), Spielrein (1913) and Tausk (1913*b*). Children's dreams are also reported by Bianchieri (1912), Busemann (1909 and 1910), Doglia & Bianchieri (1910–11) and, in particular, Wiggam (1909), who lays stress on their trend towards wish fulfilment. – [*Added* 1911:] On the other hand, dreams of an infantile type seem to occur in adults with special frequency when they find themselves in unusual external circumstances. Thus Otto Nordenskjöld (1904, **1**, 336 f.) writes as follows of the members of his expedition while they were wintering in the Antarctic: 'The direction taken by our innermost thoughts was very clearly shown by our dreams, which were never more vivid or numerous than at this time. Even those of us who otherwise dreamt but rarely had long stories to tell in the morning when we exchanged our latest experiences in this world of the imagination. They were all concerned with the outside world which was now so remote from us, though they were often adapted to our actual circumstances. One of my companions had a particularly characteristic dream of being back in his school classroom, where it was his task to skin miniature seals which had been specially prepared for instructional purposes. Eating and drinking, however, were the pivot round which our dreams most often revolved. One of us, who had a special gift for attending large luncheon parties during the night, was proud if he was able to report in the morning that he had "got through a three-course dinner". Another of us dreamt of tobacco, of whole mountains of tobacco; while a third dreamt of a ship in full sail coming in across open water. Yet another dream is worth repeating. The postman brought round the mail and gave a long explanation of why we had had to wait so long for it: he had delivered it at the wrong address and had only succeeded in recovering it with great difficulty. We dreamt, of course, of still more impossible things. But there was a most striking lack of imaginativeness shown by almost all the dreams that I dreamt myself or heard described. It would certainly be of great psychological interest if all these dreams could be recorded. And it will easily be understood how much we longed for sleep, since it could offer each one of us everything that he most eagerly desired.' [This passage is much abbreviated in the English translation of Nordenskjöld's book (1905, 290).] – *Added* 1914:] According to Du Prel (1885, 231), 'Mungo Park, when he was almost dying of thirst on one of his African journeys, dreamt unceasingly of the well-watered valleys and meadows of his home. Similarly, Baron Trenck, suffering torments of hunger while he was a prisoner in the fortress at Magdeburg, dreamt of being surrounded by sumptuous meals; and George Back, who took part in Franklin's first expedition, when he was almost dying of starvation as a result of his fearful privations, dreamt constantly and regularly of copious meals.'

2 [*Footnote added* 1911:] A Hungarian proverb quoted by Ferenczi [1910*a*] goes further and declares that 'pigs dream of acorns and geese dream of maize'. – [*Added* 1914:] A Jewish proverb runs: 'What do hens dream of? – Of millet.' (Bernstein & Segel, 1908, 116.)

3 [*Footnote added* 1914:] I am far from seeking to maintain that I am the first writer to have had the idea of deriving dreams from wishes. (Cf. the opening sentences of my next chapter.) Those who attach any importance to anticipations of this kind may go back to classical antiquity and quote Herophilus, a physician who lived under the first Ptolemy. According to Büchsenschütz

[133] It will be seen that we might have arrived at our theory of the hidden meaning of dreams most rapidly merely by following linguistic usage. It is true that common language sometimes speaks of dreams with contempt. (The phrase '*Träume sind Schäume* [Dreams are froth]' seems intended to support the scientific estimate of dreams.) But, on the whole, ordinary usage treats dreams above all as the blessed fulfillers of wishes. If ever we find our expectation surpassed by the event, we exclaim in our delight: 'I should never have imagined such a thing even in my wildest dreams.'[1]

(1868, 33), he distinguished three sorts of dreams: those which are sent by the gods, those which are natural and arise when the mind forms a picture of something that is agreeable to it and will come about, and those which are of a mixed nature and which arise of their own accord from the emergence of pictures in which we see what we wish for. J. Stärcke (1913, [248]) has drawn attention to a dream in Scherner's collection which that writer himself describes as the fulfilment of a wish. Scherner (1861, 239) writes: 'The dreamer's imagination fulfilled her waking wish so promptly, simply because that wish was emotionally active in her.' Scherner classes this dream among 'dreams of mood'; alongside it he places 'dreams of erotic yearning' in men and women, and 'dreams of ill-temper'. There is clearly no question of Scherner attributing any more importance to wishes in the instigation of dreams than to any other waking mental state: still less is there any question of his having related wishes to the essential nature of dreaming.

1 [Children's dreams (including many of those recorded in this chapter) and dreams of an infantile type are discussed in Lecture VIII of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 110 ff., and more briefly in Section III of his short study *On Dreams* (1901*a*), ibid., **5**, 582 ff.]

IV
DISTORTION IN DREAMS

If I proceed to put forward the assertion that the meaning of *every* dream [134]
is the fulfilment of a wish, that is to say that there cannot be any dreams but wishful dreams, I feel certain in advance that I shall meet with the most categorical contradiction.

'There is nothing new', I shall be told, 'in the idea that *some* dreams are to be regarded as wish fulfilments; the authorities noticed that fact long ago. Cf. Radestock (1879, 137 f.), Volkelt (1875, 110 f.), Purkinje (1846, 456), Tissié (1898, 70), Simon (1888, 42, on the hunger dreams of Baron Trenck while he was a prisoner), and a passage in Griesinger (1845, 89).[1] But to assert that there are no dreams other than wish-fulfilment dreams is only one more unjustifiable generalization, though fortunately one which it is easy to disprove. After all, plenty of dreams occur which contain the most distressing subject matter but never a sign of any wish fulfilment. Eduard von Hartmann, the philosopher of pessimism, is probably furthest removed from the wish-fulfilment theory. In his *Philosophie des Unbewussten* (1890, **2**, 344) he writes: "When it comes to dreams, we find all the annoyances of waking life carried over into the state of sleep; the only thing we do *not* find is what can to some extent reconcile an educated man to life – scientific and artistic enjoyment. . . ." But even less disgruntled observers have insisted that pain [*Schmerz*] and unpleasure [*Unlust*] are more common in dreams than pleasure [*Lust*][T]: for instance, Scholz (1893, 57), Volkelt (1875, 80), and others. Indeed two ladies, Florence Hallam and Sarah Weed (1896, [499]), have actually given statistical expression, based on a study of their own dreams, to the preponderance of unpleasure in dreaming. They find that 57.2 per cent of dreams are "disagreeable" and only 28.6 per cent positively "pleasant". And apart from these dreams, which carry over into sleep the various [135]
distressing emotions of life, there are anxiety dreams [*Angstträume*], in *Angst*

1 [*Footnote added* 1914:] A writer as early as Plotinus, the Neoplatonist, is quoted by Du Prel (1885, 276) as saying: 'When our desires are aroused, imagination comes along and, as it were, presents us with the objects of those desires.' [*Ennead*, IV, **4**, 17.]

which that most dreadful of all unpleasurable feelings holds us in its grasp till we awaken. And the commonest victims of these anxiety dreams are precisely children,[1] whose dreams you have described as undisguised wish fulfilments.'

It does in fact look as though anxiety dreams make it impossible to assert as a general proposition (based on the examples quoted in my last chapter) that dreams are wish fulfilments; indeed they seem to stamp any such proposition as an absurdity.

Nevertheless, there is no great difficulty in meeting these apparently conclusive objections. It is only necessary to take notice of the fact that my theory is not based on a consideration of the manifest content of dreams but refers to the thoughts which are shown by the work of interpretation to lie behind dreams. We must make a contrast between the *manifest* and the *latent* content of dreams. There is no question that there are dreams whose manifest content is of the most distressing kind. But has anyone tried to interpret such dreams?, to reveal the latent thoughts behind them? If not, then the two objections raised against my theory will not hold water: it still remains possible that distressing dreams and anxiety dreams, when they have been interpreted, may turn out to be fulfilments of wishes.[2]

When in the course of a piece of scientific work we come upon a problem
[136] which is difficult to solve, it is often a good plan to take up a second problem along with the original one – just as it is easier to crack two nuts together than each separately. Thus we are not only faced with the question 'How can distressing dreams and anxiety dreams be wish fulfilments?'; our reflections enable us to add a second question: 'Why is it that dreams with an indifferent content, which turn out to be wish fulfilments, do not express their meaning undisguised?' Take, for instance, the dream which I treated at such length of Irma's injection. It

1 Cf. Debacker (1881) on *pavor nocturnus*.

2 [*Footnote added* 1909:] It is hard to credit the obstinacy with which readers and critics of this book shut their eyes to this consideration and overlook the fundamental distinction between the manifest and latent content of dreams. – [*Added* 1914:] On the other hand, nothing in the literature of the subject comes so near to my hypothesis as a passage in James Sully's essay 'The Dream as a Revelation' (1893, 364). The fact that I am only now quoting it for the first time is no sign of disparagement: 'It would seem then, after all, that dreams are not the utter nonsense they have been said to be by such authorities as Chaucer, Shakespeare and Milton. The chaotic aggregations of our night-fancy have a significance and communicate new knowledge. Like some letter in cypher, the dream inscription when scrutinized closely loses its first look of balderdash and takes on the aspect of a serious, intelligible message. Or, to vary the figure slightly, we may say that, like some palimpsest, the dream discloses beneath its worthless surface-characters traces of an old and precious communication.' [Freud prints the two last sentences in spaced type.]

was not by any means of a distressing nature and interpretation showed it as a striking example of the fulfilment of a wish. But why should it have needed any interpretation at all? Why did it not say what it meant straight out? At first sight the dream of Irma's injection gave no impression that it represented a wish of the dreamer's as fulfilled. My readers will have had no such impression; but neither did I myself before I carried out the analysis. Let us describe this behaviour of dreams, which stands in so much need of explanation, as 'the phenomenon of distortion in dreams'. Thus our second problem is: what is the origin of dream distortion?

A number of possible solutions to the problem may at once occur to us: as, for instance, that some incapacity exists during sleep for giving direct expression to our dream thoughts. But the analysis of certain dreams forces us to adopt another explanation of distortion in dreams. I will exemplify this by another dream of my own. Once again this will involve me in a variety of indiscretions; but a thorough elucidation of the problem will compensate for my personal sacrifice.

PREAMBLE. – In the spring of 1897 I learnt that two professors at our university had recommended me for appointment as *professor extraordinarius*.[1] The news surprised and greatly delighted me, since it implied recognition by two eminent men, which could not be put down to any considerations of a personal kind. But I at once warned myself not to attach any expectations to the event. During the last few years the Ministry had disregarded recommendations of that sort; and several of my colleagues who were my seniors in age and at least my equals in merit had been waiting vainly for appointment. I had no reason to believe that I should be more fortunate. I therefore determined to meet the future with resignation. So far as I knew, I was not an ambitious man; I was following my profession with gratifying success even without the advantages afforded by a title. Moreover, there was no question of my pronouncing the grapes sweet or sour: they hung far too high over my head. [137]

One evening I had a visit from a friend – one of the men whose example I had taken as a warning to me. For a considerable time he had been a candidate for promotion to a professorship, a rank which in our society turns a physician into a demi-god to his patients. Less resigned

1 [Roughly equivalent to an Assistant Professor. All such appointments in Austria were made by the Minister of Education. The fact of this recommendation is reported by Freud in a letter to Fliess of February 8, 1897 (Freud, 1950*a*, Letter 58) and the dream itself is mentioned on March 15, 1897 (ibid., Letter 85). – The 'denominational considerations' mentioned below relate, of course, to anti-Semitic feeling, which was already rife in Vienna during the last years of the nineteenth century.]

than I was, however, he was in the habit of paying his respects from time to time in the offices of the Ministry with a view to advancing his prospects. He had been paying one of these visits just before calling on me. He told me that on this occasion he had driven the exalted official into a corner and had asked straight out whether the delay over his appointment was not, in fact, due to denominational considerations. The reply had been that, in view of the present state of feeling, it was no doubt true that, for the moment, His Excellency was not in a position, etc. etc. 'At least I know where I am now,' my friend had concluded. It was not news to me, though it was bound to strengthen my feeling of resignation; for the same denominational considerations applied to my own case.

On the morning after this visit I had the following dream, which was remarkable among other things for its form. It consisted of two thoughts and two pictures – each thought being succeeded by a picture. I shall, however, report only the first half of the dream here, since the other half has no connection with the purpose for which I am describing the dream.

I. . . . *My friend R. was my uncle. – I had a great feeling of affection for him*.

II. *I saw before me his face, somewhat changed. It was as though it had been drawn out lengthways. A yellow beard that surrounded it stood out especially clearly*.

[138] Then followed the two other pieces which I shall pass over – once more a thought followed by a picture.

The interpretation of the dream took place as follows.

When, during the course of the morning, the dream came into my head, I laughed aloud and said: 'The dream's nonsense!' But it refused to go away and followed me about all day, till at last in the evening I began to reproach myself: 'If one of your patients who was interpreting a dream could find nothing better to say than that it was nonsense, you would take him up about it and suspect that the dream had some disagreeable story at the back of it which he wanted to avoid becoming aware of. Treat yourself in the same way. Your opinion that the dream is nonsense only means that you have an internal resistance against interpreting it. Don't let yourself be put off like this.' So I set about the interpretation.

'*R. was my uncle*.' What could that mean? I never had more than one uncle – Uncle Josef.[1] There was an unhappy story attached to him. Once – more than thirty years ago – in his eagerness to make money, he allowed himself to be involved in a transaction of a kind that is severely punished by the law, and he was, in fact, punished for it. My father, whose hair turned grey from grief in a few days, used always to say that Uncle Josef was not a bad man but only a simpleton; those were his words. So that if my friend R. was my Uncle Josef, what I was meaning to say was that R. was a simpleton. Hardly credible and most disagreeable! – But there was the face which I saw in the dream with its elongated features and yellow beard. My uncle did, in fact, have a face like that, elongated and framed in a handsome fair beard. My friend R. had originally been extremely dark; but when black-haired people begin to turn grey they pay for the splendour of their youth. Hair by hair, their black beards go through an unpleasing change of colour: first they turn to a reddish brown, then to a yellowish brown, and only then to a definite grey. My friend R.'s beard was at that time passing through this stage – [139] and so, incidentally, was my own, as I had noticed with dissatisfaction. The face that I saw in the dream was at once my friend R.'s and my uncle's. It was like one of Galton's composite photographs. (In order to bring out family likenesses, Galton used to photograph several faces on the same plate [1907, 6 ff. and 221 ff.].) So there could be no doubt that I really did mean that my friend R. was a simpleton – like my Uncle Josef.

I still had no idea at all what could be the purpose of this comparison, against which I continued to struggle. It did not go very deep, after all, since my uncle was a criminal, whereas my friend R. bore an unblemished character . . . except for having been fined for knocking a boy down with his bicycle. Could I have had that crime in mind? That would have been making fun of the comparison. At this point I remembered another conversation which I had had a few days earlier with another colleague, N., and, now I came to think of it, upon the same subject. I had met N. in the street. He too had been recommended for a professorship. He had heard of the honour that had been paid me and had offered me his congratulations on it; but I had unhesitatingly refused to accept them. 'You are the last person', I had said, 'to make that kind of joke; you know what such a recommendation is worth from your own

1 It is astonishing to observe the way in which my memory – my waking memory – was narrowed at this point, for the purposes of the analysis. Actually I have known five of my uncles, and loved and honoured one of them. But at the moment at which I overcame my resistance to interpreting the dream I said to myself that I never had more than one uncle – the one that was intended in the dream.

experience.' 'Who can say?' he had answered – jokingly, it seemed; 'there was something definite against *me*. Don't you know that a woman once started legal proceedings against me? I needn't assure you that the case was dismissed. It was a disgraceful attempt at blackmail; and I had the greatest difficulty in saving the prosecutrix from being punished. But perhaps they may be using this at the Ministry as an excuse for not appointing me. But *you* have an unblemished character.' This told me who the criminal was, and at the same time showed me how the dream was to be interpreted and what its purpose was. My Uncle Josef represented my two colleagues who had not been appointed to professorships – the one as a simpleton and the other as a criminal. I now saw too why they were represented in this light. If the appointment of my friends R. and N. had been postponed for 'denominational' reasons, my own appointment was also open to doubt; if, however, I could attribute the rejection of my two friends to other reasons, which did not apply to
[140] me, my hopes would remain untouched. This was the procedure adopted by my dream: it made one of them, R., into a simpleton and the other, N., into a criminal, whereas *I* was neither the one nor the other; thus we no longer had anything in common; I could rejoice at my appointment to a professorship, and I could avoid drawing the distressing conclusion that R.'s report of what the high official had said to him must apply equally to me.

But I felt obliged to proceed still further with my interpretation of the dream; I felt I had not yet finished dealing with it satisfactorily. I was still uneasy over the light-heartedness with which I had degraded two of my respected colleagues in order to keep open my own path to a professorship. My dissatisfaction with my conduct, however, had diminished since I had come to realize the worth that was to be attached to expressions in dreams. I was prepared to deny through thick and thin that I really considered that R. was a simpleton and that I really disbelieved N.'s account of the blackmailing affair. Nor did I believe that Irma was really made dangerously ill through being injected with Otto's preparation of propyl. In both these cases what my dreams had expressed was only *my wish that it might be so*. The assertion in which my wish was realized sounded less absurd in the later dream than in the earlier one; it made cleverer use of the actual facts in its construction, like a well-designed slander of the kind that makes people feel that 'there's something in it'. For one of the professors in his own faculty had voted against my friend R., and my friend N. had himself innocently provided me with the material for my

aspersions. Nevertheless, I must repeat, the dream seemed to me to stand in need of further elucidation.

I then recalled that there was still a piece of the dream which the interpretation had not touched. After the idea had occurred to me that R. was my uncle, I had had a warm feeling of affection for him in the dream. Where did that feeling belong? I had naturally never had any feeling of affection for my Uncle Josef. I had been fond of my friend R. and had esteemed him for many years; but if I had gone up to him and expressed my sentiments in terms approaching the degree of affection I had felt in the dream, there could be no doubt that he would have been astonished. My affection for him struck me as ungenuine and exaggerated – like the judgement of his intellectual qualities which I had expressed by fusing his personality with my uncle's, though *there* the exaggeration had been in the opposite direction. [141] But a new light began to dawn on me. The affection in the dream did not belong to the latent content, to the thoughts that lay behind the dream; it stood in contradiction to them and was calculated to conceal the true interpretation of the dream. And probably that was precisely its raison d'être. I recalled my resistance to embarking on the interpretation, how long I had put it off and how I had declared that the dream was sheer nonsense. My psychoanalytic treatments taught me how a repudiation of that kind was to be interpreted: it had no value as a judgement but was simply an expression of emotion. If my little daughter did not want an apple that was offered to her, she asserted that the apple tasted sour without having tasted it. And if my patients behaved like the child, I knew that they were concerned with an idea which they wanted to *repress* [*verdrängen*]. The same was true of my dream. I did not want to interpret it, because the interpretation contained something that I was struggling against. When I had completed the interpretation I learnt what it was that I had been struggling against – namely, the assertion that R. was a simpleton. The affection that I felt for R. could not be derived from the latent dream thoughts; but no doubt it originated from this struggle of mine. If my dream was distorted in this respect from its latent content – and distorted into its opposite – then the affection that was manifest in the dream served the purpose of this distortion. In other words, *distortion* was shown in this case to be deliberate and to be a means of *dissimulation*. My dream thoughts had contained a slander against R.; and, in order that I might not

notice this, what appeared in the dream was the opposite, a feeling of affection for him.

It seemed as though this might be a discovery of general validity. It is true that, as was shown by the instances quoted in Chapter III, there are some dreams which are undisguised fulfilments of wishes. But in cases where the wish fulfilment is unrecognizable, where it has been disguised, there must have existed some inclination to put up a defence [*Abwehr*][T] against the wish; and owing to this defence the wish was unable to express itself except in a distorted shape. I will try to seek a social parallel to this internal event in the mind. Where can we find a similar distortion of a psychical act in social life? Only where two persons are concerned, one
[142] of whom possesses a certain degree of power which the second is obliged to take into account. In such a case the second person will distort his psychical acts or, as we might put it, will dissimulate. The politeness which I practise every day is to a large extent dissimulation of this kind; and when I interpret my dreams for my readers I am obliged to adopt similar distortions. The poet complains of the need for these distortions in the words:

> Das Beste, was du wissen kannst,
> Darfst du den Buben doch nicht sagen.[1]

A similar difficulty confronts the political writer who has disagreeable truths to tell to those in authority. If he presents them undisguised, the authorities will suppress his words – after [*nachträglich*] they have been spoken, if his pronouncement was an oral one, but beforehand, if he had intended to make it in print. A writer must beware of the censorship [*Zensur*],[2] and on its account he must soften and distort the expression of his opinion. According to the strength and sensitiveness of the censorship he finds himself compelled either merely to refrain from certain forms of attack, or to speak in allusions in place of direct references, or he must conceal his objectionable pronouncement beneath some apparently innocent disguise: for instance, he may

1 [Mephistopheles, in Goethe's *Faust*, Part I [Scene 4]: 'After all, the best of what you know may not be told to boys.' – These were favourite lines of Freud's. He uses them again on p. 405 below. He had already quoted them in letters to Fliess of December 3, 1897, and February 9, 1898 (Freud, 1950*a*, Letters 77 and 83); and, towards the end of his life, on the occasion of his reception of the Goethe Prize in 1930, he applied them to Goethe himself (Freud, 1930*e*; *RSE*, **21**, 200).]

2 [This analogy, which makes its first appearance in this passage in connection with dreams, had already been used in connection with paranoia at the end of Freud's second paper on the neuropsychoses of defence (1896*b*) and more generally in Section 2 of his chapter on psychotherapy in *Studies on Hysteria* (Breuer & Freud, 1895*d*).]

describe a dispute between two mandarins in the Middle Kingdom, when the people he really has in mind are officials in his own country. The stricter the censorship, the more far-reaching will be the disguise and the more ingenious too may be the means employed for putting the reader on the scent of the true meaning.[1]

The fact that the phenomena of censorship and of dream distortion [143]
correspond down to their smallest details justifies us in presuming that
they are similarly determined. We may therefore suppose that dreams [144]
are given their shape in individual human beings by the operation of two psychical forces [*Mächte*][T] (or we may describe them as currents or

1 [*Footnote added* 1919:] Frau Dr H. von Hug-Hellmuth (1915) has recorded a dream which is perhaps better fitted than any to justify my choice of nomenclature. In this example the dream distortion adopted the same methods as the postal censorship for expunging passages which were objectionable to it. The postal censorship makes such passages unreadable by blacking them out; the dream censorship replaced them with an incomprehensible mumble.

In order to make the dream intelligible, I must explain that the dreamer, a cultivated and highly esteemed lady, was fifty years of age. She was the widow of an officer of high rank who had died some twelve years previously and was the mother of grown sons, one of whom was in the field at the time of the dream.

Here then is the dream – which deals with 'love services' in wartime. ['*Liebesdienste*' means in the first instance 'services performed for love', i.e. 'unremunerated services'; but the term obviously courts another interpretation.] 'The patient went to Garrison Hospital No. 1 and informed the sentry at the gate that she must speak to the chief medical officer (mentioning a name that was unknown to her) as she wanted to volunteer for service at the hospital. She pronounced the word "service" in such a way that the NCO at once understood that she meant "love service". Since she was an elderly lady, after some hesitation he allowed her to pass. Instead of finding the chief medical officer, however, she reached a large and gloomy apartment in which a number of officers and army doctors were standing and sitting round a long table. She approached a staff surgeon with her request, and he understood her meaning after she had said only a few words. The actual wording of her speech in the dream was: "I and many other women and girls in Vienna are ready to . . ." at this point in the dream her words turned into a mumble ". . . for the troops – officers and other ranks without distinction." She could tell from the expressions on the officers' faces, partly embarrassed and partly sly, that everyone had understood her meaning correctly. The lady went on: "I'm aware that our decision must sound surprising, but we mean it in bitter earnest. No-one asks a soldier in the field whether or not he wishes to die." There followed an awkward silence of some minutes. The staff surgeon then put his arm round her waist and said: "Suppose, madam, it actually came to . . . (mumble)." She drew away from him, thinking to herself: "He's like all the rest of them", and replied: "Good gracious, I'm an old woman and I might never come to that. Besides, there's one condition that must be observed: age must be respected. It must never happen that an elderly woman . . . (mumble) . . . a mere boy. That would be terrible." "I understand perfectly," replied the staff surgeon. Some of the officers, and among them one who had been a suitor of hers in her youth, laughed out loud. The lady then asked to be taken to the chief medical officer, with whom she was acquainted, so that the whole matter could be thrashed out; but she found, to her consternation, that she could not recall his name. Nevertheless, the staff surgeon, most politely and respectfully, showed her the way up to the second floor by a very narrow, iron, spiral staircase, which led directly from the room to the upper storeys of the building. As she went up she heard an officer say: "That's a tremendous decision to make – no matter whether a woman's young or old! Splendid of her!" Feeling simply that she was doing her duty, she walked up an interminable staircase. – The dream was repeated twice in the course of a few weeks, with, as the lady remarked, some quite unimportant and meaningless modifications.'

[Some further comments on this dream can be found in Freud's *Introductory Lectures* (1916–17*a*), Lecture IX; *RSE*, **15**, 120 f.]

systems [*Strömungen, Systeme*]); and that one of these forces constructs the wish which is expressed by the dream, while the other exercises a censorship upon this dream wish and, by the use of that censorship, forcibly brings about a distortion in the expression of the wish. It remains to enquire as to the nature of the power enjoyed by this second agency [*Instanz*] which enables it to exercise its censorship. When we bear in mind that the latent dream thoughts are not conscious before an analysis has been carried out, whereas the manifest content of the dream is consciously remembered, it seems plausible to suppose that the privilege enjoyed by the second agency is that of permitting thoughts to enter consciousness [*Bewusstsein*]. Nothing, it would seem, can reach consciousness from the first system without passing the second agency; and the second agency allows nothing to pass without exercising its rights and making such modifications as it thinks fit in the thought which is seeking admission to consciousness. Incidentally, this enables us to form a quite definite view [*Auffassung*] of the 'essential nature' of consciousness: we see the process of a thing becoming conscious as a specific psychical act, distinct from and independent of the process of the formation of a presentation or idea [*Vorgang des Gesetzt- oder Vorgestelltwerdens*]; and we regard consciousness as a sense organ which perceives data that arise elsewhere. It can be demonstrated that these basic assumptions are absolutely indispensable to psychopathology. We must, however, postpone our further consideration of them to a later stage. [See Chapter VII, particularly Section F; p. 545 ff. below.]

If this picture of the two psychical agencies and their relation to consciousness is accepted, there is a complete analogy in political life to the extraordinary affection which I felt in my dream for my friend R., who was treated with such contumely during the dream's interpretation. Let
[145] us imagine a society in which a struggle is in process between a ruler who is jealous of his power and an alert public opinion. The people are in revolt against an unpopular official and demand his dismissal. But the autocrat, to show that he need take no heed of the popular wish, chooses that moment for bestowing a high distinction upon the official, though there is no other reason for doing so. In just the same way my second agency, which commands the approaches to consciousness, distinguished my friend R. by a display of excessive affection simply because the wishful impulses belonging to the first system, for particular reasons of their own on which they were intent at the moment, chose to condemn him as a simpleton.[1]

1 [The analysis of this dream is continued on p. 169 ff. below. – *Footnote added* 1911:] Hypocritical dreams of this description are not uncommon events in my own case or in that of other

These considerations may lead us to feel that the interpretation of dreams may enable us to draw conclusions as to the structure [*Bau*][T] of our mental apparatus which we have hoped for in vain from philosophy. I do not propose, however, to follow this line of thought [which is taken up in Chapter VII]; but, having cleared up the matter of distortion in dreams, I shall go back to the problem from which we started. The question raised was how dreams with a distressing content can be resolved into wish fulfilments. We now see that this is possible if dream distortion has occurred and if the distressing content serves only to disguise something that is wished for. Bearing in mind our assumption of the existence of two psychical agencies, we can further say that distressing dreams do [146]
in fact contain something which is distressing to the *second* agency, but something which at the same time fulfils a wish on the part of the *first* agency. They are wishful dreams insofar as every dream arises from the first agency; the relation of the second agency towards dreams is of a *defensive* and not of a *creative* kind.[I] If we were to restrict ourselves to considering what the second agency contributes to dreams, we could never arrive at an understanding of them: all the conundrums which the authorities have observed in dreams would remain unsolved.

The fact that dreams really have a secret meaning which represents the fulfilment of a wish must be proved afresh in each particular case by analysis. I shall therefore select a few dreams with a distressing content and attempt to analyse them. Some of them are the dreams of hysterical patients which require lengthy preambles and an occasional excursus into the psychical processes characteristic of hysteria. But I cannot escape this aggravation of the difficulties of presenting my argument. [See p. 93 above.]

people. [They are further discussed below, p. 421.] While I was engaged in working out a certain scientific problem, I was troubled for several nights in close succession by a somewhat confusing dream which had as its subject a reconciliation with a friend whom I had dropped many years before. On the fourth or fifth occasion I at last succeeded in understanding the meaning of the dream. It was an incitement to abandon my last remnants of consideration for the person in question and to free myself from him completely, and it had been hypocritically disguised as its opposite. [Cf. p. 426 below.] I have reported elsewhere [1910*l*, reprinted below, p. 356 f. *n*.] a 'hypocritical Oedipus dream', dreamt by a man, in which the hostile impulses and death wishes contained in the dream thoughts were replaced with manifest affection. Another kind of hypocritical dream will be mentioned below in Chapter VI [p. 423 ff.]. [The friend referred to in this footnote was evidently Fliess. Cf. Section IV of Kris's introduction to Freud's correspondence with Fliess (Freud, 1950*a*).]

1 [*Footnote added* 1930:] Later [pp. 426 *n*. 1 and 498 ff. below] we shall also come across instances in which, on the contrary, a dream expresses a wish on the part of the *second* agency.

As I have already explained [p. 89 f. above], when I undertake the analytic treatment of a psychoneurotic patient his dreams are invariably discussed between us. In the course of these discussions I am obliged to give him all the psychological explanations which have enabled me myself to reach an understanding of his symptoms. I am thereupon subjected to a remorseless criticism, certainly no less severe than I have to expect from the members of my own profession. And my patients invariably contradict my assertion that all dreams are fulfilments of wishes. Here, then, are some instances from the material of dreams that have been brought up against me as evidence to the contrary.

'You're always saying to me', began a clever woman patient of mine, 'that a dream is a fulfilled wish. Well, I'll tell you a dream whose subject was the exact opposite – a dream in which one of my wishes was *not* fulfilled. How do you fit that in with your theory? This was the dream:

[147] '*I wanted to give a supper party, but I had nothing in the house but a little smoked salmon. I thought I would go out and buy something, but remembered then that it was Sunday afternoon and all the shops would be shut. Next I tried to ring up some caterers, but the telephone was out of order. So I had to abandon my wish to give a supper party.*'

I answered, of course, that analysis was the only way of deciding on the meaning of the dream; though I admitted that at first sight it seemed sensible and coherent and looked like the reverse of a wish fulfilment. 'But what material did the dream arise from? As you know, the instigation to a dream is always to be found in the events of the previous day.'

ANALYSIS. – My patient's husband, an honest and capable wholesale butcher, had remarked to her the day before that he was getting too stout and therefore intended to start on a course of weight reduction. He proposed to rise early, do physical exercises, keep to a strict diet, and above all accept no more invitations to supper. – She laughingly added that her husband, at the place where he regularly lunched, had made the acquaintance of a painter, who had pressed him to be allowed to paint his portrait, as he had never seen such expressive features. Her husband, however, had replied in his blunt manner that he was much obliged, but he was sure the painter would prefer a piece of a pretty young girl's behind to the whole of his face.[1] She was very much in love with her

1 Cf. the phrase 'sitting for one's portrait' and Goethe's lines:

Und wenn er keinen Hintern hat,
Wie mag der Edle sitzen?

[And if he hasn't a behind,
How can his Lordship sit?
(From 'Totalität', 1814–15.)]

husband now and teased him a lot. She had begged him, too, not to give her any caviare.

I asked her what that meant; and she explained that she had wished for a long time that she could have a caviare sandwich every morning but had grudged the expense. Of course, her husband would have let her have it at once if she had asked him. But, on the contrary, she had asked him *not* to give her any caviare, so that she could go on teasing him about it.

This explanation struck me as unconvincing. Inadequate reasons like this usually conceal unconfessed motives. They remind one of Bernheim's [148] hypnotized patients. When one of these carries out a post-hypnotic suggestion and is asked why he is acting in this way, instead of saying that he has no idea, he feels compelled to invent some obviously unsatisfactory reason. The same was no doubt true of my patient and the caviare. I saw that she was obliged to create an unfulfilled wish for herself in her actual life; and the dream represented this renunciation as having been put into effect. But why was it that she stood in need of an unfulfilled wish?

The associations [*Einfälle*][T] which she had so far produced had not been sufficient to interpret the dream. I pressed her for some more. After a short pause, such as would correspond to the overcoming of a resistance, she went on to tell me that the day before she had visited a woman friend of whom she confessed she felt jealous because her (my patient's) husband was constantly singing her praises. Fortunately this friend of hers is very skinny and thin and her husband admires a plumper figure. I asked her what she had talked about to her thin friend. Naturally, she replied, of that lady's wish to grow a little stouter. Her friend had enquired, too: 'When are you going to ask us to another meal? You always feed one so well.'

The meaning of the dream was now clear, and I was able to say to my patient: 'It is just as though when she made this suggestion you said to yourself: "A likely thing! I'm to ask you to come and eat in my house so that you may get stout and attract my husband still more! I'd rather never give another supper party." What the dream was saying to you was that you were unable to give any supper parties, and it was thus fulfilling your wish not to help your friend to grow plumper. The fact that what people eat at parties makes them stout had been brought home to you by your husband's decision not to accept any more invitations to supper in the interests of his plan to reduce his weight.' All that was now lacking was some coincidence to confirm the solution. The smoked salmon in the dream had not yet been accounted for. 'How', I asked, 'did you arrive at the salmon that came into your dream?' 'Oh,' she replied, 'smoked salmon is my friend's favourite dish.' I happen to be acquainted with the

lady in question myself, and I can confirm the fact that she grudges herself salmon no less than my patient grudges herself caviare.

[149] The same dream admits of another and subtler interpretation, which, in fact, becomes unavoidable if we take a subsidiary detail into account. (The two interpretations are not mutually contradictory, but both cover the same ground; they are a good instance of the fact that dreams, like all other psychopathological structures [*Bildungen*], regularly have more than one meaning.) My patient, it will be remembered, at the same time as she was occupied with her dream of the renunciation of a wish, was also trying to bring about a renounced wish (for the caviare sandwich) in real life. Her friend had also given expression to a wish – to become stouter – and it would not have been surprising if my patient had dreamt that her friend's wish was unfulfilled; for my patient's own wish was that her friend's wish (to put on weight) should not be fulfilled. But instead of this she dreamt that one of her *own* wishes was not fulfilled. Thus the dream will acquire a new interpretation if we suppose that the person indicated in the dream was not herself but her friend, that she had put herself in her friend's place, or, as we might say, that she had '*identified*' herself with her friend. I believe she had, in fact, done this; and the circumstance of her having brought about a renounced wish in real life was evidence of this identification.

What is the meaning of hysterical identification? It requires a somewhat lengthy explanation. Identification is a highly important factor in the mechanism of hysterical symptoms. It enables patients to express in their symptoms not only their own experiences but those of a large number of other people; it enables them, as it were, to suffer on behalf of a whole crowd of people and to act all the parts in a play single-handed. I shall be told that this is not more than the familiar hysterical imitation, the capacity of hysterics to imitate any symptoms in other people that may have struck their attention – sympathy, as it were, intensified to the point of reproduction. This, however, does no more than show us the path along which the psychical process in hysterical imitation proceeds. The path is something different from the mental act which proceeds along it. The latter is a little more complicated than the common picture of hysterical imitation; it consists in the unconscious drawing of an inference, as an example will make clear. Supposing a physician is treating a woman patient, who is sub-
[150] ject to a particular kind of spasm, in a hospital ward among a number of other patients. He will show no surprise if he finds one morning

that this particular kind of hysterical attack has found imitators. He will merely say: 'The other patients have seen it and copied it; it's a case of psychical infection.' That is true; but the psychical infection has occurred along some such lines as these. As a rule, patients know more about one another than the doctor does about any of them; and after the doctor's visit is over they turn their attention to one another. Let us imagine that this patient had her attack on a particular day; then the others will quickly discover that it was caused by a letter from home, the revival of some unhappy love affair, or some such thing. Their sympathy is aroused and they draw the following inference, though it fails to penetrate into consciousness: 'If a cause like this can produce an attack like this, I may have the same kind of attack since I have the same grounds for having it.' If this inference were capable of entering consciousness, it might possibly give rise to a *fear* [*Angst*][T] of having the same kind of attack. But in fact the inference is made in a different psychical region, and consequently results in the actual realization of the dreaded symptom. Thus identification is not simple imitation but *assimilation* on the basis of a similar aetiological pretension; it expresses a resemblance and is derived from a common element which remains in the unconscious.

Identification is most frequently used in hysteria to express a common *sexual* element. A hysterical woman identifies herself in her symptoms most readily – though not exclusively – with people with whom she has had sexual relations or with people who have had sexual relations with the same people as herself. Linguistic usage takes this into account, for two lovers are spoken of as being 'one'. In hysterical phantasies, just as in dreams, it is enough for purposes of identification that the subject should have *thoughts* of sexual relations without their having necessarily taken place in reality. Thus the patient whose dream I have been discussing was merely following the rules of hysterical processes of thought in expressing her jealousy of her friend (which incidentally she herself knew was unjustified) by taking her place in the dream and identifying herself with her by creating a symptom – the renounced wish. The process might be expressed verbally thus: my patient put herself in her friend's place in the dream because her friend was taking my patient's place with her husband and because she (my patient) wanted to take her friend's [151] place in her husband's high opinion.[1]

1 I myself regret the insertion into my argument of excerpts from the psychopathology of hysteria. [See p. 93 above.] Their fragmentary presentation and detachment from their context

A contradiction to my theory of dreams produced by another of my women patients (the cleverest of all my dreamers) was resolved more simply, but upon the same pattern: namely that the non-fulfilment of one wish meant the fulfilment of another. One day I had been explaining to her that dreams are fulfilments of wishes. Next day she brought me a dream in which she was travelling down with her mother-in-law to the place in the country where they were to spend their holidays together. Now I knew that she had violently rebelled against the idea of spending the summer near her mother-in-law and that a few days earlier she had successfully avoided the propinquity she dreaded by engaging rooms in a far distant resort. And now her dream had undone the solution she had wished for: was not this the sharpest possible contradiction of my theory that in dreams wishes are fulfilled? No doubt; and it was only necessary to follow the dream's logical consequence in order to arrive at its interpretation. The dream showed that I was wrong. *Thus it was her wish that I might be wrong, and her dream showed that wish fulfilled*.[t] But her wish that I might be wrong, which was fulfilled in connection with her summer holidays, related, in fact, to another and more serious matter. For at about the same time I had inferred from the material produced in her analysis that at a particular period of her life something must have occurred that was of importance in determining her illness. She had disputed this, since she had no recollection of it; but soon afterwards it
[152] had turned out that I was right. Thus her wish that I might be wrong, which was transformed into her dream of spending her holidays with her mother-in-law, corresponded to a well-justified wish that the events of which she was then becoming aware for the first time might never have occurred.

I have ventured to interpret – without any analysis, but only by a guess – a small episode which occurred to a friend of mine who was in the same class as I was all through our career at a secondary school. One day he listened to a lecture which I gave before a small audience on the novel idea that dreams were wish fulfilments. He went home and dreamt that *he had lost all his cases* (he was a barrister) and afterwards arraigned me

cannot fail to detract from their enlightening effect. If, however, they serve to indicate the intimate connection between the topic of dreams and that of the psychoneuroses, they will have fulfilled the purpose for which they are inserted. – [This is Freud's first published discussion of identification, though he had referred to it earlier, in his correspondence with Fliess (e.g. in Letter 58 of February 8, 1897, and Draft L of May 2, 1897). Though he touched upon the subject here and there in later publications, his first lengthy consideration of it after the present one was more than twenty years later – in Chapter VII of *Group Psychology* (Freud, 1921*c*), *RSE*, **18**, 97 ff. The different topic of identification as part of the dream-work is discussed below on p. 285 f.]

on the subject. I evaded the issue by telling him that after all one can't win *all* one's cases. But to myself I thought: 'Considering that for eight whole years I sat on the front bench as top of the class while he drifted about somewhere in the middle, he can hardly fail to nourish a wish, left over from his schooldays, that some day or other *I* may come a complete cropper.'

A dream of a gloomier kind was also brought up against me by a patient as an objection to the theory of wishful dreams.

The patient, who was a young girl, began thus: 'As you will remember, my sister has only one boy left now – Karl; she lost his elder brother, Otto, while I was still living with her. Otto was my favourite; I more or less brought him up. I'm fond of the little one too, but of course not nearly so fond as I was of the one who died. Last night, then, I dreamt that *I saw Karl lying before me dead. He was lying in his little coffin with his hands folded and with candles all round – in fact just like little Otto, whose death was such a blow to me.* Now tell me, what can that mean? You know me. Am I such a wicked person that I can wish my sister to lose the one child she still has? Or does the dream mean that I would rather Karl were dead than Otto whom I was so much fonder of?'

I assured her that this last interpretation was out of the question. And after reflecting a little I was able to give her the correct interpretation of the dream, which she afterwards confirmed. I was able to do so because I was familiar with the whole of the dreamer's previous history.

The girl had early been left an orphan and had been brought up in the [153]
house of a much older sister. Among the friends who visited at the house was a man who made a lasting impression on her heart. For a time it had seemed as though her scarcely acknowledged relations with him would lead to marriage; but this happy outcome was brought to nothing by her sister, whose motives were never fully explained. After the breach the man ceased to visit the house; and shortly after the death of little Otto, on to whom she had meanwhile turned her affection, my patient herself set up on her own. She did not succeed, however, in freeing herself from her attachment to her sister's friend. Her pride bade her avoid him; but she was unable to transfer [*übertragen*] her love to any of the other admirers who presented themselves later. Whenever it was announced that the object of her affections, who was by profession a literary man, was to give a lecture anywhere, she was invariably in the audience; and she took every possible opportunity of seeing him from a distance on neutral ground. I remembered that she had told me the day before that

the Professor was going to a particular concert and that she intended to go to it as well so as to enjoy a glimpse of him once more. That had been on the day before the dream, and the concert was to take place on the day on which she told me the dream. It was therefore easy for me to construct the correct interpretation, and I asked her whether she could think of anything that happened after little Otto's death. She answered at once: 'Of course; the Professor came to see us again after a long absence, and I saw him once more beside little Otto's coffin.' This was exactly what I had expected, and I interpreted the dream in this way: 'If now the other boy were to die, the same thing would happen. You would spend the day with your sister and the Professor would be certain to come to offer his condolences, so that you would see him again under the same conditions as the other time. The dream means no more than your wish to see him once more, a wish which you are inwardly struggling against. I know you have a ticket for today's concert in your pocket. Your dream was a dream of impatience: it anticipated the glimpse you are to have of him today by a few hours.'

In order to conceal her wish, she had evidently chosen a situation in which such wishes are usually suppressed, a situation in which one is so
[154] much filled with grief that one has no thought of love. Yet it is quite possible that even in the real situation of which the dream was an exact replica, beside the coffin of the elder boy whom she had loved still more, she may have been unable to suppress her tender feelings for the visitor who had been absent for so long.[1]

A similar dream of another woman patient had a different explanation. When she was young she had been remarkable for her ready wit and cheerful disposition; and these characteristics were still to be seen, at all events in the ideas that occurred to her during the treatment. In the course of a longish dream, this lady imagined that she saw her only, fifteen-year-old daughter lying dead 'in a case'. She had half a mind to use the scene as an objection to the wish-fulfilment theory, though she herself suspected that the detail of the 'case' [*Schachtel*] must point the way to another view of the dream.[2] In the course of the analysis she recalled that at a party the evening before there had been some talk about the English word 'box' and the various ways in which it could be translated into German – such as '*Schachtel*' ['case'], '*Loge*' ['box at the theatre'], '*Kasten*'

1 [This dream is referred to again on pp. 220 f. and 413 f. below; it is also briefly recorded in Section IX of Freud, 1901*a* (*RSE*, **5**, 607–8).]

2 Like the smoked salmon in the dream of the abandoned supper party. [See above, p. 131 f.]

['chest'], '*Ohrfeige*' ['box on the ear'], and so on. Other portions of the same dream enabled us to discover further that she had guessed that the English 'box' was related to the German '*Büchse*' ['receptacle'], and that she had then been plagued by a recollection that '*Büchse*' is used as a vulgar term for the female genitals. If some allowance was made for the limits of her knowledge of topographical anatomy, it might be presumed, therefore, that the child lying in the case meant an embryo in the womb. After being enlightened up to this point, she no longer denied that the dream picture corresponded to a wish of hers. Like so many young married women, she had been far from pleased when she became pregnant; and more than once she had allowed herself to wish that the child in her womb might die. Indeed, in a fit of rage after a violent scene with her husband, she had beaten with her fists on her body so as to hit the child inside it. Thus the dead child was in fact the fulfilment of a wish, but of a wish that had been put aside fifteen years earlier. It is scarcely to be wondered at if a wish that was fulfilled after such a long delay was not [155]
recognized. Too much had changed in the interval.[1]

I shall have to return to the group of dreams to which the last two examples belong (dreams dealing with the death of relatives of whom the dreamer is fond) when I come to consider 'typical' dreams [p. 220 ff. below].[2] I shall then be able to show from further instances that, in spite of their unwished-for contents, all such dreams must be interpreted as wish fulfilments.

I owe the following dream, not to a patient, but to an intelligent jurist of my acquaintance. He told it to me, once again, in order to restrain me from rash generalizing on the theory of wishful dreams. 'I dreamt', said my informant, 'that *I came up to my house with a lady on my arm. A closed carriage was standing in front of it and a man came up to me, showed me his credentials as a police officer and requested me to follow him. I asked him to allow me a little time to put my affairs in order*. Can you suppose that I have a wish to be arrested?' – Of course not, I could only agree. Do you happen to know the charge on which you were arrested? – 'Yes, for infanticide, I believe.' – Infanticide? But surely you're aware that that's a crime that can only be committed by a mother on a newborn child? – 'Quite true.'[3] – And what were the circumstances in

1 [This dream is further discussed on p. 221 below, and is also reported briefly in Lecture XIII of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 175 f.]

2 [See also Freud's account of his own 'typical dreams' (ibid., **5**, 565 ff.).]

3 It often happens that the account first given of a dream is incomplete and that the memory of the omitted portions emerges only in the course of analysis. These subsequently [*nachträglich*]

which you had the dream? What happened on the previous evening? – 'I would prefer not to tell you. It's a delicate matter.' – Nevertheless, I shall have to hear it; otherwise we shall have to give up the idea of interpreting the dream. – 'Very well then, listen. I didn't spend last night at home but with a lady who means a great deal to me. When we woke up in the morning there was a further passage between us, after which I went to sleep again and had the dream I described to you.' – Is she a married woman? – 'Yes.' – And you don't want to have a child by her? – 'Oh, no; that might give us away.' – So you don't practise normal intercourse? – 'I
[156] take the precaution of withdrawing before ejaculation.' – I think I may assume that you had used this device several times during the night, and that after repeating it in the morning you felt a little uncertain whether you had carried it out successfully. – 'That's possible, no doubt.' – In that case your dream was the fulfilment of a wish. It gave you a reassurance that you had not procreated a child, or, what amounts to the same thing, that you had killed a child. The intermediate links are easily indicated. You remember that a few days ago we were talking about marriage difficulties and how inconsistent it is that there should be no objection to carrying out intercourse in such a way that no fertilization takes place, whereas any interference when once the ovum and semen have come together and a foetus has been formed is punished as a crime. We went on to recall the mediaeval controversy over the exact point of time at which the soul enters the foetus, since it is not until after that that the concept of murder becomes applicable. No doubt, too, you know Lenau's gruesome poem ['Das tote Glück'] in which child murder and child prevention are equated. – 'Oddly enough I happened to think of Lenau this morning, quite by chance, as it seemed.' – An after-echo of your dream. And now I can show you another incidental wish fulfilment contained in your dream. You came up to your house with the lady on your arm. Thus you were bringing her home,[1] instead of spending the night in her house as you did in reality. There may be more than one reason why the wish fulfilment which constitutes the core of the dream was disguised in such a disagreeable form. Perhaps you have learnt from my paper on the aetiology of anxiety neurosis [Freud, 1895*b*] that I regard *coitus interruptus* as one of the aetiological factors in the development of neurotic anxiety? It would tally with this if, after carrying out sexual intercourse in this way several times, you were left in an uneasy mood which afterwards became

added portions regularly turn out to provide the key to the dream's interpretation. Cf. the discussion below on the forgetting of dreams [p. 463 ff.].

1 [The German '*heimführen*' means both 'to bring home' and 'to marry'.]

an element in the construction of your dream. Moreover, you made use of this moodiness to help disguise the wish fulfilment. [Cf. p. 435 f. below.] Incidentally, your reference to infanticide has not been explained. How did you come to light on this specifically feminine crime? – 'I must admit that some years ago I became involved in an occurrence of that kind. I was responsible for a girl's trying to avoid the consequence of a love affair with me by means of an abortion. I had nothing to do with her [157] carrying out her intention, but for a long time I naturally felt very nervous in case the business came out.' – I quite understand that. This recollection provides a second reason why you must have been worried by your suspicion that your device might have gone wrong.[1]

A young physician who heard me describe this dream during a course of lectures must have been greatly struck by it, for he promptly redreamt it, applying the same pattern of thought to another theme. The day before, he had sent in his income-tax return, which he had filled in perfectly honestly, since he had very little to declare. He then had a dream that *an acquaintance of his came to him from a meeting of the tax commissioners and informed him that, while no objection had been raised to any of the other tax returns, general suspicion had been aroused by his and a heavy fine had been imposed on him*. The dream was a poorly disguised fulfilment of his wish to be known as a doctor with a large income. It recalls the well-known story of the girl who was advised not to accept a suitor because he had a violent temper and would be sure to beat her if they were married. 'If only he'd begun beating me already!' the girl replied. Her wish to be married was so intense that she was ready to take the threatened unpleasantness into the bargain, and even went so far as to turn it into a wish.

The very frequent dreams,[2] which appear to stand in contradiction to my theory because their subject matter is the frustration [*Versagen*]^{T} of a wish or the occurrence of something clearly unwished for, may be brought together under the heading of 'counterwish dreams'. If these dreams are considered as a whole, it seems to me possible to trace them back to two principles; I have not yet mentioned one of these, although it plays a large part not only in people's dreams but in their lives as well. One of the two driving forces [*Triebkraft*]^{T} leading to such dreams is the *Trieb* wish that I may be wrong. These dreams appear regularly in the course

1 [This dream was recorded in Draft L, attached to Freud's letter to Fliess of May 2, 1897 (Freud, 1950*a*, Letter 61).]

2 [This paragraph and the next were added in 1909.]

of my treatments when a patient is in a state of resistance to me; and I can count almost certainly on provoking one of them after I have explained
[158] to a patient for the first time my theory that dreams are fulfilments of wishes.[1] Indeed, it is to be expected that the same thing will happen to some of the readers of the present book: they will be quite ready to have one of their wishes frustrated in a dream if only their wish that I may be wrong can be fulfilled.

The same point is illustrated by one last dream of the kind which I will quote from a patient under treatment. This was the dream of a girl who had succeeded in her struggle to continue her treatment with me against the will of her relatives and of the authorities whose opinions had been consulted. *She dreamt that her people forbade her to go on coming to me. She then reminded me of a promise I had given her that if necessary I would continue the treatment without a fee. To this I replied: 'I cannot make any allowances in money matters.'* It must be admitted that it was not easy to point to the wish fulfilment in this instance. But in all such cases one discovers a second riddle, the solution to which helps one to solve the original one. What was the origin of the words she put into my mouth? Of course, I had said nothing of the kind to her; but one of her brothers, and the one by whom she was most influenced, had been good enough to attribute this sentiment to me. The dream was thus intended to prove her brother right. And it was not only in her dreams that she insisted on his being right; the same idea dominated her whole life and it was the motive of her illness.

A dream[2] which seems at first sight to put special difficulties in the way of the wish-fulfilment theory was dreamt and interpreted by a physician, and reported by August Stärcke (1911): '*I saw upon my left index finger the first indication* [*Primäraffekt*] *of syphilis on the terminal phalange*.' The reflection that, apart from the dream's unwished-for content, it appears to be clear and coherent, might dissuade us from analysing it. If, however, we are prepared to face the trouble involved, we shall find that '*Primäraffekt*' was equivalent to a '*prima affectio*' (a first love), and that the repellent ulcer turned out, to quote Stärcke's words, to 'stand for wish fulfilments that were highly charged with emotion'.

[159] The second motive for counterwish dreams[3] is so obvious that it is easy to overlook it, as I did myself for some considerable time. There is a

1 [*Footnote added* 1911:] During the last few years similar 'counterwish dreams' have repeatedly been reported to me by people who have heard me lecturing, as a reaction to first making the acquaintance of my 'wishful' theory of dreams.

2 [This paragraph was added in 1914.]

3 [This paragraph was added in 1909.]

masochistic component in the sexual constitution of many people, which arises from the reversal of an aggressive, sadistic component into its opposite.[1] Those who find their pleasure, not in having *physical* pain inflicted on them, but in humiliation and mental torture, may be described as 'mental masochists'. It will at once be seen that people of this kind can have counterwish dreams and unpleasurable dreams, which are nonetheless wish fulfilments since they satisfy their masochistic inclinations. I will quote one such dream, produced by a young man who in his earlier years had greatly tormented his elder brother, to whom he had a homosexual attachment. His character having undergone a fundamental change, he had the following dream, which was in three pieces: I. *His elder brother was chaffing him*. II. *Two grown men were caressing each other with a homosexual purpose*. III. *His brother had sold the business of which he himself had looked forward to becoming the director*. He awoke from the last dream with the most distressing feelings. Nevertheless, it was a masochistic wishful dream, and might be translated thus: 'It would serve me right if my brother were to confront me with this sale as a punishment for all the torments he had to put up with from me.'

I hope that the foregoing examples will be enough (till the next objection is raised) to make it seem plausible that even dreams with a distressing content are to be construed as wish fulfilments.[2] Nor will anyone regard it as a chance coincidence that the interpretation of these dreams has brought us up each time against topics about which people are loath to speak or to think. The distressing feeling aroused by these dreams is no doubt identical to the repugnance which tends (usually with success) to restrain us from discussing or mentioning such topics, and which each of us has to overcome if we nevertheless find ourselves compelled to embark [160] on them. But the unpleasurable feeling which thus recurs in dreams does not disprove the existence of a wish. Everyone has wishes that he would prefer not to disclose to other people, and wishes that he will not admit even to himself. On the other hand, we are justified in linking the unpleasurable character of all these dreams with the fact of dream distortion. And we are justified in concluding that these dreams are distorted and the wish fulfilment contained in them disguised to the point of being unrecognizable precisely owing to the repugnance felt for the topic of

1 [The author's amended views on this subject can be found in 'The Economic Problem of Masochism' (Freud, 1924*c*), *RSE*, **19**, 151 ff.]

2 [The following sentence was included in the text, in a slightly different form, in 1919 and printed as a footnote in 1925:] I must point out that the subject is not yet finally disposed of; I shall return to it later on. [See p. 497 ff. below.]

the dream or for the wish derived from it and to an intention to repress them. The distortion in the dream is thus shown in fact to be an act of the censorship. We shall be taking into account everything that has been brought to light by our analysis of unpleasurable dreams if we make the following modification in the formula in which we have sought to express the nature of dreams: *a dream is a (disguised) fulfilment of a (suppressed or repressed) wish*.[1]

There remain to be discussed anxiety dreams [*Angstträume*] as a special
[161] subspecies of dreams with a distressing content. The notion of regarding these as wishful dreams will meet with very little sympathy from the unenlightened. Nevertheless, I can deal with anxiety dreams very briefly at this point. They do not present us with a new aspect of the dream problem; what they face us with is the whole question of neurotic anxiety. The anxiety [*Angst*] that we feel in a dream is only *apparently* explained by the dream's content. If we submit the content of the dream to analysis, we find that the anxiety in the dream is no better justified by the dream's content than, let us say, the anxiety in a phobia is justified by the idea to which the phobia relates. No doubt it is true, for instance, that it is possible to fall out of a window and that there is therefore reason for exercising a certain degree of caution in the neighbourhood of a

1 [*Footnote added* 1914:] A great living writer, who, as I have been told, refuses to hear anything of psychoanalysis or the interpretation of dreams, has independently arrived at an almost identical formula for the nature of dreams. He speaks of a dream as 'the unauthorized emergence of suppressed desires and wishes, under false features and name'. (Spitteler, 1914, 1.)

[*Added* 1911:] I shall anticipate questions which will be discussed later by quoting at this point Otto Rank's enlargement and modification of the above basic formula: 'On the basis and with the help of repressed, infantile sexual material, dreams regularly represent present-day, and also as a rule erotic, wishes as fulfilled, in a veiled and symbolically disguised shape.' (Rank, 1910*a*, [519].)

[*Added* 1925:] I have nowhere stated that I adopted Rank's formula as my own. The shorter version, as stated in the text above, seems to me adequate. But the mere fact of my having mentioned Rank's modification has been enough to unleash countless accusations against psychoanalysis of having asserted that 'all dreams have a sexual content'.

If this sentence is taken in the sense in which it was intended, it merely shows the unconscientious manner in which critics are accustomed to perform their functions, and the readiness with which opponents overlook the clearest statements if they do not give scope to their aggressive inclinations. For only a few pages earlier [p. 113 ff.] I had mentioned the variety of the wishes whose fulfilments are to be found in children's dreams (wishes to take part in an excursion or a sail on a lake, or to make up for a missed meal, and so on); and in other passages I had discussed dreams of hunger [p. 117 *n.* 1], dreams stimulated by thirst [p. 110 f.] or by excretory needs, and dreams of mere convenience [p. 111]. Even Rank himself made no absolute assertion. The words he used were 'also *as a rule* erotic wishes', and what he said can be amply confirmed in the dreams of most adults.

The situation would be different if 'sexual' was being used by my critics in the sense in which it is now commonly employed in psychoanalysis – in the sense of 'Eros'. But my opponents are scarcely likely to have had in mind the interesting problem of whether all dreams are created by 'libidinal' drive forces [*Triebkräften*] as contrasted with 'destructive' ones. [Cf. Freud, *The Ego and the Id* (1923*b*), Chapter IV; *RSE*, **19**, 35 ff.]

window; but we cannot see why the anxiety felt in a phobia on this subject is so great and pursues the patient far beyond its occasion.[1] We find then that the same thing may be validly asserted both of phobias and of anxiety dreams: in both cases the anxiety is only superficially attached to the idea that accompanies it; it originates from another source.

Since this intimate connection exists between anxiety in dreams and in neuroses, in discussing the former I must refer to the latter. In a short paper on anxiety neurosis (Freud, 1895*b*), I argued some time ago that neurotic anxiety is derived from sexual life and corresponds to libido which has been diverted from its purpose and has found no employment.[2] Since then this formula has met the test of time; and it enables us [162]
now to infer from it that anxiety dreams are dreams with a sexual content, the libido belonging to which has been transformed into anxiety. There will be an opportunity later to support this assertion by the analysis of some neurotic patients' dreams.[3] In the course, too, of a further attempt to arrive at a theory of dreams, I shall have occasion to discuss once more the determinants of anxiety dreams and their compatibility with the theory of wish fulfilment.

1 [This particular form of phobia, the fear of falling out of windows, was referred to by Freud in a letter to Fliess of December 12, 1896 (Freud, 1950*a*, Letter 53), and again much later in his paper on 'Dreams and Telepathy' (Freud, 1922*a*), *RSE*, **18**, 189 ff.]

2 [The author's later views on the relation between libido and anxiety can be found in his *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 77 ff.]

3 [Freud evidently changed his mind on this point: see p. 519 ff. below, where, however, two anxiety dreams are analysed and the whole subject of anxiety dreams is again discussed.]

V

THE MATERIAL AND SOURCES OF DREAMS

[163] When the analysis of the dream of Irma's injection showed us that a dream could be the fulfilment of a wish, our interest was at first wholly absorbed by the question of whether we had come upon a universal characteristic of dreams, and for the time being we stifled our curiosity about any other scientific problems that may have arisen during the work of the interpretation. Having followed one path to its end, we may now retrace our steps and choose another starting point for our rambles through the problems of dream life: for the time being, we may leave the topic of wish fulfilment on one side, though we are still far from having exhausted it.

Now that the application of our procedure for interpreting dreams enables us to disclose a *latent* content in them which is of far greater significance than their *manifest* one, the pressing task at once arises of re-examining one by one the various problems raised by dreams, to see whether we may not now be in a position to find satisfactory solutions to the conundrums and contradictions which seemed intractable so long as we were only acquainted with the manifest content.

In the first chapter I have given a detailed account of the views of the authorities on the relation of dreams with waking life [Section A] and on the origin of the material of dreams [Section C]. No doubt, too, my readers will recall the three characteristics of memory in dreams [Section B], which have been so often remarked on but which have never been explained:

(1) Dreams show a clear preference for the impressions of the immediately preceding days [p. 16 above]. Cf. Robert [1886, 46], Strümpell [1877, 39], Hildebrandt [1875, 11] and Hallam & Weed [1896, 410 f.].

(2) They make their selection upon different principles from our waking memory, since they do not recall what is essential and important but what is subsidiary and unnoticed. [p. 16 ff. above.]

[164] (3) They have at their disposal the earliest impressions of our childhood and even bring up details from that period of our life which, once

again, strike us as trivial and which in our waking state we believe to have been long since forgotten. [p. 14 ff. above.][1]

All these peculiarities shown by dreams in their choice of material have, of course, only been studied by earlier writers in connection with their *manifest* content.

1 The view adopted by Robert [1886, 9 f.] that the purpose of dreams is to unburden our memory of the useless impressions of daytime [cf. p. 69 ff. above] is plainly no longer tenable if indifferent memory images from our childhood appear at all frequently in dreams. Otherwise we could only conclude that dreams perform their function most inadequately.

(A)
RECENT AND INDIFFERENT MATERIAL IN DREAMS[t]

[165] If I examine my own experience on the subject of the origin of the elements included in the content of dreams, I must begin with an assertion that in every dream it is possible to find a point of contact with the experiences of the previous day. This view is confirmed by every dream that I look into, whether my own or anyone else's. Bearing this fact in mind, I am able, on occasion, to begin a dream's interpretation by looking for the event of the previous day which set it in motion; in many instances, indeed, this is the easiest method.[1] In the two dreams which I have analysed in detail in my last chapters (the dream of Irma's injection and the dream of my uncle with a yellow beard) the connection with the previous day is so obvious as to require no further comment. But in order to show the regularity with which such a connection can be traced, I will go through the records of my own dreams and give some instances. I shall only quote enough of the dream to indicate the source we are looking for:

(1) *I was visiting a house into which I had difficulty in gaining admittance . . .; in the meantime I kept a lady* WAITING.

Source: I had had a conversation with a female relative the evening before in which I had told her that she would have to *wait* for a purchase she wanted to make till . . . etc.

(2) *I had written a* MONOGRAPH *on a certain* (indistinct) *species of plant.*

Source: That morning I had seen a *monograph* on the genus Cyclamen in the window of a bookshop. [See below, p. 150 ff.]

(3) *I saw two women in the street,* A MOTHER AND DAUGHTER, *the latter of whom was a patient of mine.*

Source: One of my patients had explained to me the previous evening the difficulties her *mother* was putting in the way of her continuing her treatment.

[166] (4) *I took out a subscription in S. and R.'s bookshop for a periodical costing* TWENTY FLORINS *a year.*

1 [The different ways of beginning the interpretation of a dream are discussed in Section I of Freud (1923*c*), *RSE*, **19**, 99.]

Source: My wife had reminded me the day before that I still owed her *twenty florins* for the weekly household expenses.

(5) *I received* A COMMUNICATION *from the Social Democratic* COMMITTEE, *treating me as though I were a* MEMBER.

Source: I had received *communications* simultaneously from the Liberal Election *Committee* and from the Council of the Humanitarian League, of which latter body I was, in fact, *a member*.

(6) *A man standing on* A CLIFF IN THE MIDDLE OF THE SEA, IN THE STYLE OF BÖCKLIN.

Source: Dreyfus on the *Île du Diable*; I had had news at the same time from my relatives in *England*, etc.

The question may be raised whether the point of contact with the dream is invariably the events of the *immediately* preceding day or whether it may go back to impressions derived from a rather more extensive period of the most recent past. It is unlikely that this question involves any matter of theoretical importance; nevertheless, I am inclined to decide in favour of the exclusiveness of the claims of the day immediately preceding the dream – which I shall speak of as the 'dream day'. Whenever it has seemed at first that the source of a dream was an impression two or three days earlier, closer enquiry has convinced me that the impression had been recalled on the previous day and thus that it was possible to show that a reproduction of the impression, occurring on the previous day, could be inserted between the day of the original event and the time of the dream; moreover, it has been possible to indicate the contingency on the previous day which may have led to the recalling of the older impression.

On the other hand,[1] I do not feel convinced that there is any regular interval of biological significance between the instigating daytime impression and its recurrence in the dream. (Swoboda, 1904, has mentioned an initial period of eighteen hours in this connection.)[2]

1 [This paragraph was added in 1909.]

2 [*Footnote added* 1911:] As I have mentioned in a postscript to my first chapter (p. 84), Hermann Swoboda [1904] has made a far-reaching application to the mental field of the biological periodic intervals of 23 and 28 days discovered by Wilhelm Fliess [1906]. He has asserted in [167] particular that these periods determine the emergence of the elements which appear in dreams. No essential modification in dream interpretation would be involved if this fact were to be established; it would merely provide a fresh source of origin of dream material. I have, however, recently made some investigations upon my own dreams, to test how far the 'theory of periodicity' is applicable to them. For this purpose I chose some specially outstanding dream elements the time of whose appearance in real life could be determined with certainty.

I. DREAM OF OCTOBER 1–2, 1910

(Fragment) . . . *Somewhere in Italy. Three daughters were showing me some small curios, as though we were in an antique shop, and were sitting on my lap. I commented on one of the objects: 'Why, you got that from me', and saw plainly before me a small profile relief with the clear-cut features of Savonarola.*

When had I last seen a portrait of Savonarola? My travel diary proved that I had been in Florence on September 4 and 5. While I was there I thought I would show my travelling companion the medallion bearing the fanatical monk's features, let into the pavement of the Piazza della Signoria, which marks the place where he was burnt. I pointed it out to him, I believe, on the morning of the 3rd. [Misprinted '5th' in recent editions.] Between this impression and its reappearance in the dream 27 + 1 days elapsed – Fliess's 'female period'. Unluckily for the conclusiveness of this example, however, I must add that on the actual 'dream day' I had a visit (for the first time since my return) from a capable but gloomy-looking medical colleague of mine whom I had many years before nicknamed 'Rabbi Savonarola'. He introduced a patient to me who was suffering from the effects of an accident on the Pontebba express, on which I myself had travelled a week earlier, and my thoughts were thus led back to my recent visit to Italy. The appearance in the content of the dream of the outstanding element 'Savonarola' is thus accounted for by my colleague's visit on the dream day; and the interval of 28 days is deprived of its significance.

II. DREAM OF OCTOBER 10–11, 1910

I was once more working at chemistry in the university laboratory. Hofrat L. invited me to come somewhere and walked in front of me along the corridor, holding a lamp or some other instrument before him in his uplifted hand and with his head stretched forward in a peculiar attitude, with a clear-sighted (? far-sighted) look about him. Then we crossed an open space . . . (The remainder was forgotten.)

The most outstanding point in the content of this dream was the way in which Hofrat L. held the lamp (or magnifying glass) before him, with his eyes peering into the distance. It was many years since I had last seen him; but I knew at once that he was only a substitute figure in the place of someone else, someone greater than he – Archimedes, whose statue stands near the Fountain of Arethusa at Syracuse in that very attitude, holding up his burning-glass and peering out towards the besieging army of the Romans. When did I see that statue for the first (and last)
[168] time? According to my diary it was on the evening of September 17; and between then and the time of the dream 13 + 10 = 23 days had elapsed – Fliess's 'male period'.

Unfortunately, when we go into the interpretation of this dream in greater detail, we once again find that the coincidence loses some of its conclusiveness. The exciting cause of the dream was the news I received on the dream day that the clinic, in whose lecture room I was able by courtesy to deliver my lectures, was shortly to be removed to another locality. I took it for granted that its new situation would be very out of the way and told myself that in that case I might just as well not have a lecture room at my disposal at all. From that point my thoughts must have gone back to the beginning of my career as a university lecturer when I, in fact, had no lecture room and when my efforts to get hold of one met with little response from the powerfully placed Hofrats and Professors. In those circumstances I had gone to L.,* who at that time held the office of Dean of the Faculty and whom I believed was friendlily disposed to me, to complain of my troubles. He promised to help me, but I heard nothing more from him. In the dream he was Archimedes, giving me a *ποῦ στῶ* [footing] and himself leading me to the new locality. Anyone who is an adept at interpretation will guess that the dream thoughts were not exactly free from ideas of vengeance and self-importance. It seems clear, in any case, that without this exciting cause Archimedes would scarcely have found his way into my dream that night; nor am I convinced that the powerful and still recent impression made on me by the statue in Syracuse might not have produced its effect after some different interval of time.

* [Professor Ernst Ludwig, Dean 1886–7 and 1891–2. (See K. R. Eissler, *Sigmund Freud und die Wiener Universität*, 1966, 36.) Cf. also Freud's *Autobiographical Study* (1925*d*), *RSE*, **20**, 13.]

Havelock Ellis [1911*a*, 224],[1] who has also given some attention to this point, declares that he was unable to find any such periodicity in his dreams in spite of looking for it. He records a dream of being in Spain and of wanting to go to a place called Daraus, Varaus or Zaraus. On waking he could not recall any such place name, and put the dream on one side. A few months later he discovered that Zaraus was, in fact, the name of a station on the line between San Sebastian and Bilbao, through which his train had passed 250 days before he had the dream. [169]

I believe, then, that the instigating agent of every dream is to be found among the experiences which one has not yet 'slept on'. Thus the relations of a dream's content to impressions of the most recent past (with the single exception of the day immediately preceding the night of the dream) differ in no respect from its relations to impressions dating from any remoter period. Dreams can select their material from any part of the dreamer's life, provided only that there is a train of thought linking the experience of the dream day (the 'recent' impressions) with the earlier ones.

But why this preference for recent impressions? We shall form some notion on this point, if we submit one of the dreams in the series I have just quoted [p. 146 above] to a fuller analysis. For this purpose I shall choose the

DREAM OF THE BOTANICAL MONOGRAPH

I had written a monograph on a certain plant. The book lay before me and I was at the moment turning over a folded coloured plate. Bound up in each copy there was a dried specimen of the plant, as though it had been taken from a herbarium.

III. DREAM OF OCTOBER 2–3, 1910

(Fragment) . . . *Something about Professor Oser, who had drawn up the menu for me himself, which had a very soothing effect*. . . . (Some more that was forgotten.)

This dream was a reaction to a digestive disturbance that day, which made me consider whether I should go to one of my colleagues to have a dietary prescribed for me. My reason for choosing Oser for that purpose, who had died in the course of the summer, went back to the death of another university teacher whom I greatly admired, which had occurred shortly before (on October 1). When had Oser died? and when had I heard of his death? According to a paragraph in the papers he had died on August 22. I had been in Holland at that time and had my Vienna newspaper sent on to me regularly; so that I must have read of his death on August 24 or 25. But here the interval no longer corresponds to either period. It amounts to 7 + 30 + 2 = 39 days or possibly 40 days. I could not recall having spoken or thought of Oser in the meantime.

Intervals such as this one, which cannot be fitted into the theory of periodicity without further manipulation, occur far more frequently in my dreams than intervals which *can* be so fitted. The only relation which I find occurs with regularity is the relation which I have insisted upon in the text and which connects the dream with some impression of the dream day.

1 [This paragraph was added in 1914.]

ANALYSIS

That morning I had seen a new book in the window of a bookshop, bearing the title *The Genus Cyclamen* – evidently a *monograph* on that plant.

Cyclamens, I reflected, were my wife's *favourite flowers* and I reproached myself for so rarely remembering to *bring* her *flowers*, which was what she liked. – The subject of '*bringing flowers*' recalled an anecdote which I had recently repeated to a circle of friends and which I had
[170] used as evidence in favour of my theory that forgetting is very often determined by an unconscious purpose and that it always enables one to deduce the secret intentions of the person who forgets.[1] A young woman was accustomed to receiving a bouquet of flowers from her husband on her birthday. One year this token of his affection failed to appear, and she burst into tears. Her husband came in and had no idea why she was crying till she told him that today was her birthday. He clasped his hand to his head and exclaimed: 'I'm so sorry, but I'd quite forgotten. I'll go out at once and fetch your *flowers*.' But she was not to be consoled; for she recognized that her husband's forgetfulness was a proof that she no longer had the same place in his thoughts as she had formerly. – This lady, Frau L., had met my wife two days before I had the dream, had told her that she was feeling quite well and enquired after me. Some years ago she had come to me for treatment.

I now made a fresh start. Once, I recalled, I really *had* written something in the nature of a *monograph on a plant*, namely a dissertation on the *coca plant* [Freud, 1884*e*], which had drawn Karl Koller's attention to the anaesthetic properties of cocaine. I had myself indicated this application of the alkaloid in my published paper, but I had not been thorough enough to pursue the matter further.[2] This reminded me that on the morning of the day after the dream – I had not found time to interpret it till the evening – I had thought about cocaine in a kind of daydream. If ever I got glaucoma, I had thought, I should travel to Berlin and get myself operated on, incognito, in my friend's [Fliess's] house, by a surgeon recommended by him. The operating surgeon, who would have no idea of my identity, would boast once again of how easily such operations could be performed since the introduction of cocaine; and I should not give the slightest hint that I myself had had a share in the discovery. This phantasy [*Phantasie*][T] had led on to reflections of

1 [The theory was published a few months after the date of the dream, in Freud (1898*b*), *RSE*, **3**, 283, and then incorporated in *The Psychopathology of Everyday Life* (Freud, 1901*b*), ibid., **6**, 1–7.]

2 [See footnote 2, p. 99 above.]

how awkward it is, when all is said and done, for a physician to ask for medical treatment for himself from his professional colleagues. The Berlin eye surgeon would not know me, and I should be able to pay his fees like anyone else. It was not until I had recalled this daydream that [171] I realized that the recollection of a specific event lay behind it. Shortly after Koller's discovery, my father had in fact been attacked by glaucoma; my friend Dr Königstein, the ophthalmic surgeon, had operated on him; while Dr Koller had been in charge of the cocaine anaesthesia and had commented on the fact that this case had brought together all of the three men who had had a share in the introduction of cocaine.

My thoughts then went on to the occasion when I had last been reminded of this business of the cocaine. It had been a few days earlier, when I had been looking at a copy of a *Festschrift* in which grateful pupils had celebrated the jubilee of their teacher and laboratory director.[1] Among the laboratory's claims to distinction which were enumerated in this book I had seen a mention of the fact that Koller had made his discovery there of the anaesthetic properties of cocaine. I then suddenly perceived that my dream was connected with an event of the previous evening. I had walked home precisely with Dr Königstein and had got into conversation with him about a matter which never fails to excite my feelings whenever it is raised. While I was talking to him in the entrance hall, Professor *Gärtner* [Gardener] and his wife had joined us; and I could not help congratulating them both on their *blooming* looks. But Professor Gärtner was one of the authors of the *Festschrift* I have just mentioned, and may well have reminded me of it. Moreover, the Frau L., whose disappointment on her birthday I described earlier, was mentioned – though only, it is true, in another connection – in my conversation with Dr Königstein.

I will make an attempt at interpreting the other determinants of the content of the dream as well. There was *a dried specimen of the plant* included in the monograph, as though it had been a *herbarium*. This led me to a memory from my secondary school. Our headmaster once called together the boys from the higher forms and handed over the school's herbarium to them to be looked through and cleaned. Some small *worms* – book-worms – had found their way into it. He does not seem to have had much confidence in my helpfulness, for he handed me only a few sheets. These, as I could still recall, included some Crucifers. I never had a specially intimate contact with botany. In my preliminary

1 [This *Festschrift* was in honour of Professor Salomon Stricker, Director of the Institute of Pathological Anatomy, at which Dr G. Gärtner was Assistent, and where Freud had worked in his student days.]

examination in botany I was also given a Crucifer to identify – and failed
[172] to do so. My prospects would not have been too bright, if I had not been helped out by my theoretical knowledge.[1] I went on from the Cruciferae to the Compositae. It occurred to me that artichokes were Compositae, and indeed I might fairly have called them my *favourite flowers*. Being more generous than I am, my wife often brought me back these favourite flowers of mine from the market.

I saw the monograph which I had written *lying before me*. This again led me back to something. I had had a letter from my friend [Fliess] in Berlin the day before in which he had shown his power of visualization: 'I am very much occupied with your dream book. *I see it lying finished before me and I see myself turning over its pages*.'[2] How much I envied him his gift as a seer! If only *I* could have seen it lying finished before me!

The folded coloured plate. While I was a medical student I was the constant victim of an impulse only to learn things out of *monographs*. In spite of my limited means, I succeeded in getting hold of a number of volumes of the proceedings of medical societies and was enthralled by their *coloured plates*. I was proud of my hankering for thoroughness. When I myself had begun to publish papers, I had been obliged to make my own drawings to illustrate them and I remembered that one of them had been so wretched that a friendly colleague had jeered at me over it. There followed, I could not quite make out how, a recollection from very early youth. It had once amused my father to hand over a book with *coloured plates* (an account of a journey through Persia) for me and my eldest sister to destroy. Not easy to justify from the educational point of view! I had been five years old at the time and my sister not yet three; and the picture of the two of us blissfully pulling the book to pieces (leaf by leaf, like an *artichoke*, I found myself saying) was almost the only plastic memory that I retained from that period of my life. Then, when I became a student, I had developed a passion for collecting and owning books, which was analogous to my liking for learning out of monographs: a *favourite hobby*. (The idea of '*favourite*' had already appeared in connection with cyclamens and artichokes.) I had become a *bookworm* (cf. *herbarium*). I had always, from the time I first began to think about myself, referred this first passion of mine back to the childhood
[173] memory I have mentioned. Or rather, I had recognized that the childhood scene was a 'screen memory' ['*Deckerinnerung*'][T] for my later

1 [This incident is described again in Freud's account of his own typical dreams (*RSE*, **5**, 567).]

2 [Freud's reply to this letter from Fliess is dated March 10, 1898 (Freud, 1950*a*, Letter 84); so that the dream must have occurred not more than a day or two earlier.]

bibliophile propensities.[1] And I had early discovered, of course, that passions often lead to sorrow. When I was seventeen I had run up a largish account at the bookseller's and had nothing to meet it with; and my father had scarcely taken it as an excuse that my inclinations might have chosen a worse outlet. The recollection of this experience from the later years of my youth at once brought back to my mind the conversation with my friend Dr Königstein. For in the course of it we had discussed the same question of my being blamed for being too much absorbed in my *favourite hobbies*.

For reasons with which we are not concerned, I shall not pursue the interpretation of this dream any further, but will merely indicate the direction in which it lay. In the course of the work of analysis I was reminded of my conversation with Dr Königstein, and I was brought to it from more than one direction. When I take into account the topics touched upon in that conversation, the meaning of the dream becomes intelligible to me. All the trains of thought starting from the dream – the thoughts about my wife's and my own favourite flowers, about cocaine, about the awkwardness of medical treatment among colleagues, about my preference for studying monographs and about my neglect of certain branches of science such as botany – all of these trains of thought, when they were further pursued, led ultimately to one or other of the many ramifications of my conversation with Dr Königstein. Once again the dream, like the one we first analysed – the dream of Irma's injection – turns out to have been in the nature of a self-justification, a plea on behalf of my own rights. Indeed, it carried the subject that was raised in the earlier dream a stage further and discussed it with reference to fresh material that had arisen in the interval between the two dreams. Even the apparently indifferent form in which the dream was couched turns out to have had significance. What it meant was: 'After all, I'm the man who wrote the valuable and memorable paper (on cocaine)', just as in the earlier dream I had said on my behalf: 'I'm a conscientious and hard-working student.' In both cases what I was insisting was: 'I may allow myself to do this.' There is, however, no need for me to carry the interpretation of the dream any further, since my only purpose in [174]
reporting it was to illustrate by an example the relation between the content of a dream and the experience of the previous day which provoked it. So long as I was aware only of the dream's *manifest* content, it appeared to be related only to a *single* event of the dream day. But when the analysis was carried out, a *second* source of the dream emerged

1 Cf. my paper on screen memories [Freud, 1899*a*; *RSE*, **3**, 295 ff.].

in another experience of the same day. The first of these two impressions with which the dream was connected was an indifferent one, a subsidiary circumstance: I had seen a book in a shop window whose title attracted my attention for a moment but whose subject matter could scarcely be of interest to me. The second experience had a high degree of psychical importance: I had had a good hour's lively conversation with my friend the eye surgeon; in the course of it I had given him some information which was bound to affect both of us closely, and I had had memories stirred up in me which had drawn my attention to a great variety of internal stresses in my own mind. Moreover, the conversation had been interrupted before its conclusion because we had been joined by acquaintances.

We must now ask what was the relation of the two impressions of the dream day to each other and to the dream of the subsequent night. In the manifest content of the dream only the *indifferent* impression was alluded to, which seems to confirm the notion that dreams have a preference for taking up unimportant details of waking life. All the strands of the interpretation, on the other hand, led to the *important* impression, to the one which had justifiably stirred my feelings. If the sense of the dream is judged, as it can only rightly be, by its latent content as revealed by the analysis, a new and significant fact is unexpectedly brought to light. The conundrum of why dreams are concerned only with worthless fragments of waking life seems to have lost all its meaning; nor can it any longer be maintained that waking life is not pursued further in dreams and that dreams are thus psychical activity wasted upon foolish material. The contrary is true: our dream thoughts are dominated by the same material that has occupied us during the day and we only bother to dream of things which have given us cause for reflection in the daytime.

Why is it, then, that, though the occasion of my dreaming was a daytime impression by which I had been justifiably stirred, I nevertheless
[175] actually dreamt of something indifferent? The most obvious explanation, no doubt, is that we are once more faced with one of the phenomena of dream distortion, which in my last chapter [p. 126 ff.] I traced to a psychical force acting as a censorship [*Zensur*]. My recollection of the monograph on the genus Cyclamen would thus serve the purpose of being an *allusion* to the conversation with my friend, just as the 'smoked salmon' in the dream of the abandoned supper party [p. 131 f.] served as an *allusion* to the dreamer's thought of her woman friend. The only question is as to the intermediate links which enabled the impression of

the monograph to serve as an allusion to the conversation with the eye surgeon, since at first sight there is no obvious connection between them. In the example of the abandoned supper party the connection was given at once: 'smoked salmon', being the friend's favourite dish, was an immediate constituent of the group of ideas which were likely to be aroused in the dreamer's mind by the personality of her friend. In this later example there were two detached impressions which at first glance only had in common the fact of their having occurred on the same day: I had caught sight of the monograph in the morning and had had the conversation the same evening. The analysis enabled us to solve the problem as follows: connections of this kind, when they are not present in the first instance, are woven retrospectively [*nachträglich*][T] between the ideational content of one impression and that of the other. I have already drawn attention to the intermediate links in the present case by the words I have italicized in my record of the analysis. If there had been no influences from another quarter, the idea of the monograph on the Cyclamen would only, I imagine, have led to the idea of its being my wife's favourite flower, and possibly also to Frau L.'s absent bouquet. I scarcely think that these background thoughts would have sufficed to evoke a dream. As we are told in *Hamlet* [Act I, Sc. 5]:

Nachträglichkeit

> There needs no ghost, my lord, come from the grave
> To tell us this.

But, lo and behold, I was reminded in the analysis that the man who interrupted our conversation was called *Gärtner* [Gardener] and that I had thought his wife looked *blooming*. And even as I write these words I recall belatedly [*nachträglich*] that one of my patients, who bore the charming name of *Flora*, was for a time the pivot of our discussion. These must have been the intermediate links, arising from the botanical group of ideas, which formed the bridge between the two experiences of that day, the indifferent and the stirring one. A further set of connections was then established – those surrounding the idea of cocaine, which had every right to serve as a link between the figure of Dr Königstein and a botanical monograph which I had written; and these connections strengthened the fusion between the two groups of ideas so that it became possible for a portion of the one experience to serve as an allusion to the other one.

[176]

I am prepared to find this explanation attacked on the ground of its being arbitrary or artificial. What, it may be asked, would have

happened if Professor Gärtner and his wife with her blooming looks had not come up to us or if the patient we were talking about had been called Anna instead of Flora? The answer is simple. If these chains of thought had been absent others would no doubt have been selected. It is easy enough to construct such chains, as is shown by the puns and riddles that people make every day for their entertainment. The realm of jokes knows no boundaries. Or, to go a stage further, if there had been no possibility of forging enough intermediate links between the two impressions, the dream would simply have been different. Another indifferent impression of the same day – for crowds of such impressions enter our minds and are then forgotten – would have taken the place of the 'monograph' in the dream, would have linked up with the subject of the conversation and would have represented it in the content of the dream. Since it was in fact the monograph and not any other idea that was chosen to serve this function, we must suppose that it was the best adapted for the connection. There is no need for us to emulate Lessing's Hänschen Schlau and feel astonished that 'only the rich people own the most money'.[1]

A psychological process by which, according to our account, indifferent experiences take the place of psychically significant ones cannot fail to arouse suspicion and bewilderment. It will be our task in a later chapter [Chapter VI, Section B; p. 272 ff.] to make the peculiarities of this apparently irrational operation more intelligible. At this point we are only concerned with the *effects* of a process whose reality I have been
[177] driven to assume by innumerable and regularly recurrent observations made in analysing dreams. What takes place would seem to be something in the nature of a 'displacement' [*Verschiebung*][T] – of psychical emphasis, shall we say? – by means of intermediate links; in this way, ideas [*Vorstellungen*] which originally had only a *weak* charge of intensity take over the charge [*Ladung*] from ideas which were originally *more intensely* cathected [*besetzten*][T2] and at last attain enough strength to enable them to force an entry into consciousness. Displacements of this kind are no surprise to us where it is a question of dealing with quantities of *affect* or with motor activities in general. When a lonely old maid transfers her affection to animals, or a bachelor becomes an enthusiastic collector, when a soldier defends a scrap of coloured

1 [From one of Lessing's *Sinngedichte* (epigrams in verse). A further lengthy discussion of this dream can be found below (p. 250 ff.).]

2 [Charged with psychical energy. See Editors' Introduction, p. xix f. above, and *RSE*, **24**, 59–61.]

cloth – a flag – with his life's blood, when a few seconds' extra pressure in a handshake means bliss to a lover, or when, in *Othello*, a lost handkerchief precipitates an outburst of rage – all of these are instances of psychical displacements to which we raise no objection. But when we hear that a decision as to what shall reach our consciousness and what shall be kept out of it – what we shall *think*, in short – has been arrived at in the same manner and on the same principles, we have an impression of a pathological event and, if such things happen in waking life, we describe them as errors in thought. I will anticipate the conclusions to which we shall later be led, and suggest that the psychical process which we have found at work in dream displacement, though it cannot be described as a pathological disturbance, nevertheless differs from the normal and is to be regarded as a process of a more *primary* nature. [See below, Chapter VII, Section E; p. 532 ff.]

Thus the fact that the content of dreams includes remnants of trivial experiences is to be explained as a manifestation of dream distortion (by displacement); and it will be recalled that we came to the conclusion that dream distortion was the product of a censorship operating in the passageway between two psychical agencies. It is to be expected that the analysis of a dream will regularly reveal its true, psychically significant source in waking life, though the emphasis has been displaced from the recollection of that source on to that of an indifferent one. This explanation brings us into complete conflict with Robert's theory [p. 69 ff.], which ceases to be of any service to us. For the fact which Robert sets out to explain is a non-existent one. His acceptance of it rests on a [178] misunderstanding, on his failure to replace the *apparent* content of dreams with their *real* meaning. And there is another objection that can be raised to Robert's theory. If it were really the business of dreams to relieve our memory of the 'dregs' of daytime recollections by a special psychical activity, our sleep would be more tormented and harder worked than our mental life while we are awake. For the number of indifferent impressions from which our memory would need to be protected is clearly immensely large: the night would not be long enough to cope with such a mass. It is far more likely that the process of forgetting indifferent impressions goes forward without the active intervention of our psychical forces [*seelischen Machte*].

Nevertheless, we must not be in a hurry to take leave of Robert's ideas without further consideration. [See p. 518 f.] We have still not explained the fact that one of the indifferent impressions of waking life, one, moreover, dating from the day preceding the dream, invariably

contributes towards the dream's content. The connections between this impression and the true source of the dream in the unconscious are not always there ready-made; as we have seen, they may only be established retrospectively [*nachträglich*], in the course of the dream-work,[1] with a view, as it were, to making the intended displacement feasible. There must therefore be some compelling force in the direction of establishing connections precisely with a recent, though indifferent, impression; and the latter must possess some attribute which makes it especially suitable for this purpose. For if that were not so, it would be just as easy for the dream thoughts to displace their emphasis on to an unimportant component in their *own* circle of ideas.

The following observations may help us towards clearing up this point. If in the course of a single day we have two or more experiences suitable for provoking a dream, the dream will make a combined reference to them as a single whole; *it is under a necessity to combine them into a unity*. Here is an instance. One afternoon during the summer I entered a railway compartment in which I found two acquaintances who were strangers to each other. One of them was an eminent medical colleague and the other was a member of a distinguished family with
[179] which I had professional relations. I introduced the two gentlemen to each other, but all through the long journey they conducted their conversation with me as a go-between, so that I presently found myself discussing various topics alternately, first with the one and then with the other. I asked my doctor friend to use his influence on behalf of a mutual acquaintance of ours who was just starting a medical practice. The doctor replied that he was convinced of the young man's capacity, but that his homely appearance would make it hard for him to make his way in families of the better class; to which I replied that that was the very reason why he needed influential assistance. Turning to my other fellow traveller, I enquired after the health of his aunt – the mother of one of my patients – who was lying seriously ill at the time. During the night following the journey I had a dream that the young friend on whose behalf I had pleaded was sitting in a fashionable drawing room in a select company composed of all the distinguished and wealthy people of my acquaintance and, with the easy bearing of a man of the world, was delivering a funeral oration on the old lady (who was already dead so far as my dream was concerned), the aunt of my second fellow traveller. (I must confess that I had not been on good terms with that lady.)

1 [*Traumarbeit*. This is the first mention of the fundamentally important concept to which the whole of the sixth and longest chapter of the book is devoted.]

Thus my dream had, once again, worked out connections between the two sets of impressions of the previous day and had combined them into a single situation.

Many experiences such as this lead me to assert that the dream-work is under some kind of necessity to combine all the sources which have acted as stimuli for the dream into a single unity in the dream itself.[1]

I will now proceed to the question of whether the instigating source of a dream, revealed by analysis, must invariably be a recent (and significant) event or whether an internal experience, that is, the *recollection* [180] of a psychically important event – a train of thought – can assume the role of a dream instigator. The answer, based upon a large number of analyses, is most definitely in favour of the latter alternative. A dream can be instigated by an internal process which has, as it were, become a recent event, owing to thought activity during the previous day.

This seems to be the appropriate moment for tabulating the different conditions to which we find that the sources of dreams are subject. The source of a dream may be either –

(*a*) a recent and psychically significant experience which is represented in the dream directly,[2] or

(*b*) several recent and significant experiences which are combined into a single unity by the dream,[3] or

(*c*) one or more recent and significant experiences which are represented in the content of the dream by a mention of a contemporary but indifferent experience,[4] or

(*d*) an internal significant experience (e.g. a memory or a train of thought), which is in that case *invariably* represented in the dream by a mention of a recent but indifferent impression.[5]

It will be seen that in interpreting dreams we find one condition always fulfilled: one component of the content of the dream is a

1 The tendency of the dream-work to fuse into a single action all events of interest which occur simultaneously has already been remarked on by several writers, e.g. Delage (1891, 41) and Delboeuf (1885, 237), who speaks of '*rapprochement forcé*' ['enforced convergence']. [Freud himself had stated this principle in the passage in *Studies on Hysteria* (Breuer & Freud, 1895*d*) quoted in the Editors' Introduction (p. xviii above). – At this point the following sentence was added in 1909 and included in every edition up to that of 1922, after which it was omitted: 'In a later chapter (on the dream-work) we shall come across this compelling impulse towards combining as an instance of "condensation" [*Verdichtung*]^{T} – another kind of primary psychical process.' (Cf. pp. 202 and 248 ff. below.)]

2 As in the dream of Irma's injection [p. 94 ff.] and in the dream of my uncle with the yellow beard [p. 121 ff.].

3 As in the young doctor's funeral oration [p. 158 f.].

4 As in the dream of the botanical monograph [p. 149 ff.].

5 Most of my patients' dreams during analysis are of this kind.

repetition of a recent impression of the previous day. This impression that is to be represented in the dream may either itself belong to the circle of ideas surrounding the actual instigator of the dream – whether as an essential or as a trivial portion of it – or it may be derived from the field of an indifferent impression which has been brought into connection with the ideas surrounding the dream instigator by more or less numerous links. The apparent multiplicity of governing conditions is in fact merely dependent upon the two alternatives of whether a displacement has or has not taken place; and it is worth pointing out that we are enabled by these alternatives to explain the range of contrast between different dreams just as easily as the medical theory is enabled to do by its hypothesis of brain cells ranging from partial to total wakefulness. (See above, p. 67 ff.)

[181] It will further be observed, if we consider these four possible cases, that a psychical element which is significant but not recent (e.g. a train of thought or a memory) can be replaced, for the purpose of forming a dream, with an element which is recent but indifferent, provided only that two conditions are fulfilled: (1) the content of the dream must be connected with a recent experience, and (2) the instigator of the dream must remain a psychically significant process. Only in one case – case (*a*) – are both of these conditions fulfilled by one and the same impression. It is to be noticed, moreover, that indifferent impressions which are capable of being used for constructing a dream so long as they are recent lose that capacity as soon as they are a day (or at the most a few days) older. From this we must conclude that the freshness of an impression gives it some kind of psychical value for purposes of dream construction equivalent in some way to the value of emotionally coloured memories or trains of thought. The basis of the value which thus attaches to recent impressions in connection with the construction of dreams will only become evident in the course of our subsequent psychological discussions.[1]

In this connection it will be noticed, incidentally, that modifications in our mnemic and ideational material may take place during the night unobserved by our consciousness. We are often advised that before coming to a final decision on some subject we should 'sleep on it', and this advice is evidently justified. But here we have passed from the psychology of dreams to that of sleep, and this is not the last occasion on which we shall be tempted to do so.[2]

1 See the passage on 'transference' [*Übertragung*]^{T} in Chapter VII [p. 503 ff. below].

2 [*Footnote added* 1919:] An important contribution to the part played by recent material in the construction of dreams has been made by Pötzl (1917) in a paper which carries a wealth of implications. In a series of experiments Pötzl required the subjects to make a drawing of what

An objection, however, may be raised which threatens to upset these last conclusions. If indifferent impressions can only find their way into [182] a dream provided they are recent, how does it happen that the content of dreams also includes elements from an earlier period of life which at the time when they were recent possessed, to use Strümpell's words [1877, 40 f.], no psychical value, and should therefore have been long since forgotten – elements, that is to say, which are neither fresh nor psychically significant?

This objection can be completely dealt with by a reference to the findings of the psychoanalysis of neurotics. The explanation is that the displacement which replaces psychically important with indifferent material (alike in dreaming and in thinking) has in these cases already taken place at the early period of life in question and since then become fixed in the memory. These particular elements which were originally indifferent are indifferent no longer, since taking over (by means of displacement) the value of psychically significant material. Nothing that has *really* remained indifferent can be reproduced in a dream.

The reader will rightly conclude from the foregoing arguments that I am asserting that there are no indifferent dream instigators – and consequently no 'innocent' dreams. Those are, in the strictest and most absolute sense, my opinions – if I leave on one side the dreams of children and perhaps brief reactions in dreams to sensations felt during the night. Apart from this, what we dream is either manifestly recognizable as psychically significant, or it is distorted and cannot be judged till the dream has been interpreted, after which it will once more be found to be significant. Dreams are never concerned with trivialities; we do not allow our sleep to be disturbed by trifles.[1] The apparently innocent [183] dreams turn out to be quite the reverse when we take the trouble to

they had consciously noted of a picture exposed to their view in a tachistoscope [an instrument for exposing an object to view for an extremely short time]. He then turned his attention to the dreams dreamt by the subjects during the following night and required them once more to make drawings of appropriate portions of these dreams. It was shown unmistakably that those details of the exposed picture which had not been noted by the subject provided material for the construction of the dream, whereas those details which had been consciously perceived and recorded in the drawing made after the exposure did not recur in the manifest content of the dream. The material that was taken over by the dream-work was modified by it for the purposes of dream construction in its familiar 'arbitrary' (or, more properly, 'autocratic') manner. The questions raised by Pötzl's experiment go far beyond the sphere of dream interpretation as dealt with in the present volume. In passing, it is worth remarking on the contrast between this new method of studying the formation of dreams experimentally and the earlier, crude technique for introducing into the dream stimuli which interrupted the subject's sleep. [Cf. p. 198 *n*. below.]

1 [*Footnote added* 1914:] Havelock Ellis, a friendly critic of this book, writes (1911*a*, 166): 'This is the point at which many of us are no longer able to follow Freud.' Havelock Ellis has not, however, carried out any analyses of dreams and refuses to believe how impossible it is to base one's judgement on their manifest content.

analyse them. They are, if I may say so, wolves in sheep's clothing. Since this is another point upon which I may expect to be contradicted, and since I am glad of an opportunity of showing dream distortion at work, I will select a number of 'innocent' dreams from my records and submit them to analysis.

I

An intelligent and cultivated young woman, reserved and undemonstrative in her behaviour, reported as follows: *I dreamt that I arrived too late at the market and could get nothing either from the butcher or from the woman who sells vegetables*. An innocent dream, no doubt; but dreams are not as simple as that, so I asked to be told it in greater detail. She thereupon gave me the following account. *She dreamt she was going to the market with her cook, who was carrying the basket. After she had asked for something, the butcher said to her: 'That's not obtainable any longer', and offered her something else, adding 'This is good too'. She rejected it and went on to the woman who sells vegetables, who tried to get her to buy a peculiar vegetable that was tied up in bundles but was of a black colour. She said: 'I don't recognize that; I won't take it.'*

The dream's connection with the previous day was quite straightforward. She had actually gone to the market too late and had got nothing. The situation seemed to shape itself into the phrase '*Die Fleischbank war schon geschlossen*' ['the meat shop was closed']. I pulled myself up: was not that, or rather its opposite, a vulgar description of a certain sort of slovenliness in a man's dress?[1] However, the dreamer herself did not use the phrase; she may perhaps have avoided using it. Let us endeavour, then, to arrive at an interpretation of the details of the dream.

When anything in a dream has the character of direct speech, that is to say, when it is said or heard and not merely thought (and it is easy as a rule to make the distinction with certainty), then it is derived from something actually spoken in waking life – though, to be sure, this something is merely treated as raw material and may be cut up and slightly
[184] altered and, more especially, divorced from its context.[2] In carrying out

1 ['*Du hast deine Fleischbank offen*' ('your meat shop's open'): Viennese slang for 'your flies are undone'.]

2 See my discussion of speeches in dreams in my chapter on the dream-work [p. 373 ff. below]. Only one writer on the subject seems to have recognized the source of spoken phrases occurring in dreams, namely Delboeuf (1885, 226), who compares them to clichés. [This dream is briefly recorded in Section VII of Freud's short essay *On Dreams* (1901*a*), *RSE*, **5**, 602.]

an interpretation, one method is to start from spoken phrases of this kind. What, then, was the origin of the butcher's remark '*That's not obtainable any longer*'? The answer was that it came from me myself. A few days earlier I had explained to the patient that the earliest experiences of childhood were '*not obtainable any longer* as such', but were replaced in analysis by 'transferences' [*Übertragungen*] and dreams.[1] So *I* was the butcher and she was rejecting these transferences into the present of old habits of thinking and feeling. – What, again, was the origin of her own remark in the dream '*I don't recognize that; I won't take it*'? For the purposes of the analysis this had to be divided up. '*I don't recognize that*' was something she had said the day before to her cook, with whom she had had a dispute; but at the time she had gone on: '*Behave yourself properly!*' At this point there had clearly been a displacement. Of the two phrases that she had used in the dispute with her cook, she had chosen the insignificant one for inclusion in the dream. But it was only the suppressed one, '*Behave yourself properly!*' that fitted in with the rest of the content of the dream: those would have been the appropriate words to use if someone had ventured to make improper suggestions and had forgotten 'to close his meat shop'. The allusions underlying the incident with the vegetable seller were a further confirmation that our interpretation was on the right track. A vegetable that is sold tied up in bundles (lengthways, as the patient added afterwards [*nachträglich*]) and is also black could only be a dream combination of asparagus and black (Spanish) radishes. No knowledgeable person of either sex will ask for an interpretation of asparagus. But the other vegetable – '*Schwarzer Rettig*' ['black radish'] – can be taken as an exclamation – '*Schwarzer, rett' dich!*' ['Blacky! Be off!'] –[2]; and accordingly it too seems to hint at the same sexual topic which we suspected at the very beginning, when we felt inclined to introduce the phrase about the meat shop being closed into the original account of the dream. We need not enquire now into the full meaning of the dream. So much is quite clear: it *had* a meaning and that meaning was far from innocent.[3] [185]

1 [This passage is referred to in a footnote to a discussion of childhood memories in Section V of Freud's case history of the 'Wolf Man' (1918*b*), ibid., **17**, 46 *n.* 2.]

2 [It seems probable that this is a reminiscence of a picture-puzzle or rebus of the kind so common in the pages of *Fliegende Blätter* and similar comic papers.]

3 If anyone is curious to know, I may add that the dream concealed a phantasy [*Phantasie*] of my behaving in an improper and sexually provocative manner, and of the patient putting up a defence against my conduct. If this interpretation seems incredible, I need only point to the numerous instances in which doctors have charges of the same kind brought against them by hysterical women. But in such cases the phantasy emerges into consciousness undisguised and in the form of a delusion, instead of being distorted and appearing only as a dream. – [*Added* 1909:] This dream occurred at the beginning of the patient's psychoanalytic treatment. It was not until

II

Here is another innocent dream, dreamt by the same patient, and in a sense a counterpart to the last one. *Her husband asked her: 'Don't you think we ought to have the piano tuned?' And she replied: 'It's not worthwhile; the hammers need reconditioning in any case.'*

Once again this was a repetition of a real event of the previous day. Her husband had asked this question and she had made some such reply. But what was the explanation of her dreaming it? She told me that the piano was a *disgusting* old *box*, that it made an *ugly noise*, that it had been in her husband's possession before their marriage,[1] and so on. But the key to the solution was only given by her words: '*It's not worthwhile*'. These were derived from a visit she had paid the day before to a woman friend. She had been invited to take off her jacket, but had refused with the words: 'Thank you, but *it's not worthwhile*; I can only stop a minute.' As she was telling me this, I recollected that during the previous day's analysis she had suddenly caught hold of her jacket, one of the buttons having come undone. Thus it was as though she were saying: 'Please don't look; *it's not worthwhile*.' In the same way the
[186] 'box' ['*Kasten*'] was a substitute for a 'chest' ['*Brustkasten*']; and the interpretation of the dream led us back at once to the time of her physical development at puberty, when she had begun to be dissatisfied by her figure. We can hardly doubt that it led back to still earlier times, if we take the word '*disgusting*' into account and the '*ugly noise*', and if we remember how often – both in *doubles entendres* and in dreams – the lesser hemispheres of a woman's body are used, whether as contrasts or as substitutes, for the larger ones.

III

I will interrupt this series for a moment and insert a short innocent dream produced by a young man. He dreamt that *he was putting on* [*anzieht*] *his winter overcoat once more, which was a dreadful thing*. The ostensible reason for this dream was a sudden return of cold weather. If we look more closely, however, we shall notice that the two short pieces that make up the dream are not in complete

later that I learnt that she had been repeating in it the initial trauma from which her neurosis had arisen. I have since then come across the same behaviour in other patients; having been exposed to a sexual assault in their childhood, they seek, as it were, to bring about a repetition of it in their dreams.

1 This last was a substitute for the opposite idea, as the course of the analysis will make clear.

harmony. For what could there be 'dreadful' about putting on a heavy or thick overcoat in cold weather? Moreover, the innocence of the dream was decidedly upset by the first association that occurred to the dreamer in the analysis. He recalled that a lady confided to him the day before that her youngest child owed its existence to a torn condom. On that basis he was able to reconstruct his thoughts. A thin condom was dangerous, but a thick one was bad. The condom is rightly represented as a pull-over [*Überzieher* in German], since one actually pulls it over; this [*Überzieher*] is also what a light coat is called. But an occurrence such as the lady described to him would certainly be 'dreadful' for an unmarried man.

And now let us return to our innocent lady dreamer.

IV

She was putting a candle into a candlestick; but the candle broke so that it wouldn't stand up properly. The girls at her school said she was clumsy; but the mistress said it was not her fault.

Yet again the occasion for the dream was a real event. The day before she had actually put a candle into a candlestick, though it did not break. Some transparent symbolism was being used in this dream. A candle is an object which can excite the female genitals; and, if it is broken, so that it cannot stand up properly, it means that the man is impotent. ('*It was not her fault*.') But could a carefully brought-up young woman, who had been screened from the impact of anything [187] ugly, have known that a candle might be put to such a use? As it happened, she was able to indicate how it was that she obtained this piece of knowledge. Once when they were in a rowing boat on the Rhine, another boat had passed them with some students in it. They were in high spirits and were singing, or rather shouting, a song:

> Wenn die Königin von Schweden,
> Bei geschlossenen Fensterläden
> Mit Apollokerzen . . .[1]

She either failed to hear or did not understand the last word and had to get her husband to give her the necessary explanation. The verse was

1 ['When the Queen of Sweden, behind closed shutters, . . . with Apollo candles.' 'Apollo candles' was the trade name of a familiar brand of candles. This is an extract from a well-known students' song, which has innumerable similar stanzas. The missing word is '*onaniert*' ('masturbates').]

replaced in the content of the dream with an innocent recollection of some job she had done clumsily when she was at school, and the replacement was made possible owing to the common element of *closed shutters*. The connection between the topics of masturbation and impotence is obvious enough. The 'Apollo' in the latent content of this dream linked it with an earlier one in which the virgin Pallas figured. Altogether far from innocent.

v

In order that we may not be tempted to draw conclusions too easily from dreams as to the dreamer's actual life, I will add one more dream of the same patient's, which once more has an innocent appearance. '*I dreamt*', she said, '*of what I really did yesterday: I filled a small trunk so full of books that I had difficulty in shutting it and I dreamt just what really happened.*' In this instance the narrator herself laid the chief emphasis on the agreement between the dream and reality. [Cf. pp. 19 *n*. 2 and 332 f.] All such judgements on a dream and comments upon it, though they have made themselves a place in waking thought, invariably form in fact part of the latent content of the dream, as we shall find confirmed by other examples later on [p. 397 ff.]. What we were being told, then, was that what the dream described had really happened the
[188] day before. It would take up too much space to explain how it was that the idea occurred to me of making use of the English language in the interpretation. It is enough to say that once again what was in question was a little 'box' (cf. the dream of the dead child in the 'case', p. 136 f.) which was so full that nothing more could get into it. Anyhow, nothing bad this time.

In all of these 'innocent' dreams the motive for the censorship is obviously the sexual factor. This, however, is a subject of prime importance which I must leave on one side.

(B)
INFANTILE MATERIAL AS A SOURCE OF DREAMS

Like every other writer on the subject, with the exception of Robert, I [189]
have pointed out as a third peculiarity of the content of dreams that it may include impressions which date back to earliest childhood, and which seem not to be accessible to waking memory. It is naturally hard to determine how rarely or how frequently this occurs, since the origin of the dream elements in question is not recognized after waking. Proof that what we are dealing with are impressions from childhood must therefore be established by external evidence and there is seldom an opportunity for doing this. A particularly convincing example is that given by Maury [1878, 143 f., quoted on p. 15 above] of the man who determined one day to revisit his old home after an absence of more than twenty years. During the night before his departure he dreamt that he was in a totally unknown place and there met an unknown man in the street and had a conversation with him. When he reached his home, he found that the unknown place was a real one in the immediate neighbourhood of his native town, and the unknown man in the dream turned out to be a friend of his dead father's who was still living there. This was conclusive evidence that he had seen both the man and the place in his childhood. This dream is also to be interpreted as a dream of impatience like that of the girl with the concert ticket in her pocket (p. 135 f.), that of the child whose father had promised to take her on an excursion to the Hameau (cf. p. 115), and similar ones. The motives which led the dreamers to reproduce one particular impression from their childhood rather than any other cannot, of course, be discovered without an analysis.

Someone who attended a course of lectures of mine and boasted that his dreams very seldom underwent distortion reported to me that not long before he had dreamt of seeing *his former tutor in bed with the nurse* who had been with his family till his eleventh year. In the dream he had identified the locality where the scene occurred. His interest had been aroused and he had reported the dream to his elder brother, who had laughingly confirmed the truth of what he had dreamt. His brother [190]
remembered it very well, as he had been six years old at the time. The lovers had been in the habit of making the elder boy drunk with beer,

whenever circumstances were favourable for intercourse during the night. The younger boy – the dreamer – who was then three years old and slept in the room with the nurse, was not regarded as an impediment. [See also p. 175 below.]

There is another way in which it can be established with certainty without the assistance of interpretation that a dream contains elements from childhood. This is where the dream is of what has been called the 'recurrent' type: that is to say, where a dream was first dreamt in childhood and then constantly reappears from time to time during adult sleep.[1] I am able to add to the familiar examples of such dreams a few from my own records, though I have never myself experienced one. A physician in his thirties told me that from the earliest days of his childhood to the present time a yellow lion frequently appeared in his dreams; he was able to give a minute description of it. This lion out of his dreams made its appearance one day in bodily form, as a china ornament that had long disappeared. The young man then learnt from his mother that this object had been his favourite toy during his early childhood, though he himself had forgotten the fact.[2]

If we turn now from the manifest content of dreams to the dream
[191] thoughts which only analysis uncovers, we find to our astonishment that experiences from childhood also play a part in dreams whose content would never have led one to suppose it. I owe a particularly agreeable and instructive example of a dream of this kind to my respected colleague of the yellow lion. After reading Nansen's narrative of his polar expedition, he had a dream of being in a field of ice and of giving the gallant explorer galvanic treatment for an attack of sciatica from which he was suffering. In the course of analysing the dream, he thought of a story dating from his childhood, which alone, incidentally, made the dream intelligible. One day, when he was a child of three or four, he had

1 [See above, p. 40 *n*. Some remarks on 'recurrent' dreams can be found in Freud's 'Fragment of an Analysis of a Case of Hysteria' (1905*e*), at the end of the synthesis of 'Dora's' first dream (Section II), *RSE*, **7**, 82–3. Cf. below, p. 518 *n*.]

2 [The following further dream appeared at this point in the first edition (1900) only. A note in *GS*, **3** (1925), 38, remarks that it was rightly omitted in all subsequent editions: 'Dreams of this sort are of a *typical* character and correspond not to memories but to phantasies, whose meaning it is not hard to guess.' Here are the cancelled sentences: 'One of my women patients dreamt the same dream – a scene filled with anxiety – four or five times during her thirty-eighth year. She was being pursued, fled into a room, shut the door, and then opened it again to take out the key, which was on the outside of the door. She had a feeling that if she failed something frightful would happen. She got hold of the key, locked the door from the inside and gave a sigh of relief. I cannot say to what age we should assign this little scene, in which, of course, she had only played the part of an audience.']

heard the grown-ups talking of voyages of discovery and had asked his father whether that was a serious illness. He had evidently confused '*Reisen*' ['voyages'] with '*Reissen*' ['gripes'], and his brothers and sisters saw to it that he never forgot this embarrassing mistake.

There was a similar instance of this when, in the course of my analysis of the dream of the monograph on the genus Cyclamen [see above, p. 152], I stumbled upon the childhood memory of my father, when I was a boy of five, giving me a book illustrated with coloured plates to destroy. It may perhaps be doubted whether this memory really had any share in determining the form taken by the content of the dream or whether it was not rather that the process of analysis built up the connection subsequently [*nachträglich*]. But the copious and intertwined associative links warrant our accepting the former alternative: cyclamen – favourite flower – favourite food – artichokes; pulling to pieces like an artichoke, leaf by leaf (a phrase constantly ringing in our ears in relation to the piecemeal dismemberment of the Chinese Empire) – herbarium – bookworms, whose favourite food is books. Moreover, I can assure my readers that the ultimate meaning of the dream, which I have not disclosed, is intimately related to the subject of the childhood scene.

In the case of another group of dreams, analysis shows us that the actual wish which instigated the dream, and the fulfilment of which is represented by the dream, is derived from childhood; so that, to our surprise, *we find the child and the child's impulses still living on in the dream*.

At this point I shall once more take up the interpretation of a dream which we have already found instructive – the dream of my friend R. being my uncle. [See p. 122 ff. above.] We have followed its interpretation to the point of recognizing clearly as one of its motives my wish to be appointed to a professorship; and we explained the affection I felt in the dream for my friend R. as a product of opposition and revolt against the slanders upon my two colleagues which were contained in the dream thoughts. The dream was one of my own; I may therefore continue its analysis by saying that my feelings were not yet satisfied by the solution that had so far been reached. I knew that my waking judgement upon the colleagues who were so ill used in the dream thoughts would have been a very different one; and the force of my wish not to share their fate in the matter of the appointment struck me as insufficient to explain the contradiction between my waking and dreaming estimates of them. If it was indeed true that my craving to be addressed with a different title was as strong as all that, it showed a pathological ambition which [192]

I did not recognize in myself and which I believed was alien to me. I could not tell how other people who believed they knew me would judge me in this respect. It might be that I was really ambitious; but, if so, my ambition had long ago been transferred to objects quite other than the title and rank of *professor extraordinarius*.

What, then, could have been the origin of the ambitiousness which produced the dream in me? At that point I recalled an anecdote I had often heard repeated in my childhood. At the time of my birth an old peasant woman had prophesied to my proud mother that with her first-born child she had brought a great man into the world. Prophecies of this kind must be very common: there are so many mothers filled with happy expectations and so many old peasant women and others of the kind who make up for the loss of their power to control things in the present world by concentrating it on the future. Nor can the prophetess have lost anything by her words. Could this have been the source of my thirst for grandeur? But that reminded me of another experience, dating from my later childhood, which provided a still better explanation. My parents had been in the habit, when I was a boy of eleven or twelve, of taking me with them to the Prater.[1] One evening, while we were sitting in a restaurant there, our attention had been attracted by a man who
[193] was moving from one table to another and, for a small consideration, improvising a verse upon any topic presented to him. I was despatched to bring the poet to our table and he showed his gratitude to the messenger. Before enquiring what the chosen topic was to be, he had dedicated a few lines to myself; and he had been inspired to declare that I should probably grow up to be a cabinet minister. I still remembered quite well what an impression this second prophecy had made on me. Those were the days of the '*Bürger*' Ministry.[2] Shortly before, my father had brought home portraits of these middle-class professional men – Herbst, Giskra, Unger, Berger and the rest – and we had illuminated the house in their honour. There had even been some Jews among them. So henceforth every industrious Jewish schoolboy carried a cabinet minister's portfolio in his satchel. The events of that period no doubt had some bearing on the fact that up to a time shortly before I entered the university it had been my intention to study law; it was only at the last moment that I changed my mind. A ministerial career is definitely barred to a medical man. But now to return to my dream. It began to dawn on

1 [The famous park on the outskirts of Vienna.]

2 [The 'Middle-Class Ministry' – a government of liberal complexion, elected after the new Austrian constitution was established in 1867.]

me that my dream had carried me back from the dreary present to the cheerful hopes of the days of the '*Bürger*' Ministry, and that the wish that it had done its best to fulfil was one dating back to those times. In mishandling my two learned and eminent colleagues because they were Jews, and in treating the one as a simpleton and the other as a criminal, I was behaving as though I were the minister, I had put myself in the minister's place. Turning the tables on His Excellency with a vengeance! He had refused to appoint me *professor extraordinarius* and I had retaliated in the dream by stepping into his shoes.[1]

In another instance it became apparent that, though the wish which instigated the dream was a present-day one, it had received a powerful reinforcement from memories that stretched far back into childhood. What I have in mind is a series of dreams which are based upon a longing to visit Rome. For a long time to come, no doubt, I shall have to continue to satisfy that longing in my dreams: for at the season of the [194]
year when it is possible for me to travel, residence in Rome must be avoided for reasons of health.[2] For instance, I dreamt once that I was looking out of a railway-carriage window at the Tiber and the Ponte Sant' Angelo. The train began to move off, and it occurred to me that I had not so much as set foot in the city. The view that I had seen in my dream was taken from a well-known engraving which I had caught sight of for a moment the day before in the sitting room of one of my patients. Another time someone led me to the top of a hill and showed me Rome half-shrouded in mist; it was so far away that I was surprised at my view of it being so clear. There was more in the content of this dream than I feel prepared to detail; but the theme of 'the promised land seen from afar' was obvious in it. The town which I saw in this way for the first time, shrouded in mist, was – Lübeck, and the prototype of the hill was – at Gleichenberg.[3] In a third dream I had at last got to Rome, as the dream itself informed me; but I was disappointed to find that the scenery was far from being of an urban character. *There was a narrow stream of dark water; on one side of it were black cliffs and on the other*

1 [In an amusing letter to Fliess of March 11, 1902 (Freud, 1950*a*, Letter 152), Freud tells the story of how he came actually to be appointed to a professorship, two years after the publication of this book.]

2 [*Footnote added* 1909:] I discovered long since that it only needs a little courage to fulfil wishes which till then have been regarded as unattainable; [*added* 1925:] and thereafter became a constant pilgrim to Rome. [The correspondence with Fliess (Freud, 1950*a*) gives repeated evidence of the emotional importance to Freud of the idea of visiting Rome. He first fulfilled this wish in the summer of 1901 (Letter 146).]

3 [An Austrian spa in Styria, not far from Graz.]

meadows with big white flowers. I noticed a Herr Zucker (whom I knew slightly) *and determined to ask him the way to the city*. I was clearly making a vain attempt to see in my dream a city which I had never seen in my waking life. Breaking up the landscape in the dream into its elements, I found that the white flowers took me to Ravenna, which I have visited and which, for a time at least, superseded Rome as capital of Italy. In the marshes round Ravenna we found the loveliest water-lilies growing in black water. Because we had had such difficulty in picking them out of the water, the dream made them grow in meadows like the narcissi at our own Aussee. The dark cliff, so close to the water, reminded me vividly of the valley of the Tepl near Karlsbad. '*Karlsbad*' enabled me to explain the curious detail of my having asked Herr Zucker the way. The material out of which the dream was woven included at this
[195] point two of those facetious Jewish anecdotes which contain so much profound and often bitter worldly wisdom and which we so greatly enjoy quoting in our talk and letters.[1] Here is the first one: the '*constitution*' story. An impecunious Jew had stowed himself away without a ticket on the fast train to *Karlsbad*. He was caught, and each time tickets were inspected he was taken off of the train and treated more and more severely. At one of the stations on his *via dolorosa* he met an acquaintance, who asked him where he was travelling to. 'To Karlsbad,' was his reply, 'if my constitution can stand it.' My memory then passed on to another story: of a Jew who could not speak French and had been recommended when he was in Paris to ask the way to the rue Richelieu. Paris itself had for so many long years been another goal of my longings; and the blissful feelings with which I first set foot on its pavement seemed to me a guarantee that others of my wishes would be fulfilled as well. 'Asking the way', moreover, was a direct allusion to *Rome*, since it is well known that all roads lead there. Again, the name *Zucker* [sugar] was once more an allusion to *Karlsbad*; for we are in the habit of prescribing treatment there for anyone suffering from the *constitutional* complaint of diabetes.[2] The instigation to this dream had been a proposal made by my friend in Berlin that we should meet in Prague at Easter. What we were going to discuss there would have included something with a further connection with 'sugar' and 'diabetes'.

A fourth dream, which occurred soon after the last one, took me to Rome once more. I saw a street corner before me and was surprised to

1 [In a letter to Fliess of June 12, 1897 (Freud, 1950*a*, Letter 65), Freud mentions that he is making a collection of these anecdotes, of which he was to make great use in his book on *Jokes* (Freud, 1905*c*). The first of the present anecdotes is alluded to more than once in his letters, and Rome and Karlsbad come to be identified as symbols of unattainable aims (e.g. in Letters 112 and 130).]

2 [The German word for 'diabetes' is '*Zuckerkrankheit*' ('sugar disease').]

find so many posters in German stuck up there.[1] I had written to my friend with prophetic foresight the day before to say that I thought Prague might not be an agreeable place for a German to walk about in. Thus the dream expressed at the same time a wish to meet him in Rome instead of in a Bohemian town, and a desire, probably dating back to [196] my student days, that the German language might be better tolerated in Prague. Incidentally, I must have understood Czech in my earliest childhood, for I was born in a small town in Moravia which has a Slav population. A Czech nursery rhyme, which I heard in my seventeenth year, printed itself on my memory so easily that I can repeat it to this day, though I have no notion what it means. Thus there was no lack of connections with my early childhood in these dreams either.

It was on my last journey to Italy, which, among other places, took me past Lake Trasimene, that finally – after having seen the Tiber and sadly turned back when I was only fifty miles from Rome – I discovered the way in which my longing for the eternal city had been reinforced by impressions from my youth. I was in the act of making a plan to bypass Rome next year and travel to Naples, when a sentence occurred to me which I must have read in one of our classical authors:[2] 'Which of the two, it may be debated, walked up and down his study with the greater impatience after he had formed his plan of going to Rome – Winckelmann, the vice-principal, or Hannibal, the commander-in-chief?' I had actually been following in Hannibal's footsteps. Like him, I had been fated not to see Rome; and he too had moved into the Campagna when everyone had expected him in Rome. But Hannibal, whom I had come to resemble in these respects, had been the favourite hero of my later schooldays. Like so many boys of that age, I had sympathized in the Punic Wars not with the Romans but with the Carthaginians. And when in the higher classes I began to understand for the first time what it meant to belong to an alien race, and anti-Semitic feelings among the other boys warned me that I must take up a definite position, the figure of the Semitic general rose still higher in my esteem. To my youthful mind Hannibal and Rome symbolized the conflict between the tenacity of Jewry and the organization of the Catholic Church. And the increasing importance of the effects of the anti-Semitic movement upon our

1 [This dream is discussed in a letter to Fliess of December 3, 1897 (Freud, 1950*a*, Letter 77). The meeting in Prague was probably in the early part of the same year (see Letter 58, of February 8, 1897).]

2 [*Footnote added* 1925:] The author in question must no doubt have been Jean Paul. – [His decision to visit Rome was the turning point in the career of Winckelmann, the eighteenth-century founder of classical archaeology.]

emotional life helped to fix the thoughts and feelings of those early days.
[197] Thus the wish to go to Rome had become in my dream life a cloak and symbol for a number of other passionate wishes. Their realization was to be pursued with all the perseverance and single-mindedness of the Carthaginian, though their fulfilment seemed at the moment just as little favoured by destiny as was Hannibal's lifelong wish to enter Rome.

At that point I was brought up against the event in my youth whose power was still being shown in all these emotions and dreams. I may have been ten or twelve years old, when my father began to take me with him on his walks and reveal to me in his talk his views upon things in the world we live in. Thus it was, on one such occasion, that he told me a story to show me how much better things were now than they had been in his days. 'When I was a young man', he said, 'I went for a walk one Saturday in the streets of your birthplace; I was well dressed, and had a new fur cap on my head. A Christian came up to me and with a single blow knocked off my cap into the mud and shouted: "Jew! get off the pavement!"' 'And what did you do?' I asked. 'I went into the roadway and picked up my cap,' was his quiet reply. This struck me as unheroic conduct on the part of the big, strong man who was holding the little boy by the hand. I contrasted this situation with another which fitted my feelings better: the scene in which Hannibal's father, Hamilcar Barca,[1] made his boy swear before the household altar to take vengeance on the Romans. Ever since that time Hannibal had had a place in my phantasies.

I believe I can trace my enthusiasm for the Carthaginian general a step further back into my childhood; so that once more it would only have been a question of a transference [*Übertragung*] of an already formed emotional relation on to a new object. One of the first books that I got hold of when I had learnt to read was Thiers' history of the Consulate and Empire. I can still remember sticking labels on the flat backs of my wooden soldiers with the names of Napoleon's marshals written on them. And at that time my declared favourite was already
[198] Masséna (or to give the name its Jewish form, Manasseh).[2] (No doubt this preference was also partly to be explained by the fact that my birthday fell on the same day as his, exactly a hundred years later.)[3] Napoleon himself lines up with Hannibal owing to their both having crossed the

1 [*Footnote added* 1909:] In the first edition the name of Hasdrubal appeared instead: a puzzling mistake, which I have explained in my *Psychopathology of Everyday Life* (1901*b*), Chapter X (2).

2 [*Footnote added* 1930:] Incidentally, doubts have been thrown on the marshal's Jewish origin.

3 [This sentence was added in 1914.]

Alps. It may even be that the development of this martial ideal is traceable still further back into my childhood: to the times when, at the age of three, I was in a close relation, sometimes friendly but sometimes warlike, with a boy a year older than myself, and to the wishes which that relation must have stirred up in the weaker of the two playfellows.[1]

The deeper one carries the analysis of a dream, the more often one comes upon the track of experiences in childhood which have played a part among the sources of that dream's latent content.

We have already seen (on p. 18 f.) that a dream very seldom reproduces recollections in such a way that they constitute, without abbreviation or modification, the *whole* of its manifest content. Nevertheless, there are some undoubted instances of this happening: and I can add a few more, relating, once more, to childhood scenes. One of my patients was presented in a dream with an almost undistorted reproduction of a sexual episode, which was at once recognizable as a true recollection. His memory of the event had, in fact, never been completely lost in waking life, though it had become greatly obscured, and its revival was a consequence of work previously done in analysis. At the age of twelve, the dreamer had gone to visit a schoolfriend who was laid up in bed, when the latter, by what was probably an accidental movement, uncovered his body. At the sight of his friend's genitals, my patient had been overcome by some sort of compulsion and had uncovered himself too and caught hold of the other's penis. His friend looked at him with indignation and astonishment; whereupon, overcome by embarrassment, he let go. This scene was repeated in a dream twenty-three years later, including all the details of his feelings at the time. It was modified, however, to this extent, that the dreamer assumed the passive instead of the active role, while the figure of his schoolfriend was replaced with someone belonging to his contemporary life. [See also p. 167 above.]

It is true that as a rule the childhood scene is only represented in the [199]
dream's manifest content by an allusion, and has to be arrived at by an interpretation of the dream. Such instances, when they are recorded, cannot carry much conviction, since as a rule there is no other evidence of these childhood experiences having occurred: if they date back to a very early age they are no longer recognized as memories. The general justification for inferring the occurrence of these childhood experiences from dreams is provided by a whole number of factors in psychoanalytic

1 [A fuller account of this can be found on pp. 379 and 432 f. below.]

work, which are mutually consistent and thus seem sufficiently trustworthy. If I record some of these inferred childhood experiences torn from their context for the purposes of dream interpretation, they may perhaps create little impression, especially as I shall not even be able to quote all the material on which the interpretations were based. Nevertheless, I shall not allow this to deter me from relating them.

I

All the dreams of one of my women patients were characterized by her being 'rushed': she would be in a violent rush to get somewhere in time not to miss a train, and so on. In one dream *she was going to call on a woman friend; her mother told her to take a cab and not to walk; but she ran instead and kept on falling down*. – The material which came up in analysis led to memories of *rushing* about and romping as a child (you know what the Viennese call '*eine Hetz*' ['a rush', 'a mad race']). One particular dream recalled the favourite children's game of saying a sentence '*Die Kuh rannte, bis sie fiel*' ['The cow ran till it fell'] so quickly that it sounds as though it were a single [nonsensical] word – another *rush* in fact. All these innocent rushings-about with little girl friends were remembered because they took the place of other, less innocent ones.

II

Here is another woman patient's dream: *She was in a big room in which all sorts of machines were standing, like what she imagined an orthopaedic institute to be. She was told I had no time and that she must have her treatment at the same time as five others. She refused, however, and would not lie down in the bed – or whatever it was – that was meant for her. She stood in the corner and waited for me to say it wasn't true. Meanwhile the others were laughing at her and saying it was just her way of 'carrying on'. – Simultaneously, it was as though she was making a lot of small squares*.

[200] The first part of the content of this dream related to the treatment and was a transference on to me. The second part contained an allusion to a scene in childhood. The two parts were linked together by the mention of the bed.

The *orthopaedic institute* referred back to a remark I had made in which I had compared the treatment, alike in its length and in its nature,

to an *orthopaedic* one. When I started her treatment I had been obliged to tell her that for the time being *I had not much time for her*, though later I should be able to give her a whole hour daily. This had stirred up her old sensitiveness, which is a principal trait in the character of children inclined to hysteria: they are insatiable for love. My patient had been the youngest of a family of six children (hence: *at the same time as five others*) and had therefore been her father's favourite; but even so she seems to have felt that her adored father devoted too little of his time and attention to her. – Her *waiting for me to say it wasn't true* had the following origin. A young tailor's apprentice had brought her a dress and she had given him the money for it. Afterwards she had asked her husband whether if the boy lost the money she would have to pay it over again. Her husband, to *tease* her, had said that was so. (The *teasing* in the dream.) She kept on asking over and over again and *waited for him to say after all it wasn't true*. It was then possible to infer that in the latent content of the dream she had had a thought of whether she would have to pay me twice as much if I gave her twice as much time – a thought which she felt was avaricious or *filthy*. (Uncleanliness in childhood is often replaced in dreams with avariciousness for money; the link between the two is the word 'filthy'.[1]) If the whole passage about *waiting for me to say*, etc., was intended in the dream as a circumlocution for the word 'filthy', then her '*standing in the corner*' and '*not lying down in the bed*' would fit in with it as constituents of a scene from her childhood: a scene in which she had dirtied her bed and been punished by being made to stand in the corner, with a threat that her father would not love her any more and her brothers and sisters would laugh at her, and so on. – The *small squares* related to her little niece, who had shown her the arithmetical trick of arranging the digits in nine squares (I believe this is correct) so that they add up in all directions to fifteen.

III

A man dreamt as follows: *He saw two boys struggling – barrelmaker's* [201]
boys, to judge by the implements lying around. One of the boys threw the other down; the boy on the ground had ear-rings with blue stones. He hurried towards the offender with his stick raised, to chastise him. The latter fled for protection to a woman, who was standing by a wooden

1 [This point was later enlarged upon by Freud (1908*b*), *RSE*, **9**. But it already occurs in a letter to Fliess of December 22, 1897 (Freud, 1950*a*, Letter 79).]

fence, as though she was his mother. She was a woman of the working classes and her back was turned to the dreamer. At last she turned round and gave him a terrible look so that he ran off in terror. The red flesh of the lower lids of her eyes could be seen standing out.

The dream had made copious use of trivial events of the previous day. He had, in fact, seen two boys in the street, one of whom threw the other down. When he hurried up to stop the fight they had both taken to their heels. – *Barrelmaker's boys*. This was only explained by a subsequent dream in which he used the phrase '*knocking the bottom out of a barrel*'. – From his experience he believed that *ear-rings with blue stones* were mostly worn by prostitutes. A line from a well-known piece of doggerel about *two boys* then occurred to him: 'The other boy was called Marie' (i.e. was a girl). – *The woman standing*. After the scene with the two boys he had gone for a walk along the bank of the Danube and had profited by the loneliness of the spot to micturate against *a wooden fence*. Further on, a respectably dressed elderly lady had smiled at him in a very friendly manner and had wanted to give him her visiting card. Since the woman in the dream was standing in the same position as he had been in when he was micturating, it must have been a question of a micturating woman. This tallies with her terrible *look* and the *red flesh standing out*, which could only relate to the gaping of the genitals caused by stooping. This, seen in his childhood, reappeared in later memory as '*proud flesh*' – as a wound.

The dream combined two opportunities he had had as a little boy of seeing little girls' genitals: when they were *thrown down* and when they were *micturating*. And from the other part of the context it emerged that he had a recollection of being *chastised* or threatened by his father for the sexual curiosity he had evinced on these occasions.

IV

[202] Behind the following dream (dreamt by an elderly lady) there lay a whole quantity of childhood memories, combined, as best they might be, into a single phantasy.

She went out in a violent rush to do some commissions. In the Graben[1] *she sank down on her knees, as though she was quite broken down. A large number of people collected round her, especially cab drivers* [*Fiakerkutscher*]*; but no-one helped her up. She made several vain attempts, and she must at last have succeeded, for she was put into a cab*

1 [One of the principal shopping centres in Vienna.]

which was to take her home. Someone threw a big, heavily laden basket (like a shopping basket) in through the window after her.

This was the same lady who always felt 'rushed' in her dreams, just as she had rushed and romped about when she was a child. [See above, p. 176.] The first scene in the dream was evidently derived from the sight of a horse fallen down; in the same way the words '*broken down*' referred to horseracing. In her youth she had ridden horses, and no doubt when she was still younger she had actually *been* a horse. The *falling down* was related to a memory from very early childhood of the seventeen-year-old son of the house porter who had fallen down in the street in an epileptic fit and been brought home in a carriage. She had of course only *heard* about this, but the idea of epileptic fits (of the '*falling* sickness') had obtained a hold on her imagination and had later influenced the form taken by her own hysterical attacks. – If a woman dreams of falling, it almost invariably has a sexual sense: she is imagining herself as a '*fallen woman*'. The present dream in particular scarcely left any room for doubt, since the place where my patient fell was the Graben, a part of Vienna notorious as a promenade for prostitutes. The *shopping basket* [*Korb*] led to more than one interpretation. It reminded her of the numerous *rebuffs* [*Körbe*][1] which she had dealt out to her suitors, as well as of those which she complained of having later received herself. This also connected with the fact that *no-one helped her up*, which she herself explained as a rebuff. The *shopping basket* further reminded her of phantasies which had already come up in her analysis, in which she was married far beneath her and had to go marketing herself. And lastly it might serve as the mark of a servant. At this point further childhood recollections emerged. First, of a cook who had been dismissed for stealing, and who had *fallen on her knees* and begged to [203] be forgiven. She herself had been twelve at the time. Then, of a housemaid who had been dismissed on account of a love affair with the family *coachman* [*Kutscher*] (who incidentally married her subsequently). Thus this memory was also one of the sources of the *drivers* (coachmen)[2] in the dream (who, in contradistinction to the actual coachman, failed to raise the fallen woman). There remained to be explained the fact of the basket being *thrown in after her* and *through the window*. This reminded her of *handing in* luggage to be *sent off* by rail, of the country custom of lovers climbing in through their sweethearts' *window*, and of other little episodes from her life in the country: how a gentleman had thrown some *blue plums* to a lady *through the window* of her room, and how

1 [The word '*Korb*' ('basket') is commonly used for the rejection of an offer of marriage.]

2 [The German word is the same (*Kutscher*) in both cases.]

her own younger sister had been scared by the village idiot looking in *through her window*. An obscure memory from her tenth year then began to emerge, of a nurse in the country who had had love scenes (which the girl might have seen something of) with one of the servants in the house and who, along with her lover, had been *sent off, thrown out* (the opposite of the dream image '*thrown in*') – a story that we had already approached from several other directions. A servant's luggage or trunk is referred to contemptuously in Vienna as 'seven *plums*': 'pack up your seven plums and out you go!'

My records naturally include a large collection of patients' dreams the analysis of which led to obscure or entirely forgotten impressions of childhood, often going back to the first three years of life. But it would be unsafe to apply any conclusions drawn from them to dreams in general. The persons concerned were in every instance neurotics and in particular hysterics; and it is possible that the part played by childhood scenes in their dreams might be determined by the nature of their neurosis and not by the nature of dreams. Nevertheless, in analysing my own dreams – and, after all, I am not doing so on account of any gross pathological symptoms – it happens no less frequently that in the latent content of a dream I come unexpectedly upon a scene from childhood, and that all at once a whole series of my dreams link up with the associations branching out from some experience of my childhood. I have
[204] already given some instances of this [pp. 170–5 above], and I shall have others to give in a variety of connections. I cannot, perhaps, bring this section to a better close than by reporting one or two dreams of mine in which recent occasions and long-forgotten experiences of childhood came together as sources of the dream.

I

Tired and hungry after a journey, I went to bed, and the major vital needs began to announce their presence in my sleep; I dreamt as follows:

I went into a kitchen in search of some pudding. Three women were standing in it; one of them was the hostess of the inn and was twisting something about in her hand, as though she was making Knödel [*dumplings*]. *She answered that I must wait till she was ready.* (These were not definite spoken words.) *I felt impatient and went off with a sense of injury. I put on an overcoat. But the first I tried on was too long*

for me. I took it off, rather surprised to find it was trimmed with fur. A second one that I put on had a long strip with a Turkish design let into it. A stranger with a long face and a short pointed beard came up and tried to prevent my putting it on, saying it was his. I showed him then that it was embroidered all over with a Turkish pattern. He asked: 'What have the Turkish (designs, stripes . . .) to do with you?' But we then became quite friendly with each other.

When I began analysing this dream, I thought quite unexpectedly of the first novel I ever read (when I was thirteen, perhaps); as a matter of fact I began at the end of the first volume. I have never known the name of the novel or of its author; but I have a vivid memory of its ending. The hero went mad and kept calling out the names of the three women who had brought the greatest happiness and sorrow into his life. One of these names was *Pélagie*. I still had no notion what this recollection was going to lead to in the analysis. In connection with the three women I thought of the three Fates who spin the destiny of man, and I knew that one of the three women – the inn hostess in the dream – was the mother who gives life, and furthermore (as in my own case) gives the living creature its first nourishment. Love and hunger, I reflected, meet at a woman's breast. A young man who was a great admirer of feminine beauty was talking once – so the story went – of the good-looking wet-nurse who had suckled him when he was a baby: 'I'm sorry', he remarked, 'that I didn't make a better use of my opportunity.' I was in the habit of quoting this anecdote to explain the factor of 'deferred action' [*Nachträglichkeit*][T] in the mechanism of the psychoneuroses.[I] – One of the Fates, then, was rubbing the palms of her hands together as though she was making dumplings: a peculiar occupation for a Fate, and one that cried out for an explanation. This was provided by another and earlier memory of my childhood. When I was six years old and was given my first lessons by my mother, I was expected to believe that we were all made of earth and must therefore return to earth. This did not suit me and I expressed doubts of the doctrine. My mother thereupon rubbed the palms of her hands together – just as she did in making dumplings, except that there was no dough between them – and showed me the blackish scales of *epidermis* produced by the friction as a proof that we were made of earth. My astonishment at this ocular demonstration knew no bounds and I acquiesced in the belief which I was later to [205]

1 [A reference to a superseded theory of the mechanism of hysteria, described in the later sections of Part II of Freud's early 'Project for a Scientific Psychology' (Freud, 1950*a*).]

hear expressed in the words: '*Du bist der Natur einen Tod schuldig*.'[1] So they really were Fates that I found in the kitchen when I went into it – as I had so often done in my childhood when I was hungry, while my mother, standing by the fire, had admonished me that I must wait till dinner was ready. – And now for the dumplings – the *Knödel*! One at least of my teachers at the university – and precisely the one to whom I owe my histological knowledge (for instance of the *epidermis*) – would infallibly be reminded by the name *Knödl* of a person against whom he had been obliged to take legal action for *plagiarizing* his writings. The idea of plagiarizing – of appropriating whatever one can, even though it belongs to someone else – clearly led on to the second part of the dream, in which I was treated as though I were the thief who had for some time carried on his business of stealing overcoats in the lecture rooms. I had written down the word 'plagiarizing', without thinking
[206] about it, because it occurred to me; but now I noticed that it could form a bridge [*Brücke*] between different pieces of the dream's manifest content. A chain of associations (*Pélagie – plagiarizing – plagiostomes*[2] or sharks [*Haifische*] – *a fish's swimming bladder* [*Fischblase*]) connected the old novel with the case of Knödl and with the overcoats, which clearly referred to implements used in sexual technique [see p. 164 f. above]. (Cf. Maury's alliterative dreams [on p. 52 f.].) No doubt it was a very far-fetched and senseless chain of thought; but I could never have constructed it in waking life unless it had already been constructed by the dream-work. And, as though the need to set up forced connections regarded *nothing* as sacred, the honoured name of Brücke[3] (cf. the verbal *bridge* above) reminded me of the institute in which I spent the happiest hours of my student life, free from all other desires –

> So wird's Euch an der Weisheit *Brüsten*
> Mit jedem Tage mehr geltüsten[4]

1 ['Thou owest Nature a death.' Evidently a reminiscence of Prince Hal's remark to Falstaff in *Henry IV*, *Part I*, Scene V, Act 1: 'Thou owest God a death.' Freud uses the same words and ascribes them to Shakespeare in a letter to Fliess of February 6, 1899 (Freud, 1950*a*, Letter 104). See also *RSE*, **14**, 288 *n.* 2.] – Both of the emotions that were attached to these childhood scenes – astonishment and submission to the inevitable – had occurred in a dream which I had had shortly before this one and which had first reminded me of this event in my childhood.

2 I have deliberately avoided enlarging upon the plagiostomes; they reminded me of an unpleasant occasion on which I had disgraced myself in connection with this same university teacher.

3 [For Brücke and Fleischl (below) see footnote 1, p. 431.]

4 ['Thus, at the *breasts* of Wisdom clinging,
Thou'lt find each day a greater rapture bringing.'
Goethe, *Faust*, Part I, [Scene 4] (Bayard Taylor's translation).]

– in complete contrast to the desires which were now *plaguing* me in my dreams. Finally there came to mind another much respected teacher – his name, Fleischl ['*Fleisch*' = 'meat'], like Knödl, sounded like something to eat – and a distressing scene in which *scales of epidermis* played a part (my mother and the inn hostess) as well as *madness* (the novel) and a drug from the dispensary[1] which removes *hunger*: cocaine.

I might pursue the intricate trains of thought further along these lines and explain fully the part of the dream which I have not analysed; but I must desist at this point because the personal sacrifice demanded would be too great. I will pick out only one thread, which is qualified to lead us straight to one of the dream thoughts underlying the confusion. The stranger with the long face and pointed beard who tried to prevent my putting on the overcoat bore the features of a shopkeeper at Spalato from whom my wife had bought a quantity of *Turkish* stuffs. [207] He was called Popović, an equivocal name,[2] on which a humorous writer, Stettenheim, has already made a suggestive comment: 'He told me his name and blushingly pressed my hand.' Once again I found myself misusing a name, as I already had done with Pélagie, Knödl, Brücke and Fleischl. It could scarcely be denied that playing about with names like this was a kind of childish naughtiness. But if I indulged in it, it was as an act of retribution; for my own name had been the victim of feeble witticisms like these on countless occasions.[3] Goethe, I recalled, had remarked somewhere upon people's sensitiveness about their names: how we seem to have grown into them like our *skin*. He had said this *à propos* of a line written on his name by Herder:

> 'Der du von Göttern abstammst, von Gothen oder vom Kote.' –
> 'So seid ihr Götterbilder auch zu Staub.'[4]

I noticed that my digression on the subject of the misuse of names was only leading up to this complaint. But I must break off here. – My wife's purchase made at Spalato reminded me of another purchase, made at Cattaro,[5] over which I had been too cautious, so that I had

1 [In German '*lateinische Küche*' (literally 'Latin kitchen'). – Cf. footnote 2, p. 99 above.]

2 ['*Popo*' is a childish word for 'bottom'.]

3 ['*Freud*' is the German word for 'joy'.]

4 [The first of these lines comes from a facetious note written by Herder to Goethe with a request for the loan of some books: 'Thou who art the offspring of gods or of Goths or of dung – (Goethe, send them to me!)' The second line, a further free association of Freud's, is taken from the well-known recognition scene in Goethe's *Iphigenie auf Tauris*. Iphigenia, hearing from Pylades of the death of so many heroes during the siege of Troy, exclaims: 'So you too, divine figures, have turned to dust!' (Act II, Sc. 2.)]

5 [Spalato and Cattaro: both towns on the Dalmatian coast.]

lost an opportunity of making some nice acquisitions. (Cf. the neglected opportunity with the wet-nurse.) For one of the thoughts which my hunger introduced into the dream was this: 'One should never neglect an opportunity, but always take what one can even when it involves doing a small wrong. One should never neglect an opportunity, since life is short and death inevitable.' Because this lesson of '*carpe diem*'[1] had among other meanings a sexual one, and because the desire it expressed did not stop short of doing wrong, it had reason to dread
[208] the censorship and was obliged to conceal itself behind a dream. All kinds of thoughts having a *contrary* sense then found voice: memories of a time when the dreamer was content with *spiritual* food, restraining thoughts of every kind and even threats of the most revolting sexual punishments.

II

The next dream calls for a rather long preamble:

I had driven to the Western Station [in Vienna] to take the train for my summer holiday at Aussee, but had arrived on the platform while an earlier train, going to Ischl, was still standing in the station. There I had seen Count Thun[2] who was once again travelling to Ischl for an audience with the Emperor. Though it was raining, he had arrived in an open carriage. He had walked straight in through the entrance for the local trains. The ticket inspector at the gate had not recognized him and had tried to take his ticket, but he had waved the man aside with a curt motion of his hand and without giving any explanation. After the train for Ischl had gone out, I ought by rights to have left the platform again and returned to the waiting room; and it had cost me some trouble to arrange matters so that I was allowed to stop on the platform. I had passed the time in keeping a look-out to see if anyone came along and tried to get a reserved compartment by exercising some sort of 'pull'. I had intended in that case to make a loud protest: that is to say, to claim equal rights. Meantime I had been humming a tune to myself which I recognized as Figaro's aria from *Le Nozze di Figaro*:

1 [Horace, *Odes*, I, xi, 8.]

2 [Austrian politician (1847–1916) of reactionary views; an upholder of Bohemian self-government as against the German nationalists; Austrian premier 1898–9. – Bad Ischl, in Upper Austria, where the Court regularly spent the summer months.]

Se vuol ballare, signor contino,
Se vuol ballare, signor contino,
Il chitarino le suonerò[1]

(It is a little doubtful whether anyone else would have recognized the tune.)

The whole evening I had been in high spirits and in a combative mood. I had chaffed my waiter and my cab driver – without, I hope, [209] hurting their feelings. And now all kinds of insolent and revolutionary ideas were going through my head, in keeping with Figaro's words and with my recollections of Beaumarchais' comedy which I had seen acted by the Comédie Française. I thought of the phrase about the great gentlemen who had taken the trouble to be born, and of the *droit du seigneur* which Count Almaviva tried to exercise over Susanna. I thought, too, of how our malicious opposition journalists made jokes over Count Thun's name, calling him instead 'Count Nichtsthun'.[2] Not that I envied him. He was on his way to a difficult audience with the Emperor, while *I* was the real Count Do-nothing – just off on my holidays. There followed all sorts of enjoyable plans for the holidays. At this point a gentleman came on to the platform whom I recognized as a government invigilator at medical examinations, and who by his activities in that capacity had won the flattering nickname of 'government bedfellow'.[3] He asked to be given a first-class half-compartment to himself by virtue of his official position, and I heard one railwayman saying to another: 'Where are we to put the gentleman with the half first-class ticket?'[4] This, I thought to myself, was a fine example of privilege; after all, *I* had paid the full first-class fare. And I did in fact get a compartment to myself, but not in a corridor coach, so that there would be no lavatory available during the night. I complained to an official without any success; but I got my own back on him by suggesting that he should at all events have a hole made in the floor of the compartment to meet the possible needs of passengers. And in fact I did wake up at a quarter to three in the morning with a pressing need to micturate, having had the following dream:

1 ['If my Lord Count is inclined to go dancing,
If My Lord Count is inclined to go dancing,
I'll be quite ready to play him a tune . . .']

2 ['Count Do-nothing.' '*Thun*' is the German word for 'to do'.]

3 ['*Beischläfer*', literally 'one who sleeps with someone' because he used to go to sleep instead of invigilating.]

4 [Being a government official, he had been able to buy his ticket at half rates.]

A crowd of people, a meeting of students. – A count (Thun or Taaffe[1]*) was speaking. He was challenged to say something about the Germans, and declared with a contemptuous gesture that their favourite flower was*
[210] *colt's foot, and put some sort of dilapidated leaf – or rather the crumpled skeleton of a leaf – into his buttonhole. I fired up – so I fired up,*[2] *though I was surprised at my taking such an attitude.*

(Then, less distinctly:) *It was as though I was in the Aula;*[3] *the entrances were cordoned off and we had to escape. I made my way through a series of beautifully furnished rooms, evidently ministerial or public apartments, with furniture upholstered in a colour between brown and violet; at last I came to a corridor, in which a housekeeper was sitting, an elderly stout woman. I avoided speaking to her, but she evidently thought I had a right to pass, for she asked whether she should accompany me with the lamp. I indicated to her, by word or gesture, that she was to stop on the staircase; and I felt I was being very cunning in thus avoiding inspection at the exit. I got downstairs and found a narrow and steep ascending path, along which I went.*

(Becoming indistinct again) . . . *It was as though the second problem was to get out of the town, just as the first one had been to get out of the house. I was driving in a cab and ordered the driver to drive me to a station. 'I can't drive with you along the railway line itself,' I said, after he had raised some objection, as though I had overtired him. It was as if I had already driven with him for some of the distance one normally travels by train. The stations were cordoned off. I wondered whether to go to Krems or Znaim,*[4] *but reflected that the court would be in residence there, so I decided in favour of Graz, or some such place. I was now sitting in the compartment, which was like a carriage on the Stadtbahn* [the suburban railway]*; and in my buttonhole I had a peculiar plaited, long-shaped object, and beside it some violet-brown violets made of a stiff material. This greatly struck people.* (At this point the scene broke off.)

Once more I was in front of the station, but this time in the company of an elderly gentleman. I thought of a plan for remaining unrecognized; and then saw that this plan had already been put into effect. It was as

1 [Austrian politician (1833–95); premier 1870–1 and 1879–93. Like Count Thun, he favoured some degree of independence for the non-German parts of the Empire.]

2 This repetition crept into my record of the dream, apparently through inadvertence. I have let it stand, since the analysis showed that it was significant. [The German is '*ich fahre auf*'; '*fahren*' also means 'to drive' or 'to travel' and is used repeatedly in these senses later in the dream. See on this point p. 386 *n.* 2 below.]

3 [The great ceremonial hall of the university.]

4 [Krems in Lower Austria and Znaim in Moravia were neither of them imperial residences. – Graz is the capital of the province of Styria.]

though thinking and experiencing were one and the same thing. He appeared to be blind, at all events with one eye, and I handed him[t] *a male glass urinal (which we had to buy or had bought in town). So I was a sick-nurse and had to give him the urinal because he was blind. If the* [211]
ticket collector were to see us like that, he would be certain to let us get away without noticing us. Here the man's attitude and his micturating penis appeared in plastic form. (This was the point at which I awoke, feeling a need to micturate.)

The dream as a whole gives one the impression of being in the nature of a phantasy in which the dreamer was carried back to the Revolutionary year 1848. Memories of that year had been recalled to me by the [Emperor Franz Joseph's] jubilee in 1898, as well as by a short trip which I had made to *the Wachau*, in the course of which I had visited Emmersdorf,[1] the place of retirement of the student leader Fischhof, to whom certain elements in the manifest content of the dream may allude. My associations then led me to England and to my brother's house there. He often used to tease his wife with the words 'Fifty Years Ago' (from the title of one of Lord Tennyson's poems),[2] which his children used then to correct to '*fifteen years* ago'. This revolutionary phantasy, however, which was derived from ideas aroused in me by seeing Count Thun, was like the façade of an Italian church in having no organic relation with the structure lying behind it. But it differed from those façades in being disordered and full of gaps, and in the fact that portions of the interior construction had forced their way through into it at many points.

The first situation in the dream was an amalgam of several scenes, which I can separate out. The insolent attitude adopted by the Count in the dream was copied from a scene at my secondary school when I was *fifteen years* old. We had hatched a conspiracy against an unpopular and ignorant master, the moving spirit of which had been one of my school-
fellows who since those days seemed to have taken *Henry VIII of England* [212]
as his model. The leadership in the chief assault was allotted to me, and the signal for open revolt was a discussion on the significance of the

1 [The Wachau is a stretch of the Danube valley some fifty miles above Vienna. – *Footnote added* 1925:] This is a mistake, but not a slip [*Fehlleistung*][T] this time. I only learnt later that the Emmersdorf in the Wachau is not to be identified with the place of the same name which was the refuge of the revolutionary leader Fischhof. [A reference to this mistake can be found in *The Psychopathology of Everyday Life* (Freud, 1901*b*), Chapter X (3); *RSE*, **6**, 190.]

2 [No poem by Tennyson seems to bear this title. The reference is perhaps to his ode 'On the Jubilee of Queen Victoria', in which the words 'fifty years' (though not 'fifty years ago') occur repeatedly. Or, alternatively, the allusion may be to the second 'Locksley Hall': 'Sixty Years After'.]

Danube to Austria (cf. *the Wachau*). One of our fellow conspirators had been the only aristocratic boy in the class, who, on account of his remarkable length of limb, was called 'the Giraffe'. He was standing up, like the Count in my dream, having been taken to task by the school tyrant, the *German language* master. The *favourite flower* and the *putting into his buttonhole* of something in the nature of a flower (which last made me think of some orchids which I had brought the same day for a woman friend and also of a rose of Jericho[1]) were a striking reminder of the scene in one of Shakespeare's historical plays [*Henry VI*, *Part III*, Act I, Scene 1] which represented the beginning of the Wars of the *Red* and *White* Roses. (The mention of *Henry VIII* opened the way to this recollection.) – From there it was only a short step to red and white carnations. (Two little couplets, one in *German* and the other in *Spanish*, slipped into the analysis at this point:

> Rosen, Tulpen, Nelken,
> alle Blumen welken.
>
> *Isabelita*, no llores,
> que se marchitan las flores.[2]

The appearance of a *Spanish* couplet led back to *Figaro*.) Here in Vienna white carnations had become an emblem of anti-Semitism, and red ones of the Social Democrats. Behind this lay a recollection of a piece of anti-Semitic provocation during a railway journey in the lovely Saxon countryside (cf. *Anglo*-Saxon).[3] – The third scene which contributed to the formation of the first situation in the dream dated from my early student days. There was a discussion in a *German* students' club on the relation of philosophy to the natural sciences. I was a green youngster, full of materialistic theories, and thrust myself forward to give expression to an extremely one-sided point of view. Thereupon someone who was my senior and my superior, someone who has since then shown his ability as a leader of men and an organizer of large groups (and who
[213] also, incidentally, bears a name derived from the animal kingdom[4]), stood up and gave us a good talking-to: he too, he told us, had tended

1 [The 'Resurrection plant', whose dried fronds unfold under moisture.]

2 ['Roses, tulips, carnations: every flower fades.' (Lines often found in nineteenth-century 'commonplace books'.) – '*Isabelita*, do not weep because the flowers fade.']

3 [The episode was described by Freud at the time it happened in a letter to his fiancée of December 16, 1883. (Cf. Freud, 1960*a*.)]

4 [Presumably Viktor Adler ('eagle'), the Austrian social democrat leader (1852–1918). Cf. '*Adler*' on p. 190 below.]

swine in his youth and returned repentant to his father's house. *I fired up* (as I did in the dream) and replied boorishly ['*saugrob*', literally 'swinishly gross'] that since I now knew that he had tended *swine* in his youth I was no longer *surprised* at the tone of his speeches. (In the dream I was *surprised* at my German nationalist attitude. [Cf. p. 288 below.]) There was a general uproar and I was called upon from many sides to withdraw my remarks, but I refused to do so. The man I had insulted was too sensible to look upon the incident as a *challenge*, and let the affair drop.

The remaining elements of this first situation in the dream were derived from deeper layers. What was the meaning of the Count's pronouncement about colt's foot? To find the answer, I followed a train of associations: colt's foot ['*Huflattich*', literally 'hoof lettuce'] – lettuce – salad – dog-in-the-manger ['*Salathund*', literally 'salad dog']. Here was a whole collection of terms of abuse: 'Gir-affe' ['*Affe*' is the German for 'ape'], 'swine', 'sow', 'dog' – and I could have arrived at 'donkey' if I had made a detour through another name and insulted yet another academic teacher. Moreover, I translated 'colt's foot' – whether rightly or wrongly I could not tell – by the French '*pisse-en-lit*'.[1] This information was derived from Zola's *Germinal*, in which a child was told to pick some of that plant for salad. The French word for 'dog' – '*chien*' – reminded me of the major function ('*chier*' in French, compared with '*pisser*' for the minor one). Soon, I thought, I should have collected examples of impropriety in all three states of matter – solid, liquid and gaseous – for this same book, *Germinal*, which had plenty to do with the approaching revolution, contained an account of a very peculiar sort of competition – for the production of a gaseous excretion known by the name of '*flatus*'.[2] I now saw that the path leading to *flatus* had been prepared far ahead: from *flowers*, through the *Spanish* couplet, *Isabelita*, *Isabella* and Ferdinand, *Henry VIII*, English history, and the Armada which sailed against *England*, after whose defeat a medal was struck, bearing the [214]
inscription '*Flavit* et dissipati sunt',[3] since the storm blast had scattered

1 ['*Pissenlit*' actually means 'dandelion'.]

2 Not, in fact, in *Germinal* but in *La terre*: a mistake which I only observed after I had completed the analysis. – Notice the occurrence of the same letters in 'H*uflat*tich' ['colt's foot'] and '*flatus*'.

3 ['He blew and they were scattered.' – *Footnote added* 1925:] An unsolicited biographer, Dr Fritz Wittels [1924, 21; Engl. trans. (1924), 28] has charged me with having omitted the name of Jehovah from the above motto. [*Added* 1930:] The English medallion bears the deity's name in Hebrew lettering on a cloud in the background. It is so placed that it can be taken as being part either of the design or of the inscription. – [The idea of using the words as a motto at the head of a chapter on therapy is mentioned in a letter to Fliess of January 3, 1897 (Freud, 1950*a*, Letter 54).]

the Spanish fleet. I had thought, half-seriously, of using those words as the heading to the chapter on 'Therapy', if ever I got so far as producing a detailed account of my theory and treatment of hysteria.

Turning now to the second episode of the dream, I am unable to deal with it in such detail – out of consideration for the censorship. For I was putting myself in the place of an exalted personage of those revolutionary times, who also had an adventure with an eagle [*Adler*] and is said to have suffered from incontinence of the bowels, and so on. I thought to myself that *I should not be justified in passing* the censorship at this point, even though the greater part of the story was told me by a Hofrat (a *consiliarius aulicus* [court councillor] – cf. *Aula*). The series of public rooms in the dream were derived from His Excellency's saloon carriage, of which I had succeeded in getting a glimpse. But the 'rooms' [*Zimmer*] also meant 'women' [*Frauenzimmer*], as is often the case in dreams[1] – in this instance 'public women'. In the figure of the housekeeper I was showing my lack of gratitude towards a witty elderly lady and ill repaying her hospitality and the many good stories that I heard while I was stopping in her house. – The allusion to the lamp went back to Grillparzer,[2] who introduced a charming episode of a similar kind, which he had actually experienced, into his tragedy about Hero and Leander, *Des Meeres und der Liebe Wellen* ['*The Waves of the Sea and of Love*'] – the Armada and the *storm*.[3]

[215] I must also refrain from any detailed analysis of the two remaining episodes of the dream.[4] I will merely pick out the elements leading to the two childhood scenes on whose account alone I embarked upon a discussion of this dream. It will rightly be suspected that what compels me to make this suppression is sexual material; but there is no need to rest content with this explanation. After all, there are many things which one has to keep secret from other people but of which one makes no secret to oneself; and the question here is not as to why I am obliged to conceal the solution but as to the motives for the *internal* censorship

1 ['*Frauenzimmer*', literally 'women's apartment', is commonly used in German as a slightly derogatory word for 'woman'. Cf. p. 316 below.]

2 [The well-known Austrian dramatist (1791–1872).]

3 [*Footnote added* 1911:] In an interesting paper, Silberer (1910) has tried to show from this part of my dream that the dream-work can succeed in reproducing not only the latent dream thoughts but also the psychical processes that take place during the formation of dreams. (This is what he terms 'the functional phenomenon'.) [See below, p. 450 ff. – *Added* 1914:] But he is, I think, overlooking the fact that 'the psychical processes that take place during the formation of dreams' were, like the rest, part of the *material* of my thoughts. In this boastful dream I was evidently proud of having discovered those processes.

4 [The first of these is, in fact, further analysed on p. 385 ff. below.]

which hid the true content of the dream from myself. I must therefore explain that the analysis of these three [last] episodes of the dream showed that they were impertinent boastings, the issue of an absurd megalomania which had long been suppressed in my waking life and a few of whose ramifications had even made their way into the dream's manifest content (e.g. '*I felt I was being very cunning*'), and which incidentally accounted for my exuberant spirits during the evening before I had the dream. The boasting extended to all spheres; for instance, the mention of *Graz* went back to the slang phrase 'What's the price of Graz?', which expresses the self-satisfaction of a person who feels extremely well off. The first episode of the dream may also be included among the boastings by anyone who will bear in mind the great Rabelais' incomparable account of the life and deeds of Gargantua and his son Pantagruel.

Here is the material relating to the two childhood scenes which I have promised my readers. I had bought a *new* trunk for the journey, of a *brownish violet* colour. This colour appears more than once in the dream: the *violet-brown violets made of a stiff material* and beside them a thing known as a '*Mädchenfänger*' ['girl-catcher'][1] – and the furniture in the ministerial apartments. It is commonly believed by children that [216]
people are struck by anything *new*. The following scene from my childhood has been described to me, and my memory of the description has taken the place of my memory of the scene itself. It appears that when I was two years old I still occasionally *wetted the bed*, and when I was reproached for this I *consoled* my father by promising to buy him a nice *new red* bed in N., the nearest town of any size. This was the origin of the parenthetical phrase in the dream to the effect that *we had bought or had to buy* the urinal in town: one must keep one's promises. (Notice, too, the juxtaposition in symbolism of the male urinal and the female trunk or box. [Cf. p. 136 f. above.]) This promise of mine exhibited all the megalomania of childhood. We have already come across the significant part played in dreams by children's difficulties in connection with micturition (cf. the dream reported on p. 177 f.). We have also learnt from the psychoanalysis of neurotic subjects the intimate connection between bedwetting and the character trait of ambition.[2]

1 [This word, ordinarily used in the sense of 'rake' (see footnote 2, p. 192 below), seems here to be the slang name of some sort of buttonhole. Cf. corresponding terms such as 'fascinator' and 'beau-catcher' used in America for women's head-dresses.]

2 [This sentence was added in 1914. The first mention of the connection seems to have been made in the last paragraph of Freud's paper on 'Character and Anal Erotism' (1908*b*), *RSE*, **9**, 153–4.]

When I was seven or eight years old there was another domestic scene, which I can remember very clearly. One evening before going to sleep I disregarded the rules which modesty lays down and obeyed the calls of nature in my parents' bedroom while they were present. In the course of his reprimand, my father let fall the words: 'The boy will come to nothing.' This must have been a frightful blow to my ambition, for references to this scene are still constantly recurring in my dreams and are always linked with an enumeration of my achievements and successes, as though I wanted to say: 'You see, I *have* come to something.' This scene, then, provided the material for the final episode of the dream, in which – in revenge, of course – the roles were interchanged. The older man (clearly my father, since his blindness in one eye referred to his unilateral glaucoma[1]) was now micturating in front of me, just as I had in front of him in my childhood. In the reference
[217] to his glaucoma I was reminding him of the cocaine, which had helped him in the operation [cf. p. 151 above], as though I had in that way kept my promise. Moreover, I was making fun of him; I had to hand him the urinal because he was blind, and I revelled in allusions to my discoveries in connection with the theory of hysteria, of which I felt so proud.[2]

1 There is another interpretation. He was one-eyed like Odin, the father-god. – *Odhins Trost* [*Odin's Consolation*, a mythological novel by Felix Dahn (1880)]. – The *consolation* I offered him in the first childhood scene of buying him a new bed.

2 Here is some further interpretative material. Handing him the glass [urinal] reminded me of the story of the peasant at the optician's, trying glass after glass and still not being able to read. – (Peasant-*catcher* [*Bauernfänger*, 'sharper']: girl-*catcher* [*Mädchenfänger*] in the preceding episode of the dream.) – The way in which the father in Zola's *La terre* was treated among the peasants after he had grown feeble-minded. – The tragic requital that lay in my father's soiling his bed like a child during the last days of his life [cf. p. 382]; hence my appearance in the dream as a *sick-nurse*. – '*Here it was as though thinking and experiencing were one and the same thing*.' This recalled a strongly revolutionary literary play by Oskar Panizza [*Das Liebeskonzil* (1895)], in which God the Father is ignominiously treated as a paralytic old man. In his case will and deed were represented as one and the same thing, and he had to be restrained from cursing and swearing by one of his archangels, a kind of Ganymede, because his imprecations would be promptly fulfilled. – My making *plans* was a reproach against my father dating from a later period. And indeed the whole rebellious content of the dream, with its *lèse-majesté* and its derision of the higher authorities, went back to rebellion against my father. A prince is known as the father of his country; the father is the oldest, first, and for children the only authority, and from his autocratic power the other social authorities have developed in the course of the history of human civilization – except insofar as the 'matriarchy' calls for a qualification of this assertion. – The phrase '*thinking and experiencing were one and the same thing*' had a reference to the explanation of hysterical symptoms, and the '*male urinal*' belonged in the same connection. I need not explain to a Viennese the principle of the '*Gschnas*'. It consists in constructing what appear to be rare and precious objects out of trivial and preferably comic and worthless materials (for instance, in making armour out of saucepans, wisps of straw and dinner rolls) – a favourite pastime at bohemian parties here in Vienna. I had observed that this is precisely what hysterical subjects do: alongside what has really happened to them, they unconsciously build up frightful or perverse imaginary events which they construct out of the most innocent and everyday

The two scenes of micturition from my childhood were in any case closely linked to the topic of megalomania; but their emergence while I was travelling to Aussee was further assisted by the chance circumstance that there was no lavatory attached to my compartment and that I had reason to anticipate the predicament which, in fact, arose in the morning. I awoke with the sensations of a physical need. One might, I think, be inclined to suppose that these sensations were the actual provoking agent of the dream; but I would prefer to take another view, namely that the desire to micturate was only called up by the dream thoughts. It is quite unusual for me to be disturbed in my sleep by physical needs of any kind, especially at the hour at which I awoke on this occasion – a quarter to three in the morning. And I may meet a further objection by remarking that upon other journeys under more comfortable conditions I have scarcely ever felt a need to micturate when I have woken up early. But in any case it will do no harm to leave the point unresolved.[1] [218]

My experiences in analysing dreams have drawn my attention to the fact that trains of thought reaching back to earliest childhood lead off even from dreams which seem at first sight to have been completely interpreted, since their sources and instigating wish have been discovered without difficulty. I have therefore been compelled to ask myself whether this characteristic may not be a further essential precondition for dreaming. Stated in general terms, this would imply that every dream was linked in its manifest content with recent experiences and in its latent content with the most ancient experiences. And I have, in fact, been able to show in my analysis of hysteria that these ancient experiences have remained recent in the proper sense of the word up to the immediate present. It is still extremely hard to demonstrate the truth of this suspicion; and I shall have to return in another connection (Chapter VII, [p. 494 ff.]) to a consideration of the probable part played by the earliest experiences of childhood in the formation of dreams.

Of the three characteristics of memory in dreams enumerated at the beginning of this chapter, one – the preference for non-essential

material of their experience. It is to these phantasies that their symptoms are in the first instance attached and not to their recollections of real events, whether serious or equally innocent. This revelation had helped me over a number of difficulties and had given me particular pleasure. What made it possible for me to refer to this by means of the dream element of the 'male urinal' was as follows. I had been told that at the latest '*Gschnas*' night a poisoned chalice belonging to Lucrezia Borgia had been exhibited; its central and principal constituent had been a *male urinal* of the type used in hospitals.

1 [This dream is further discussed on p. 385 ff. below.]

material in the content of dreams – has been satisfactorily cleared up by being traced back to dream distortion. We have been able to confirm [219] the existence of the other two – the emphasis upon recent and upon infantile material – but we have not been able to account for them on the basis of the motives that lead to dreaming. These two characteristics, whose explanation and appreciation remain to be discovered, must be kept in mind. Their proper place must be looked for elsewhere – either in the psychology of the state of sleep or in the discussion of the structure [*Aufbau*][T] of the mental apparatus upon which we shall later embark, after we have learnt that the interpretation of dreams is like a window through which we can get a glimpse of the interior of that apparatus. [See Chapter VII.]

There is, however, another inference following from these last dream analyses to which I will draw attention at once. Dreams frequently seem to have more than one meaning. Not only, as our examples have shown, may they include several wish fulfilments one alongside the other; but a succession of meanings or wish fulfilments may be superimposed on one another, the bottom one being the fulfilment of a wish dating from earliest childhood. And here again the question arises whether it might not be more correct to assert that this occurs 'invariably' rather than 'frequently'.[1]

1 [*Footnote added* 1914:] The fact that the meanings of dreams are arranged in superimposed layers is one of the most delicate, though also one of the most interesting, problems of dream interpretation. Anyone who forgets this possibility will easily go astray and be led into making untenable assertions upon the nature of dreams. Yet it is still a fact that far too few investigations have been made into this matter. Hitherto the only thorough piece of research has been Otto Rank's [1912*d*] into the fairly regular stratification of symbols in dreams provoked by pressure of the bladder. [See below, p. 360 f.]

(C)
THE SOMATIC SOURCES OF DREAMS

If one tries to interest an educated layman in the problem of dreams and, with that end in view, asks him what in his opinion are the sources from which they arise, one finds as a rule that he feels confident of possessing the answer to this part of the question. He thinks at once of the effects produced on the construction of dreams by digestive disturbances or difficulties – 'dreams come from indigestion' [cf. p. 20 above] – by postures accidentally assumed by the body and by other small incidents during sleep. It never seems to occur to him that when all these factors have been taken into account anything is left over that needs explaining. [220]

I have already discussed at length in the opening chapter (Section C) the part assigned by scientific writers to somatic sources of stimulation in the formation of dreams; so that here I need only recall the results of that enquiry. We found that three different kinds of somatic sources of stimulation were distinguished: objective sensory stimuli arising from external objects, internal states of excitation of the sense organs having only a subjective basis, and somatic stimuli derived from the interior of the body. We noticed, moreover, that the authorities were inclined to push into the background, or to exclude entirely, any possible *psychical* sources of dreams, as compared with these somatic stimuli (cf. p. 37). In our examination of the claims made on behalf of somatic sources of stimulation we arrived at the following conclusions. The significance of *objective* excitations of the sense organs (consisting partly of chance stimuli during sleep and partly of excitations such as cannot fail to impinge even upon a sleeping mind) is established from numerous observations and has been experimentally confirmed (cf. p. 22 f.). The part played by *subjective* sensory excitations seems to be demonstrated by the recurrence in dreams of hypnagogic sensory images (cf. p. 28 f.). And lastly it appears that, though it is impossible to prove that the images and ideas occurring in our dreams can be traced back to *internal* somatic stimuli to the extent to which this has been asserted to be the case, nevertheless this origin finds support in the universally recognized influence exercised upon our dreams by states of excitation in our digestive, urinary and sexual organs [cf. p. 33]. [221]

It would appear, then, that 'nervous stimulation' and 'somatic stimulation' are the somatic sources of dreams – that is to say, according to many writers, their sole source.

On the other hand, we have already found a number of doubts expressed, which seemed to imply a criticism, not indeed of the *correctness*, but of the *adequacy* of the theory of somatic stimulation.

However secure the supporters of this theory might feel in its factual basis – especially as far as accidental and external nervous stimuli are concerned, since these can be traced in the content of dreams without any trouble at all – not one of them could fail to perceive that it is impossible to attribute the wealth of ideational material [*Vorstellungsinhalt*] in dreams to external nervous stimuli alone. Miss Mary Whiton Calkins (1893, [312]) examined her own and another person's dreams for six weeks with this question in mind. She found that in only 13.2 per cent and 6.7 per cent of them respectively was it possible to trace the element of external sense perception; while only two cases in the collection were derivable from organic sensations. Here we have statistical confirmation of what I had been led to suspect from a hasty survey of my own experiences.

It has often been proposed to separate off 'dreams due to nervous stimulation' from other forms of dreams as a subspecies that has been thoroughly investigated. Thus Spitta [1882, 233] divides dreams into 'dreams due to nervous stimulation' and 'dreams due to association'. This solution was, however, bound to remain unsatisfactory so long as it was impossible to demonstrate the link between the somatic sources of a dream and its ideational content. Thus, in addition to the first objection – the insufficient frequency of external sources of stimulation – there was a second one – the insufficient explanation of dreams afforded by such sources. We have a right to expect the supporters of this theory to give us explanations of two points: first, why it is that the external stimulus of a dream is not perceived in its true character but is invariably misunderstood (cf. the alarm-clock dreams on p. 25 f.); and secondly, why it is that the reaction of the perceiving [222] mind to these misunderstood stimuli should lead to results of such unpredictable variety.

By way of answer to these questions, Strümpell (1877, 108 f.) tells us that, because the mind is withdrawn from the external world during sleep, it is unable to give a correct interpretation of objective sensory stimuli and is obliged to construct illusions on the basis of what is in many respects an indeterminate impression. To quote his own

words: 'As soon as a sensation or complex of sensations or a feeling or a psychical process of any kind arises in the mind during sleep as a result of an external or internal nervous stimulus and is perceived by the mind, that process calls up sensory images from the circle of experiences left over in the mind from the waking state – that is to say, earlier perceptions – which are either bare or accompanied by their appropriate psychical values. The process surrounds itself, as it were, with a larger or smaller number of images of this kind and through them the impression derived from the nervous stimulus acquires its psychical value. We speak here (just as we usually do in the case of waking behaviour) of the sleeping mind "interpreting" the impressions made by the nervous stimulus. The outcome of this interpretation is what we describe as a "dream due to nervous stimulation", that is, a dream whose components are determined by a nervous stimulus producing its psychical effects in the mind according to the laws of reproduction.' [Cf. pp. 26 f., 48 and 51 f. above.]

Wundt [1874, 656 f.] is saying something essentially identical to this theory when he asserts that the ideas occurring in dreams are derived, for the most part at least, from sensory stimuli, including especially coenaesthetic sensations, and are for that reason mainly imaginative illusions and probably only to a small extent pure mnemic ideas intensified into hallucinations. [Cf. p. 37.] Strümpell (1877, 84) has hit upon an apt simile for the relation which subsists on this theory between the contents of a dream and its stimuli, when he writes that 'it is as though the ten fingers of a man who knows nothing of music were wandering over the keys of a piano'. [Cf. pp. 69 and 109.] Thus a dream is not, on this view, a mental phenomenon based on psychical motives, but the outcome of a physiological stimulus which is expressed in psychical symptoms because the apparatus upon which the stimulus impinges is capable of no other form of expression. A [223] similar presupposition also underlies, for instance, the famous analogy by means of which Meynert attempted to explain obsessive ideas: the analogy of a clock face on which certain figures stand out by being more prominently embossed than the rest.[1]

However popular the theory of the somatic stimulation of dreams may have become and however attractive it may seem, its weak point is easily displayed. Every somatic dream stimulus which requires the sleeping mental apparatus to interpret it by the construction of an illusion may give rise to an unlimited number of such attempts at

1 [This has not been traced in Meynert's published writings.]

interpretation – that is to say, it may be represented in the content of the dream by an immense variety of ideas.[1] But the theory put forward by Strümpell and Wundt is incapable of producing any motive governing the relation between an external stimulus and the dream idea chosen for its interpretation – is incapable, that is, of explaining what Lipps (1883, 170) describes as the 'remarkable choice often made' by these stimuli 'in the course of their productive activity'. Objections have further been raised against the presupposition upon which the whole theory of illusion is based – the presupposition that the sleeping mind is incapable of recognizing the true nature of objective sensory stimuli. Burdach, the physiologist, showed us long ago that even in sleep the mind is very well able to interpret correctly the sense impressions that reach it and to react in accordance with that correct interpretation; for he recalled the fact that particular sense impressions which seem important to the sleeper can be excepted from the general neglect to which such impressions are subjected during sleep (as in the case of a nursing mother or wet-nurse and her charge), and that a sleeper is much more certain to be woken by the sound of his own name than by any indifferent auditory impression – all of which
[224] implies that the mind distinguishes between sensations during sleep (cf. p. 47). Burdach went on to infer from these observations that what we must presume during the state of sleep is not an *incapacity to interpret* sensory stimuli but a *lack of interest* in them. The same arguments which were used by Burdach in 1830 were brought forward once more without any modifications by Lipps in 1883 in his criticism of the theory of somatic stimulation. Thus the mind seems to behave like the sleeper in the anecdote. When someone asked him if he was asleep, he replied 'No'. But when his questioner went on to say: 'Then lend me ten florins', he took refuge in a subterfuge and replied: 'I'm asleep.'

The inadequacy of the theory of the somatic stimulation of dreams can be demonstrated in other ways. Observation shows that external stimuli do not necessarily compel me to dream, even though such stimuli appear in the content of my dream when and if I do dream. Supposing, let us say, that I am subjected to a tactile stimulus while I am asleep. A variety of different reactions are then open to me. I may

1 [*Footnote added* 1914:] Mourly Vold [1910–12] has produced a two-volume work containing detailed and precise reports of a series of experimentally produced dreams. [Cf. p. 35 above.] I should recommend a study of this work to anyone who wishes to convince himself of how little light is thrown on the content of individual dreams by the conditions of the experiments described in it and of how little help in general is afforded by such experiments towards an understanding of the problems of dreams. [See, however, p. 160 f. *n.* 2.]

disregard it, and when I wake up I may find, for instance, that my leg is uncovered or that there is some pressure on my arm; pathology provides very numerous instances in which various powerfully exciting sensory and motor stimuli can remain without effect during sleep. Or again, I may be aware of the sensation in my sleep – I may be aware of it, as one might say, 'through' my sleep – (which is what happens as a rule in the case of painful stimuli) but without my weaving the pain into a dream. And thirdly, I may react to the stimulus by waking up so as to get rid of it.[1] It is only as a fourth possibility that the nervous stimulus may cause me to dream. Yet the other possibilities are realized at least as frequently as this last one of constructing a dream. And this could not happen unless the motive for dreaming lay *elsewhere than in somatic sources of stimulation*.

Certain other writers – Scherner [1861] and Volkelt [1875], the philosopher, who adopted Scherner's views – formed a just estimate of the gaps which I have here indicated in the explanation of dreams as being due to somatic stimulation. These writers attempted to define more precisely the mental activities which lead to the production of such [225] variegated dream images from the somatic stimuli; in other words, they sought to regard dreaming once again as something essentially *mental* – as a psychical activity. [Cf. p. 73 ff. above.] Scherner did not merely depict the psychical characteristics unfolded in the production of dreams in terms charged with poetic feeling and glowing with life; he believed, too, that he had discovered the principle according to which the mind deals with the stimuli presented to it. On his view, the dream-work, when the imagination is set free from the shackles of daytime, seeks to give a *symbolic* representation of the nature of the organ from which the stimulus arises and of the nature of the stimulus itself. Thus he provides a kind of 'dream book' to serve as a guide to the interpretation of dreams, which makes it possible to deduce from the dream images inferences as to the somatic feelings, the state of the organs and the character of the stimuli concerned. 'Thus the image of a cat expresses a state of angry ill-temper, and the image of a smooth and lightly coloured loaf of bread stands for physical nudity.' [Volkelt, 1875, 32.] The human body as a whole is pictured by the dream imagination as a house and the separate organs of the body as portions of a house. In 'dreams with a dental stimulus', an entrance hall with a high, vaulted roof

1 [*Footnote added* 1919:] Cf. Landauer (1918) on behaviour during sleep. Anyone can observe persons asleep carrying out actions which obviously have a meaning. A man asleep is not reduced to complete idiocy; on the contrary, he is capable of logical and deliberate acts.

corresponds to the oral cavity and a staircase to the descent from the throat to the oesophagus. 'In dreams due to headaches, the top of the head is represented by the ceiling of a room covered with disgusting, toadlike spiders.' [Ibid., 33 f.] A variety of such symbols are employed by dreams to represent the same organ. 'Thus the breathing lung will be symbolically represented by a blazing furnace, with flames roaring with a sound like the passage of air; the heart will be represented by hollow boxes or baskets, the bladder by round, bag-shaped objects or, more generally, by hollow ones.' [Ibid., 34.] 'It is of special importance that at the end of a dream the organ concerned or its function is often openly revealed, and as a rule in relation to the dreamer's own body. Thus a dream with a dental stimulus usually ends by the dreamer picturing himself pulling a tooth out of his mouth.' [Ibid., 35.]

This theory of dream interpretation cannot be said to have been very favourably received by other writers on the subject. Its main feature seems to be its extravagance; and there has even been hesitation in
[226] recognizing such justification as, in my opinion, it can lay claim to. As will have been seen, it involves a revival of dream interpretation by means of *symbolism* – the same method that was employed in antiquity, except that the field from which interpretations are collected is restricted within the limits of the human body. Its lack of any technique of interpreting that can be grasped scientifically must greatly narrow the application of Scherner's theory. It seems to leave the door open to arbitrary interpretations, especially as in its case, too, the same stimulus can be represented in the dream content in a variety of different ways. Thus even Scherner's disciple, Volkelt, found himself unable to confirm the view that the body was represented by a house. Objections are also bound to arise from the fact that once again the mind is saddled with the dream-work as a useless and aimless function; for, according to the theory we are discussing, the mind is content with making phantasies about the stimulus with which it is occupied, without the remotest hint at anything in the nature of *disposing* of the stimulus.

There is one particular criticism, however, which is gravely damaging to Scherner's theory of the symbolization of somatic stimuli. These stimuli are present at all times and it is generally held that the mind is more accessible to them during sleep than when it is awake. It is difficult to understand, then, why the mind does not dream continuously all through the night, and, indeed, dream every night of all the organs. An attempt may be made to avoid this criticism by adding the further condition that in order to arouse dream activity it is necessary for *special*

excitations to proceed from the eyes, ears, teeth, intestines, etc. But the difficulty then arises of proving the objective nature of such increases of stimulus – which is only possible in a small number of cases. If dreams of flying are a symbolization of the rising and sinking of the lobes of the lungs [cf. p. 34 above], then, as Strümpell [1877, 119] has already pointed out, either such dreams would have to be much more frequent than they are or it would be necessary to prove an increase in the activity of breathing in the course of them. There is a third possibility, which is the most probable of all, namely that special motives may be temporarily operative which direct the attention to visceral sensations that are uniformly present at all times. This possibility, however, carries us beyond the scope of Scherner's theory.

The value of the views put forward by Scherner and Volkelt lies in the [227]
fact that they draw attention to a number of characteristics of the content of dreams which call for explanation and seem to promise fresh discoveries. It is perfectly true that dreams contain symbolizations of bodily organs and functions, that water in a dream often points to a urinary stimulus, and that the male genitals can be represented by an upright stick or a pillar, and so on. In the case of dreams in which the field of vision is full of movement and bright colours, in contrast to the drabness of other dreams, it is scarcely possible not to interpret them as 'dreams with a visual stimulus'; nor can one dispute the part played by illusions in the case of dreams characterized by noise and a confusion of voices. Scherner [1861, 167] reports a dream of two rows of pretty, fair-haired boys standing opposite each other on a bridge, and of their attacking each other and then going back to their original position, till at last the dreamer saw himself sitting down on a bridge and pulling a long tooth out of his jaw. Similarly Volkelt [1875, 52] reports a dream in which two rows of drawers in a cupboard played a part and which once more ended with the dreamer pulling out a tooth. Dream formations such as these, which are recorded in great numbers by the two authors, forbid our dismissing Scherner's theory as an idle invention without looking for its kernel of truth. [See p. 309 f. below.] The task, then, that faces us is to find an explanation of another kind for the supposed symbolization of what is alleged to be a dental stimulus.[1]

Throughout the whole of this discussion of the theory of the somatic sources of dreams I have refrained from making use of the argument based upon my dream analyses. If it can be proved, by a procedure

1 [These dreams are further considered on p. 345 ff. below.]

which other writers have not employed upon their dream material, that dreams possess a value of their own as psychical acts, that wishes are the motive for their construction and that experiences of the preceding day provide the immediate material for their content, then any other theory of dreams, which neglects so important a procedure of research and accordingly represents dreams as a useless and puzzling psychical reaction to somatic stimuli, stands condemned without there being any necessity for specific criticisms. Otherwise – and this seems highly
[228] improbable – there would have to be two quite different kinds of dreaming, one of which has come under only *my* observation and the other under only that of the earlier authorities. All that remains, therefore, is to find a place in my theory of dreams for the facts upon which the current theory of the somatic stimulation of dreams is based.

We have already taken the first step in this direction by advancing the thesis (see p. 158 f.) that the dream-work is under the necessity of combining into a unity all instigations to dreaming which are active simultaneously. We found that, when two or more experiences capable of creating an impression are left over from the previous day, the wishes derived from them are combined in a single dream, and similarly that the psychically significant impression and the indifferent experiences from the previous day are brought together in the dream material, provided always that it is possible to set up communicating ideas between them. Thus a dream appears to be a reaction to everything that is simultaneously present in the sleeping mind as currently active material. So far as we have hitherto analysed the material of dreams, we have seen it as a collection of psychical residues and memory traces, to which (on account of the preference shown for recent and infantile material) we have been led to attribute a hitherto indefinable quality of being 'currently active'. We can foresee, then, without any great difficulty, what will happen if fresh material in the form of sensations is added during sleep to these currently active memories. It is once again owing to the fact of their being currently active that these sensory excitations are of importance for the dream; they are united with the other currently active psychical material to furnish what is used for the construction of the dream. To put it another way, stimuli arising during sleep are worked up into a wish fulfilment the other constituents of which are the familiar psychical 'day's residues' [*Tagesreste*]. This combination *need* not occur; as I have already pointed out, there is more than one way of reacting to a somatic stimulus during sleep. When it *does* occur, it means that it has been possible to find ideational material

to serve as the content of the dream of such a sort as to be able to represent both kinds of source of the dream – the somatic and the psychical.

The essential nature of the dream is not altered by the fact of somatic material being added to its psychical sources: a dream remains the fulfilment of a wish, no matter in what way the expression of that wish [229] fulfilment is determined by the currently active material.

I am prepared to leave room at this point for the operation of a number of special factors which can lend a varying importance to external stimuli in relation to dreams. As I picture it, a combination of individual factors, physiological and accidental, produced by the circumstances of the moment, is what determines how a person shall behave in particular cases of comparatively intense objective stimulation during sleep. The habitual or accidental depth of his sleep, taken in conjunction with the intensity of the stimulus, will make it possible in one case for him to suppress the stimulus so that his sleep is not interrupted and in another case will compel him to wake up or will encourage an attempt to overcome the stimulus by weaving it into a dream. In accordance with these various possible combinations, external objective stimuli will find expression in dreams with greater or lesser frequency in one person than in another. In my own case, since I am an excellent sleeper and obstinately refuse to allow anything to disturb my sleep, it very rarely happens that external causes of excitation find their way into my dreams; whereas psychical motives obviously cause me to dream very easily. In fact, I have only noted a single dream in which an objective and painful source of stimulus is recognizable; and it will be most instructive to examine the effect which the external stimulus produced in this particular dream.

I was riding on a grey horse, timidly and awkwardly to begin with, as though I were only reclining upon it. I met one of my colleagues, P., who was sitting high on a horse, dressed in a tweed suit, and who drew my attention to something (probably to my bad seat). I now began to find myself sitting more and more firmly and comfortably on my highly intelligent horse, and noticed that I was feeling quite at home up there. My saddle was a kind of bolster, which completely filled the space between its neck and crupper. In this way I rode straight in between two vans. After riding some distance up the street, I turned round and tried to dismount, first in front of a small open chapel that stood in the street frontage. Then I actually did dismount in front of another chapel that

stood near it. My hotel was in the same street; I might have let the horse go to it on its own, but I preferred to lead it there. It was as though I should have felt ashamed to arrive at it on horseback. A hotel 'boots' was standing in front of the hotel; he showed me a note of mine that had been [230] *found, and laughed at me over it. In the note was written, doubly underlined: 'No food', and then another remark* (indistinct) *such as 'No work', together with a vague idea that I was in a strange town in which I was doing no work.*

It would not be supposed at first sight that this dream originated under the influence, or rather under the compulsion, of a painful stimulus. But for some days before I had been suffering from boils which made every movement a torture; and finally a boil the size of an apple had risen at the base of my scrotum, which caused me the most unbearable pain with every step I took. Feverish lassitude, loss of appetite and the hard work with which I nevertheless carried on – all these had combined with the pain to depress me. I was not properly capable of discharging my medical duties. There was, however, one activity for which, in view of the nature and situation of my complaint, I should certainly have been less fitted than for any other, and that was – riding. And this was precisely the activity in which the dream landed me: it was the most energetic denial of my illness that could possibly be imagined. I cannot in fact ride, nor have I, apart from this, had dreams of riding. I have only sat on a horse once in my life and that was without a saddle, and I did not enjoy it. But in this dream I was riding as though I had no boil on my perineum – or rather *because I wanted not to have one*. My saddle, to judge from its description, was the poultice which had made it possible for me to fall asleep. Under its assuaging influence I had probably been unaware of my pain during the first hours of sleep. The painful feelings had then announced themselves and sought to wake me; whereupon the dream came and said soothingly: 'No! Go on sleeping! There's no need to wake up. You haven't got a boil; for you're riding on a horse, and it's quite certain that you couldn't ride if you had a boil in that particular place.' And the dream was successful. The pain was silenced, and I went on sleeping.

But the dream was not content with 'suggesting away' my boil by obstinately insisting upon an idea that was inconsistent with it and so behaving like the hallucinatory delusion of the mother who had lost her child or the merchant whose losses had robbed him of his fortune.[1] The

1 Cf. the passage in Griesinger [1862, 106, referred to on p. 80 f. above] and my remarks in my second paper on the neuropsychoses of defence (Freud, 1896*b*). [Actually the reference seems to be to a paragraph near the end of Freud's *first* paper on that subject (Freud, 1894*a*), *RSE*, **3**, 55.]

details of the sensation which was being repudiated and of the picture [231]
which was employed in order to repress that sensation also served the dream as a means of connecting *other* material that was currently active in my mind with the situation in the dream and of giving that material representation. I was riding on a *grey* horse, whose colour corresponded precisely to the *pepper and salt* colour of the suit my colleague P. was wearing when I had last met him in the country. The cause of my boils had been ascribed to my eating *highly spiced* food – an aetiology that was at least preferable to the *sugar* [diabetes] which might also occur to one in connection with boils. My friend P. liked to ride *the high horse* over me ever since he had taken over one of my women patients on whom I had pulled off some remarkable *feats*. (In the dream I began by riding tangentially – like the *feat* of a trick rider.) But in fact, like the horse in the anecdote of the Sunday horseman,[1] this patient had taken me wherever she felt inclined. Thus the horse acquired the symbolic meaning of a woman patient. (It was *highly intelligent* in the dream.) '*I felt quite at home up there*' referred to the position I had occupied in this patient's house before I was replaced by P. Not long before, one of my few patrons among the leading physicians in this city had remarked to me in connection with this same house: 'You struck me as being firmly in the saddle there.' It was a remarkable *feat*, too, to be able to carry on my psychotherapeutic work for eight or ten hours a day while I was having so much pain. But I knew that I could not go on long with my peculiarly difficult work unless I was in completely sound physical health; and my dream was full of gloomy allusions to the situation in which I should then find myself. (The *note* which neurasthenics bring with them to show the doctor; *no work, no food*.) In the course of further interpretation I saw that the dream-work had succeeded in finding a path from the wishful situation of riding to some scenes of quarrelling from my very early childhood which must have occurred between me and a nephew of mine, a year my senior, who was at present living in England. [Cf. p. 379 below.] Furthermore, the dream had derived some of its elements from my travels in Italy: the street in the dream was composed of impressions of Verona and Siena. A still deeper interpretation led to sexual dream [232]
thoughts, and I recalled the meaning which references to Italy seem to have had in the dreams of a woman patient who had never visited that lovely country: '*gen Italien* [to Italy]' – '*Genitalien* [genitals]'; and this

1 [In a letter to Fliess of July 7, 1898 (Freud, 1950*a*, Letter 92), Freud describes 'the famous principle of Itzig, the Sunday horseman: "Itzig, where are you riding to?" – "Don't ask *me*! Ask the horse!"']

was connected, too, with the house in which I had preceded my friend P. as physician, as well as with the situation of my boil.

In another dream[1] I similarly succeeded in warding off a threatened interruption of my sleep which came this time from a sensory stimulus. In this case it was only by chance, however, that I was able to discover the link between the dream and its accidental stimulus and thus to understand the dream. One morning at the height of summer, while I was staying at a mountain resort in the Tyrol, I woke up knowing I had had a dream that *the Pope was dead*. I failed to interpret this dream – a non-visual one – and only remembered as part of its basis that I had read in a newspaper a short time before that his Holiness was suffering from a slight indisposition. In the course of the morning, however, my wife asked me if I had heard the frightful noise made by the pealing of bells that morning. I had been quite unaware of them, but I now understood my dream. It had been a reaction on the part of my need for sleep to the noise with which the pious Tyrolese had been trying to wake me. I had taken my revenge on them by drawing the inference which formed the content of the dream, and I had then continued my sleep without paying any more attention to the noise.

The dreams quoted in earlier chapters included several which might serve as instances of the working over of such so-called nervous stimuli. My dream of drinking water in great gulps [p. 110 above] is an example. The somatic stimulus was apparently its only source, and the wish derived from the sensation (the thirst, that is) was apparently its only motive. The case is similar to other simple dreams in which a somatic stimulus seems able by itself to construct a wish. The dream of the woman patient who threw off the cooling apparatus from her cheek
[233] during the night [p. 112] presents an unusual method of reacting to a painful stimulus with a wish fulfilment: it appears as though the patient succeeded temporarily in making herself analgesic, while ascribing her pains to someone else.

My dream of the three Fates [p. 180 ff.] was clearly a hunger dream. But it succeeded in shifting the craving for nourishment back to a child's longing for his mother's breast, and it made use of an innocent desire as a screen for a more serious one which could not be so openly

1 [This paragraph was added in 1914. The dream had already been very briefly recorded in Freud, 1913*b* (No. 1); *RSE*, **13**, 186; it can also be found in Lecture V of Freud (1916–17*a*). Cf. ibid., **15**, 83. The original manuscript note of this dream, dated December 12, 1911, appears in Grubrich-Simitis (1993, 148; trans., 110).]

displayed. My dream about Count Thun [p. 184 ff. above] showed how an accidental physical need can be linked up with the most intense (but at the same time the most intensely suppressed) mental impulses [*Regungen des Seelenlebens*][T]. And a case such as that related by Garnier (1872, **1**, 476) of how the First Consul wove the noise of an exploding bomb into a battle dream before he woke up from it [p. 24] reveals with quite special clarity the nature of the sole motive that leads mental activity to concern itself with sensations during sleep. A young barrister,[1] fresh from his first important bankruptcy proceedings, who dropped asleep one afternoon, behaved in just the same way as the great Napoleon. He had a dream of a certain G. Reich of *Husyatin* [a town in Galicia] whom he had come across during a bankruptcy case; the name 'Husyatin' kept on forcing itself on his notice, till he woke up and found that his wife (who was suffering from a bronchial catarrh) was having a violent fit of coughing [in German '*husten*'].

Let us compare this dream of the first Napoleon (who, incidentally, was an extremely sound sleeper) with that of the sleepy student who was roused by his landlady and told that it was time to go to the hospital, and who proceeded to dream that he was in bed at the hospital and then slept on, under the pretext that as he was already in the hospital there was no need for him to get up and go there [p. 111 f. above]. This latter dream was clearly a dream of convenience. The dreamer admitted his motive for dreaming without any disguise; but at the same time he gave away one of the secrets of dreaming in general. All dreams are in a sense dreams of convenience: they serve the purpose of prolonging sleep instead of waking up. *Dreams are the* GUARDIANS *of sleep and not its disturbers*. We shall have occasion elsewhere to justify this view of them in relation to awakening factors of a *psychical* kind [see below, p. 518]; but we are already in a position to show that it is applicable to the part played by objective external [234]
stimuli. Either the mind pays no attention at all to occasions for sensation during sleep – if it is able to do this despite the intensity of the stimuli and the significance which it knows attaches to them; or it makes use of a dream in order to deny the stimuli; or, thirdly, if it is obliged to recognize them, it seeks an interpretation of them which will make the currently active sensation into a component part of a situation which is wished for and which is consistent with sleeping. The currently active sensation is woven into a dream *in order to rob it of reality*. Napoleon could sleep on – with a conviction that what was

1 [This sentence and the next were added in 1909.]

trying to disturb him was only a dream memory of the thunder of the guns at Arcole.[1]

Thus the wish to sleep (which the conscious ego [*Ich*]^{T} *is concentrated upon, and which, together with the dream censorship and the 'secondary revision'* [*sekundären Bearbeitung*] *which I shall mention later* [p. 437 ff. below], *represents the conscious ego's contribution to dreaming) must in every case be reckoned as one of the motives for the formation of dreams, and every successful dream is a fulfilment of that wish.*[2] We shall discuss elsewhere [p. 510 ff.] the relations subsisting between this universal, invariably present and unchanging wish to sleep and the other wishes, of which now one and now another is fulfilled by the content of the dream. But we have found in the wish to sleep the factor that is able to fill the gap in the theory of Strümpell and Wundt [p. 198] and to explain the perverse and capricious manner in which external stimuli are interpreted. The correct interpretation, which the sleeping mind is perfectly capable of making, would involve an active interest and would require that sleep should be brought to an end; for that reason, of all the possible interpretations, only those are admitted which are consistent with the absolute censorship exercised by the wish to sleep. 'It is the nightingale and not the lark.'[3] For if it were the lark it would mean the end of the lovers' night. Among the interpretations of the stimulus
[235] which are accordingly admissible, that one is then selected which can provide the best link with the wishful impulses lurking in the mind. Thus everything is unambiguously determined and nothing is left to arbitrary decision. The misinterpretation is not an illusion but, as one might say, an evasion. Here once again, however, just as when, in obedience to the dream censorship, a substitution is effected by displacement, we have to admit that we are faced with an act which deviates from normal psychical processes.

When external nervous stimuli and internal somatic stimuli are intense enough to force psychical attention to themselves, then – provided that their outcome *is* dreaming and not waking up – they serve as a fixed point for the formation of a dream, a nucleus in its material; a wish

1 The two sources from which I know this dream do not agree in their account of it.

2 [The portion of this sentence in brackets was not included in the first or second edition (1900 and 1909). The phrase 'which the conscious ego is concentrated upon, and which, together with the dream censorship, represents the conscious ego's contribution to dreaming' was added in 1911. The phrase 'and the "secondary revision" which I shall mention later' was added as a footnote in 1914 and incorporated in the text in 1930.]

3 [A slightly free quotation from *Romeo and Juliet*, Act III, Scene 5.]

fulfilment is then looked for that shall correspond to this nucleus, just as (see above [p. 202 f.]) intermediate ideas are looked for between two psychical dream stimuli. To that extent it is true that in a number of dreams the content of the dream is dictated by the somatic element. In this extreme instance it may even happen that a wish which is not actually a currently active one is called up for the sake of constructing a dream. A dream, however, has no alternative but to represent a wish in the situation of having been fulfilled; it is, as it were, faced with the problem of looking for a wish which can be represented as fulfilled by the currently active sensation. If this immediate material is of a painful or distressing kind, that does not necessarily mean that it cannot be used for the construction of a dream. The mind has wishes at its disposal whose fulfilment produces unpleasure. This seems self-contradictory; but it becomes intelligible when we take into account the presence of two psychical agencies and a censorship between them.

As we have seen, there are 'repressed' [*verdrängte*][T] wishes in the mind, which belong to the first system and whose fulfilment is opposed by the second system. In saying that there are such wishes I am not making a historical statement to the effect that they once existed and were later abolished. The theory of repression, which is essential to the study of the psychoneuroses, asserts that these repressed wishes *still* exist – though there is a simultaneous inhibition which holds them down. Linguistic usage hits the mark in speaking of the 'suppression' [*Unterdrücken*, i.e. the 'pressing down'] of these impulses. The psychical arrangements that make it possible for such impulses to force their way to realization remain in being and in working order. Should it happen, however, that a suppressed wish of this kind is carried into effect, and that its inhibition by the second system (the system that is admissible to consciousness) is defeated, this defeat finds expression as unpleasure. In conclusion: if sensations of an unpleasurable nature arising from somatic sources occur during sleep, the dream-work makes use of that event in order to represent – subject to the continuance of the censorship to a greater or lesser degree – the fulfilment of some wish which is normally suppressed.[1]

Verdrängung

[236]

This state of affairs is what makes possible one group of anxiety dreams – dream structures unpropitious from the point of view of the wish theory. A second group of them reveal a different mechanism; for anxiety in dreams may be psychoneurotic anxiety: it may originate from

1 [This whole subject is further discussed in Section C of Chapter VII; see especially p. 498 ff. below. Cf. also pp. 237 and 435 f.]

psychosexual excitations [*Erregungen*][T] – in which case the anxiety corresponds to repressed libido. Where this is so, the anxiety, like the whole anxiety dream, has the significance of a neurotic symptom, and we come near the limit at which the wish-fulfilling purpose of dreams breaks down. [See pp. 142 f. above and 519 f. below.] But there are some anxiety dreams [those of the first group] in which the feeling of anxiety is determined somatically – where, for instance, there happens to be difficulty in breathing owing to disease of the lungs or heart – and in such cases the anxiety is exploited in order to assist the fulfilment in the form of dreams of energetically suppressed wishes which, if they had been dreamt about for *psychical* reasons, would have led to a similar release of anxiety. But there is no difficulty in reconciling these two apparently different groups. In both groups of dreams two psychical factors are involved: an inclination towards an affect and an ideational content; and these are intimately related to each other. If one of them is currently active, it calls up the other even in a dream; in the one case the somatically determined anxiety calls up the suppressed ideational content, and in the other the ideational content with its accompanying sexual excitation, having been set free from repression, calls up a release of anxiety. We can put it that in the first case a somatically determined affect is
[237] given a psychical interpretation; while in the other case, though the whole is psychically determined, the content which had been suppressed is easily replaced with a somatic interpretation appropriate to anxiety. The difficulties which all this offers to our understanding have little to do with dreams: they arise from the fact that we are here touching on the problem of the generation of anxiety and on the problem of repression.

There can be no doubt that physical coenaesthesia [or diffuse general sensibility, see p. 32] is among the internal somatic stimuli which can dictate the content of dreams. It can do so, not in the sense that it can provide the dream's content, but in the sense that it can force upon the dream thoughts a choice of the material to be represented in the content by putting forward one part of the material as being appropriate to its own character and by holding back another part. Apart from this, the coenaesthetic feelings left over from the preceding day link themselves up, no doubt, with the psychical residues which have such an important influence on dreams. This general mood may persist unchanged in the dream or it may be mastered, and thus, if it is unpleasurable, may be changed into its opposite.[1]

1 [Cf. p. 435 f. below. – This last sentence was added in 1914.]

Thus, in my opinion, somatic sources of stimulation during sleep (that is to say, sensations during sleep), unless they are of unusual intensity, play a similar part in the formation of dreams to that played by recent but indifferent impressions left over from the previous day. I believe, that is, that they are brought in to help in the formation of a dream if they fit in appropriately with the ideational content derived from the dream's psychical sources, but otherwise not. They are treated like some cheap material always ready to hand, which is employed whenever it is needed, in contrast to a precious material which itself prescribes the way in which it shall be employed. If, to take a simile, a patron of the arts brings an artist some rare stone, such as a piece of onyx, and asks him to create a work of art from it, then the size of the stone, its colour and markings, help to decide what head or what scene shall be represented in it. Whereas in the case of a uniform and plentiful material such as marble or sandstone, the artist merely follows some idea that is present in his own mind. It is only in this way, so it seems to me, that we can explain the fact that dream content [238] provided by somatic stimuli of no unusual intensity fails to appear in every dream or every night. [Cf. p. 200 f. above.][1]

I can perhaps best illustrate my meaning by an example, which, moreover, will bring us back to dream interpretation.

One day I had been trying to discover what might be the meaning of the feelings of being inhibited, of being glued to the spot, of not being able to get something done, and so on, which occur so often in dreams and are so closely akin to feelings of anxiety. That night I had the following dream:

I was very incompletely dressed and was going upstairs from a flat on the ground floor to a higher storey. I was going up three steps at a time and was delighted at my agility. Suddenly I saw a maidservant coming down the stairs – coming towards me, that is. I felt ashamed and tried to hurry, and at this point the feeling of being inhibited set in: I was glued to the steps and unable to budge from the spot.

ANALYSIS. – The situation in the dream is taken from everyday reality. I occupy two flats in a house in Vienna, which are connected only by the public staircase. My consulting room and study are on the upper ground floor and my living rooms are one storey higher. When, late in

1 [*Footnote added* 1914:] Rank has shown in a number of papers [1910*a*, 1912*b* and 1912*d*] that certain arousal dreams produced by organic stimuli (dreams with a urinary stimulus and dreams of emission or orgasm) are especially suited to demonstrate the struggle between the need to sleep and the claims of organic needs, as well as the influence of the latter upon the content of dreams. [See p. 359 ff. below.]

the evening, I have finished my work down below, I go up the stairs to my bedroom. On the evening before I had the dream, I had, in fact, made this short journey in rather disordered dress – that is to say, I had taken off my collar and tie and cuffs. In the dream this had been turned into a higher degree of undress, but, as usual, an indeterminate one. [Cf. p. 217 f. below.] I usually go upstairs two or three steps at a time; and this was recognized in the dream itself as a wish fulfilment: the ease with which I achieved it reassured me as to the functioning of my heart. Further, this method of going upstairs was an effective contrast to the inhibition [*Hemmung*] in the second half of the dream. It showed me – what needed no proving – that dreams find no difficulty in representing motor acts carried out to perfection. (One need only recall dreams of flying.)

[239] The staircase up which I was going, however, was not the one in my house. At first I failed to recognize it and it was only the identity of the person who met me that made it clear to me what locality was intended. This person was the maidservant of the old lady whom I was visiting twice a day in order to give her injections [cf. p. 105]; and the staircase, too, was just like the one in her house which I had to go up twice a day.

Now how did this staircase and this female figure come to be in my dream? The feeling of shame at not being completely dressed is no doubt of a sexual nature; but the maidservant whom I dreamt about was older than I am, surly and far from attractive. The only answer to the problem that occurred to me was this. When I paid my morning visits to this house I used as a rule to be seized with a desire to clear my throat as I went up the stairs and the product of my expectoration would fall on the staircase. For on neither of these floors was there a spittoon; and the view I took was that the cleanliness of the stairs should not be maintained at my expense but should be made possible by the provision of a spittoon. The concierge, an equally elderly and surly woman (but of cleanly instincts [*Instinkten*], as I was prepared to admit), looked at the matter in a different light. She would lie in wait for me to see whether I should again make free of the stairs, and, if she found that I did, I used to hear her grumbling audibly; and for several days afterwards she would omit the usual greeting when we met. The day before I had the dream the concierge's party had received a reinforcement in the shape of the maidservant. I had, as usual, concluded my hurried visit to the patient, when the servant stopped me in the hall and remarked: 'You might have wiped your boots, doctor, before you came into the room today. You've made the

red carpet all dirty again with your feet.' This was the only claim the staircase and the maidservant had to appearing in my dream.

There was an internal connection between my running up the stairs and my spitting on the stairs. Pharyngitis as well as heart trouble are both regarded as punishments for the vice of smoking. And on account of that habit my reputation for tidiness was not of the highest with the authorities in my own house any more than in the other; so that the two were fused into one in the dream.

I must postpone my further interpretation of this dream till I can [240] explain the origin of the typical dream of being incompletely dressed. I will only point out as a provisional conclusion to be drawn from the present dream that a sensation of inhibited movement in dreams is produced whenever the particular context requires it. The cause of this part of the dream's content cannot have been that some special modification in my powers of movement had occurred during my sleep, since only a moment earlier I had seen myself (almost as though to confirm this fact) running nimbly up the stairs.[1]

1 [The feeling of inhibition in dreams is discussed at length on p. 299 ff. below. The present dream is further analysed on p. 219 f. It was reported in a letter to Fliess of May 31, 1897. (Freud, 1950*a*, Letter 64.)]

(D)
TYPICAL DREAMS

[241] We are not in general in a position to interpret another person's dream unless he is prepared to communicate to us the unconscious thoughts that lie behind its content. The practical applicability of our method of interpreting dreams is in consequence severely restricted.[1] We have seen that, as a general rule, each person is at liberty to construct his dream world according to his individual peculiarities and so to make it unintelligible to other people. It now appears, however, that, in complete contrast to this, there are a certain number of dreams which almost everyone has dreamt alike and which we are accustomed to assume must have the same meaning for everyone.[2] A special interest attaches, moreover, to these typical dreams because they presumably arise from the same sources in every case and thus seem particularly well qualified to throw light on the sources of dreams.

It is therefore with quite particular anticipations that we shall attempt to apply our technique of dream interpretation to these typical dreams; and it is with great reluctance that we shall have to confess that our art disappoints our expectations precisely in relation to this material. If we attempt to interpret a typical dream, the dreamer fails as a rule to produce the associations which would in other cases have led us to understand it, or else his associations become obscure and insufficient so that we cannot solve our problem with their help. We shall learn in
[242] a later portion of this work [Section E of Chapter VI; p. 313 ff.] why this is so and how we can make up for this defect in our technique. My readers will also discover why it is that at the present point I am able to deal with only a few members of the group of typical dreams and must

1 [*Footnote added* 1925:] This assertion that our method of interpreting dreams cannot be applied unless we have access to the dreamer's associative material requires supplementing: our interpretative activity is in one instance independent of these associations – if, namely, the dreamer has employed *symbolic* elements in the content of the dream. In such cases we make use of what is, strictly speaking, a second and auxiliary method of dream interpretation. (See below [p. 321 f.].) [In the edition of 1911 only, the following footnote appeared at this point: 'Apart from cases in which the dreamer makes use of symbols which are familiar to us for the purpose of representing his latent dream thoughts (see below).']

2 [Freud's characterization of his own 'typical dreams' is appended to the present work; *RSE*, **5**, 565 ff.]

postpone my consideration of the rest until this later point in my discussion. [See p. 344 ff. below.][1]

(α) *Embarrassing Dreams of Being Naked*

Dreams of being naked or insufficiently dressed in the presence of strangers sometimes occur with the additional feature of there being a complete absence of any such feeling as shame on the dreamer's part. We are only concerned here, however, with those dreams of being naked in which one *does* feel shame and embarrassment and tries to escape or hide, and is then overcome by a strange inhibition which prevents one from moving and makes one feel incapable of altering one's distressing situation. It is only with this accompaniment that the dream is typical; without it, the gist of its subject matter may be included in every variety of context or may be ornamented with individual trimmings. Its essence [in its typical form] lies in a distressing feeling in the nature of shame and in the fact that one wishes to hide one's nakedness, as a rule by locomotion, but finds one is unable to do so. I believe the great majority of my readers will have found themselves in this situation in dreams.

The nature of the undress involved is customarily far from clear. The dreamer may say 'I was in my chemise', but this is rarely a distinct picture. The kind of undress is usually so vague that the description is expressed as an alternative: 'I was in my chemise or petticoat.' As a rule the defect in the dreamer's toilet is not so grave as to appear to justify the shame to which it gives rise. In the case of a man who has worn the Emperor's uniform, nakedness is often replaced with some breach of the dress regulations: 'I was walking in the street without my sabre and saw some officers coming up', or 'I was without my necktie', or 'I was wearing civilian check trousers', and so on.

The people in whose presence one feels ashamed are almost always [243]
strangers, with their features left indeterminate. In the typical dream it never happens that the clothing which causes one so much embarrassment is objected to or so much as noticed by the onlookers. On the contrary, they adopt indifferent or (as I observed in one particularly clear dream) solemn and stiff expressions of face. This is a suggestive point.

1 [This paragraph in its present form dates from 1914. It was in the edition of that year (the fourth) that the section on symbolism was added to Chapter VI. This led to considerable alterations in the present section, much of the material in which was transferred to the new section. (See Editors' Introduction, p. xvi f. above.)]

The embarrassment of the dreamer and the indifference of the onlookers offer us, when taken together, a contradiction of the kind that is so common in dreams. It would after all be more in keeping with the dreamer's feelings if strangers looked at him in astonishment and derision or with indignation. But this objectionable feature of the situation has, I believe, been got rid of by wish fulfilment, whereas some force has led to the retention of the other features; and the two portions of the dream are consequently out of harmony with each other. We possess an interesting piece of evidence that the dream in the form in which it appears – partly distorted by wish fulfilment – has not been rightly understood. For it has become the basis of a fairy tale which is familiar to us all in Hans Andersen's version, *The Emperor's New Clothes*, and which has quite recently been put into verse by Ludwig Fulda[1] in his ['dramatic fairy tale'] *Der Talisman*. Hans Andersen's fairy tale tells us how two impostors weave the emperor a costly garment which, they say, will be visible only to persons of virtue and loyalty. The emperor walks out in this invisible garment, and all the spectators, intimidated by the fabric's power to act as a touchstone, pretend not to notice the emperor's nakedness.

This is just the situation in our dream. It is hardly rash to assume that the unintelligibility of the dream's content as it exists in the memory has led to its being recast in a form[t] designed to make sense of the situation. That situation, however, is in the process deprived of its original meaning and put to extraneous uses. But, as we shall see later, it is a common thing for the conscious thought activity of a second psychical system to misunderstand the content of a dream in this way, and this misunderstanding must be regarded as one of the factors in determining the final
[244] form assumed by dreams.[2] Moreover, we shall learn that similar misunderstandings (taking place, once again, within one and the same psychical personality) play a major part in the construction [*Bildung*] of obsessions and phobias.

In the case of our dream we are in a position to indicate the material upon which the misinterpretation is based. The impostor is the dream and the emperor is the dreamer himself; the moralizing purpose of the dream reveals an obscure knowledge of the fact that the latent dream content is concerned with forbidden wishes that have fallen victim to repression. For the context in which dreams of this sort appear during my analyses of neurotics leaves no doubt that they are based upon

1 [German playwright, 1862–1939.]

2 [This process of 'secondary revision' forms the subject of Section I of Chapter VI (p. 437 ff.). Its application to this same fairy tale is discussed in a letter to Fliess of July 7, 1897 (Freud, 1950*a*, Letter 66).]

memories from earliest childhood. It is only in our childhood that we are seen in inadequate clothing both by members of our family and by strangers – nurses, maidservants and visitors; and it is only then that we feel no shame at our nakedness.[1] We can observe how undressing has an almost intoxicating effect on many children even in their later years, instead of making them feel ashamed. They laugh and jump about and slap themselves, while their mother, or whoever else may be there, reproves them and says: 'Ugh! Shocking! You mustn't ever do that!' Children frequently manifest a desire to exhibit. One can scarcely pass through a country village in our part of the world without meeting some child of two or three who lifts up his little shirt in front of one – in one's honour, perhaps. One of my patients has a conscious memory of a scene in his eighth year, when at bedtime he wanted to dance into the next room where his little sister slept, dressed in his nightshirt, but was prevented by his nurse. In the early history of neurotics an important part is played by exposure to children of the opposite sex; in paranoia delusions of being observed while dressing and undressing are to be traced back to experiences of this kind; while among persons who have remained at the stage of perversion there is one class in which this infantile impulse has reached the pitch of a symptom – the class of 'exhibitionists'.[2]

When we look back at this unashamed period of childhood it seems [245]
to us a paradise; and paradise itself is no more than a group phantasy
[*Massenphantasie*][T] of the childhood of the individual. That is why *Masse*
humankind was naked in paradise and man and woman without shame
in one another's presence; till a moment arrived when shame and
anxiety awoke, expulsion followed, and sexual life and the tasks of
cultural activity began. But we can regain this paradise every night in
our dreams. I have already [p. 193 above] expressed a suspicion that
impressions of earliest childhood (that is, from the prehistoric epoch
until about the end of the third year of life) strive to achieve reproduction, from their very nature and irrespectively perhaps of their actual
content, and that their repetition constitutes the fulfilment of a wish.
Thus dreams of being naked are dreams of exhibiting.[3]

1 A child plays a part in the fairy tale as well; for it was a small child who suddenly exclaimed: 'But he has nothing on!'

2 [This allusion to the perversions as remnants of infantile sexual activity foreshadows Freud's analysis of the sexual drive in his *Three Essays* (1905*d*), *RSE*, **7**, 121.]

3 [*Footnote added* 1911:] Ferenczi [1910*a*] has recorded a number of interesting dreams of being naked dreamt by women. There was no difficulty in tracing these back to the infantile desire to exhibit; but they differed in some respects from the 'typical' dreams of being naked which I have discussed in the text. – [The penultimate sentence in the paragraph above seems to adumbrate some of the ideas put forward twenty years later in *Beyond the Pleasure Principle* (Freud, 1920*g*), *RSE*, **18**, 7.]

The core of a dream of exhibiting lies in the figure of the dreamer himself (not as he was as a child but as he appears at the present time) and his inadequate clothing (which emerges indistinctly, whether owing to superimposed layers of innumerable later memories of being in undress or as a result of the censorship). Added to these are the figures of the people in whose presence the dreamer feels ashamed. I know of no instance in which the actual spectators of the infantile scene of exhibiting have appeared in the dream; a dream is scarcely ever a simple memory. Curiously enough, the people upon whom our sexual interest was directed in childhood are omitted in all the reproductions which occur in dreams, in hysteria and in obsessional neurosis. It is only in paranoia that these spectators reappear and, though they remain invisible, their presence is inferred with fanatical conviction. What takes their place in dreams – 'a lot of strangers' who take no notice of the spectacle that is offered – is nothing more nor less than the wishful contrary of the single familiar individual before whom the dreamer exposed himself. Incidentally, 'a lot of strangers' frequently appear in
[246] dreams in many other connections, and they always stand as the wishful contrary of 'secrecy'.[1] It is to be noticed that even in paranoia, where the original state of things is restored, this reversal into a contrary is observed. The subject feels that he is no longer alone, he has no doubt that he is being observed, but the observers are 'a lot of strangers' whose identity is left curiously vague.

In addition to this, repression plays a part in dreams of exhibiting; for the distress felt in such dreams is a reaction on the part of the second system against the content of the scene of exhibiting having found expression in spite of the ban upon it. If the distress was to be avoided, the scene should never have been revived.

We shall return later [p. 299 ff.] to the feeling of being inhibited. It serves admirably in dreams to represent a *conflict of will* or a *negative*. The unconscious purpose requires the exhibiting to proceed; the censorship demands that it shall be stopped.

There can be no doubt that the connections between our typical dreams and fairy tales and the material of other kinds of creative writing [*Dichtungsstoffen*] are neither few nor accidental. It sometimes happens that the sharp eye of a creative writer has an analytic realization of the process of transformation of which he is habitually no more than the

1 [This point is also mentioned towards the end of Freud's paper on 'Screen Memories' (1899*a*), *RSE*, **3**, 309 f. – *Footnote added* 1909:] For obvious reasons the presence of 'the whole family' in a dream has the same significance.

tool. If so, he may follow the process in a reverse direction and so trace back the imaginative writing to a dream. One of my friends has drawn my attention to the following passage in Gottfried Keller's *Der grüne Heinrich* [Part III, Chapter 2]: 'I hope, my dear Lee, that you may never learn from your own personal experience the peculiar and *piquant* truth of the plight of Odysseus when he appeared, naked and covered with mud, before the eyes of Nausicaä and her maidens! Shall I tell you how that can happen? Let us look into our example. If you are wandering about in a foreign land, far from your home and from all that you hold dear, if you have seen and heard many things, have known sorrow and care, and are wretched and forlorn, then without fail you will dream one night that you are coming near to your home; you will see it gleaming and shining in the fairest colours, and the sweetest, dearest and most beloved forms will move towards you. Then suddenly you will become [247] aware that you are in rags, naked and dusty. You will be seized with a nameless shame and dread, you will seek to find covering and to hide yourself, and you will awake bathed in sweat. This, so long as men breathe, is the dream of the unhappy wanderer; and Homer has evoked the picture of his plight from the deepest and eternal nature of man.'

The deepest and eternal nature of man, upon whose evocation in his hearers the poet is accustomed to rely, lies in those impulses of the mind which have their roots in a childhood that has since become prehistoric. Suppressed and forbidden wishes from childhood break through in the dream behind the exile's unobjectionable wishes which are capable of entering consciousness; and that is why the dream which finds concrete expression in the legend of Nausicaä ends as a rule as an anxiety dream.

My own dream (recorded on p. 211) of running upstairs and of soon afterwards finding myself glued to the steps was equally a dream of exhibiting, since it bears the essential marks of being one. It should be possible, therefore, to trace it back to experiences during my childhood, and if these could be discovered they should enable us to judge how far the maidservant's behaviour to me – her accusing me of dirtying the carpet – helped to give her her place in my dream. I can, as it happens, provide the necessary particulars. In a psychoanalysis one learns to interpret propinquity in time as representing connection in subject matter. [See below, p. 279 f.] Two thoughts which occur in immediate sequence without any apparent connection are in fact part of a single unity which has to be discovered; in just the same way, if I write an '*a*' and a '*b*' in succession, they have to be pronounced as a single syllable '*ab*'. The same is true of dreams. The staircase dream to which I have

referred was one of a series of dreams; and I understood the interpretation of the other members of the series. Since this particular dream was surrounded by the others it must have dealt with the same subject. Now these other dreams were based on a recollection of a nurse in whose charge I had been from some date during my earliest infancy till I was two and a half. I even retain an obscure conscious memory of her. According to what I was told not long ago by my mother, she was old
[248] and ugly, but very sharp and efficient. From what I can infer from my own dreams her treatment of me was not always excessive in its amiability and her words could be harsh if I failed to reach the required standard of cleanliness. And thus the maidservant, since she had undertaken the job of carrying on this educational work, acquired the right to be treated in my dream as a reincarnation of the prehistoric old nurse. It is reasonable to suppose that the child loved the old woman who taught him these lessons, in spite of her rough treatment of him.[1]

(*β*) *Dreams of the Death of Persons of whom the Dreamer is Fond*

Another group of dreams which may be described as typical are those containing the death of some loved relative – for instance, of a parent, of a brother or sister, or of a child. Two classes of such dreams must at once be distinguished: those in which the dreamer is unaffected by grief, so that on awakening he is astonished at his lack of feeling, and those in which the dreamer feels deeply pained by the death and may even weep bitterly in his sleep.

We need not consider the dreams of the first of these classes, for they have no claim to be regarded as 'typical'. If we analyse them, we find that they have some meaning other than their apparent one, and that they are intended to conceal some other wish. Such was the dream of the aunt who saw her sister's only son lying in his coffin. (See p. 135.) It did not mean that she wished her little nephew dead; as we have seen, it merely concealed a wish to see a particular person of whom she was fond and whom she had not met for a long time – a person whom she had once before met after a similarly long interval beside the coffin of

1 Here is an 'overinterpretation' of the same dream. Since '*spuken* [haunting]' is an activity of *spirits*, '*spucken* [spitting] on the stairs' might be loosely rendered as '*esprit d'escalier*'. This last phrase is equivalent to lack of ready repartee ['*Schlagfertigkeit*', literally 'readiness to strike'] – a failing to which I must in fact plead guilty. Was my nurse, I wonder, equally wanting in that quality? [This nurse is referred to in Chapter IV of *The Psychopathology of Everyday Life* (Freud, 1901*b*), *RSE*, **6**, 44 f., and in greater detail in his letters to Fliess of October 3 and 4, and October 15, 1897 (Freud, 1950*a*, Letters 70 and 71).]

another nephew. This wish, which was the true content of the dream, gave no occasion for grief, and no grief, therefore, was felt in the dream. It will be noticed that the affect felt in the dream belongs to its latent and not to its manifest content, and that the dream's *affective* content [249] has remained untouched by the distortion which has overtaken its *ideational* content.[1]

Very different are the dreams of the other class – those in which the dreamer imagines the death of a loved relative and is at the same time painfully affected. The meaning of such dreams, as their content indicates, is a wish that the person in question may die. And since I must expect that the feelings of all of my readers and any others who have experienced similar dreams will rebel against my assertion, I must try to base my evidence for it on the broadest possible foundation.

I have already discussed a dream which taught us that the wishes which are represented in dreams as fulfilled are not always present-day wishes. They may also be wishes of the past which have been abandoned, overlaid and repressed, and to which we have to attribute some sort of continued existence only because of their re-emergence in a dream. They are not dead in our sense of the word but only like the shades in the Odyssey, which awoke to some sort of life as soon as they had tasted blood. In the dream of the dead child in the 'case' (p. 136 f.) what was involved was a wish which had been an immediate one fifteen years earlier and was frankly admitted as having existed at that time. I may add – and this may not be without its bearing upon the theory of dreams – that even behind this wish there lay a memory from the dreamer's earliest childhood. When she was a small child – the exact date could not be fixed with certainty – she had heard that her mother had fallen into a deep depression during the pregnancy of which she had been the fruit and had passionately wished that the child she was bearing might die. When the dreamer herself was grown up and pregnant, she merely followed her mother's example.

If anyone dreams, with every sign of pain, that his father or mother or brother or sister has died, I should never use the dream as evidence that he wishes for that person's death *at the present time*. The theory of dreams does not require as much as that; it is satisfied with the inference that this death has been wished for at some time or other during the dreamer's childhood. I fear, however, that this reservation will not appease the objectors; they will deny the possibility of their *ever* having [250] had such a thought with just as much energy as they insist that they

1 [See the discussion on affects in dreams in Chapter VI, Section H (especially p. 414).]

harbour no such wishes now. I must therefore reconstruct a portion of the vanished mental life of children on the basis of the evidence of the present.[1]

Let us first consider the relation of children to their brothers and sisters. I do not know why we presuppose that that relation must be a loving one; for instances of hostility between adult brothers and sisters force themselves upon everyone's experience and we can often establish the fact that the disunity originated in childhood or has always existed. But it is further true that a great many adults, who are on affectionate terms with their brothers and sisters and are ready to stand by them today, passed their childhood on almost unbroken terms of enmity with them. The elder child ill-treats the younger, maligns him and robs him of his toys; while the younger is consumed with impotent rage against the elder, envies and fears him, or meets his oppressor with the first stirrings of a love of liberty and a sense of justice. Their parents complain that the children do not get on with one another, but cannot discover why. It is easy to see that the character of even a good child is not what we should wish to find it in an adult. Children are completely egoistic [*egoistisch*]; they feel their needs intensely and strive ruthlessly to satisfy them – especially as against the rivals, other children, and first and foremost as against their brothers and sisters. But we do not on that account call a child 'bad', we call him 'naughty'; he is no more answerable for his evil deeds in our judgement than in the eyes of the law. And it is right that this should be so; for we may expect that, before the end of the period which we count as childhood, altruistic impulses and morality will awaken in the little egoist and (to use Meynert's terms [e.g. 1892, 169 ff.]) a secondary ego [*sekundares Ich*] will overlay and inhibit the primary one. It is true, no doubt, that morality does not set in simultaneously all along the line and that the length of non-moral childhood varies in different individuals. If this morality fails to develop, we like to talk of 'degeneracy', though what in fact faces us is an inhibition
[251] in development. After the primary character has already been overlaid by later development, it can still be laid bare again, at all events in part, in cases of hysterical illness. There is a really striking resemblance between what is known as the hysterical character and that of a naughty child. Obsessional neurosis, on the contrary, corresponds to a supermorality imposed as a reinforcing weight upon fresh stirrings [*wieder regenden*][T] of the primary character.

Regung

1 [*Footnote added* 1909:] Cf. my 'Analysis of a Phobia in a Five-Year-Old-Boy' (1909*b*) and my paper 'On the Sexual Theories of Children' (1908*c*). [*RSE*, **10**, 5 ff., and **9**, 183 ff.]

Many people, therefore, who love their brothers and sisters and would feel bereaved if they were to die, harbour evil wishes against them in their unconscious, dating from earlier times; and these are capable of being realized in dreams.

It is of quite particular interest, however, to observe the behaviour of small children up to the age of two or three or a little older towards their younger brothers and sisters. Here, for instance, was a child who had so far been the only one; and now he was told that the stork had brought a new baby. He looked the new arrival up and down and then declared decisively: 'The stork should take it away again!'[1] I am quite seriously of the opinion that a child can form a just estimate of the setback he has to expect at the hands of the little stranger. A lady of my acquaintance, who is on very good terms today with a sister four years her junior, tells me that she greeted the news of her first arrival with this qualification: 'But all the same I shan't give her my red cap.' Even if a child only comes to realize the situation later on, his hostility will date from that moment. I know of a case in which a little girl of less than three tried to strangle an infant in its cradle because she felt that its continued presence boded her no good. Children at that time of life are capable of jealousy of any degree of intensity and obviousness. Again, if it should happen that the baby sister does in fact disappear after a short while, the elder child will find the whole affection of the household once more concentrated upon himself. If after that the stork should bring yet another baby, it seems only logical that the little favourite [252] should nourish a wish that his new competitor may meet with the same fate as the earlier one, so that he himself may be as happy as he was originally and during the interval.[2] Normally, of course, this attitude of a child towards a younger brother or sister is a simple function of the difference between their ages. Where the gap in time is sufficiently long, an elder girl will already begin to feel the stirring [*regen*] of her maternal instincts [*Instinkte*] towards the helpless newborn baby.

1 [*Footnote added* 1909:] The three-and-a-half-year-old Hans (whose phobia was the subject of the analysis mentioned in the preceding footnote) exclaimed shortly after the birth of a sister, while he was suffering from a feverish sore throat: 'I don't *want* a baby sister!' [Freud, 1909*b*, Section I.] During his neurosis eighteen months later he frankly confessed to a wish that his mother might drop the baby into the bath so that she would die. [Ibid., Section II (April 11).] At the same time, Hans was a good-natured and affectionate child, who soon grew fond of this same sister and particularly enjoyed taking her under his wing.

2 [*Footnote added* 1914:] Deaths that are experienced in this way in childhood may quickly be forgotten in the family; but psychoanalytic research shows that they have a very important influence on subsequent neuroses.

Hostile feelings towards brothers and sisters must be far more frequent in childhood than the unseeing eye of the adult observer can perceive.[1]

In the case of my own children, who followed each other in rapid succession, I neglected the opportunity of carrying out observations of this kind; but I am now making up for this neglect by observing a small nephew, whose autocratic rule was upset, after lasting for fifteen months, by the appearance of a female rival. I am told, it is true, that the young man behaves in the most chivalrous manner to his little sister, that he kisses her hand and strokes her; but I have been able to convince myself that even before the end of his second year he made use of his powers of speech for the purpose of criticizing someone whom he could not fail to regard as superfluous. Whenever the conversation touched upon her he used to intervene in it and exclaim petulantly: 'Too 'ickle! too 'ickle!' [253] During the last few months the baby's growth has made enough progress to place her beyond this particular ground for contempt, and the little boy has found a different basis for his assertion that she does not deserve so much attention: at every suitable opportunity he draws attention to the fact that she has no teeth.[2] We all of us recollect how the eldest girl of another of my sisters, who was then a child of six, spent half an hour in insisting upon each of her aunts in succession agreeing with her: 'Lucie can't understand that yet, can she?' she kept asking. Lucie was her rival – two and a half years her junior.

In none of my women patients, to take an example, have I failed to come upon this dream of the death of a brother or sister, which tallies with an increase in hostility. I have found only a single exception; and it was easy to interpret this as a confirmation of the rule. On one occasion during an analytic session I was explaining this subject to a lady, since in view of her symptom its discussion seemed to me relevant. To my astonishment she replied that she had never had such a

1 [*Footnote added* 1914:] Since this was written, a large number of observations have been made and recorded in the literature of psychoanalysis upon the originally hostile attitude of children towards their brothers and sisters and one of their parents. The [Swiss] author and poet Spitteler has given us a particularly genuine and naive account of this childish attitude, derived from his own childhood [1914, 40]: 'Moreover, there was a second Adolf there: a little creature who they alleged was my brother, though I could not see what use he was and still less why they made as much fuss of him as of me myself. I was sufficient so far as I was concerned; why should I want a brother? And he was not merely useless, he was positively in the way. When I pestered my grandmother, he wanted to pester her too. When I was taken out in the perambulator, he sat opposite to me and took up half the space, so that we were bound to kick each other with our feet.'

2 [*Footnote added* 1909:] Little Hans, when he was three and a half, gave vent to a crushing criticism of his sister in the same words. It was because of her lack of teeth, he supposed, that she was unable to talk. [Freud, 1909*b*, Section I; *RSE*, **10**, 9.]

dream. Another dream, however, occurred to her, which ostensibly had no connection with the topic – a dream which she had first dreamt when she was four years old and at that time the youngest of the family, and which she had dreamt repeatedly since: *A whole crowd of children – all her brothers, sisters and cousins of both sexes – were romping in a field. Suddenly they all grew wings, flew away and disappeared*. She had no idea what this dream meant; but it is not hard to recognize that in its original form it had been a dream of the death of all her brothers and sisters, and had been only slightly influenced by the censorship. I may venture to suggest the following analysis. On the occasion of the death of one of this crowd of children (in this instance the children of two brothers had been brought up together as a single family) the dreamer, not yet four years old at the time, must have asked some wise grown-up person what became of children when they were dead. The reply must have been: 'They grow wings and turn into little angels.' In the dream which followed upon this piece of information all the dreamer's brothers and sisters had wings like angels and – which is the main point – flew away. Our little baby- [254]
killer was left alone, strange to say: the only survivor of the whole crowd! We can hardly be wrong in supposing that the fact of the children romping in a *field* before flying away points to butterflies. It is as though the child was led by the same chain of thought as the peoples of antiquity to picture the soul as having a butterfly's wings.

At this point someone will perhaps interrupt: 'Granted that children have hostile impulses towards their brothers and sisters, how can a child's mind reach such a pitch of depravity as to wish for the *death* of his rivals or of playmates stronger than himself, as though the death penalty were the only punishment for every crime?' Anyone who talks like this has failed to bear in mind that a child's idea of being 'dead' has nothing much in common with ours apart from the word. Children know nothing of the horrors of corruption, of freezing in the ice-cold grave, of the terrors of eternal nothingness – ideas which grown-up people find it so hard to tolerate, as is proved by all the myths of a future life. The fear of death has no meaning to a child; hence it is that he will play with the dreadful word and use it as a threat against a playmate: 'If you do that again, you'll die, like Franz!' Meanwhile the poor mother gives a shudder and remembers, perhaps, that the greater half of the human race fail to survive their childhood years. It was actually possible for a child, who was over eight years old at the time, coming home from a visit to the Natural History

Museum, to say to his mother: 'I'm so fond of you, Mummy: when you die I'll have you stuffed and I'll keep you in this room, so that I can see you *all* the time.' So little resemblance is there between a child's idea of being dead and our own![1]

To children, who, moreover, are spared the sight of the scenes of suffering which precede death, being 'dead' means approximately the same as being 'gone' – not troubling the survivors any longer. A child makes no distinction as to how this absence is brought about: whether it is due
[255] to a journey, to a dismissal, to an estrangement, or to death.[2] If, during a child's prehistoric epoch, his nurse has been dismissed, and if soon afterwards his mother has died, the two events are superimposed on each other in a single series in his memory as revealed in analysis. When people are absent, children do not miss them with any great intensity; many mothers have learnt this to their sorrow when, after being away from home for some weeks on a summer holiday, they are met on their return by the news that the children have not once asked after their mummy. If their mother does actually make the journey to that 'undiscover'd country, from whose bourn no traveller returns', children seem at first to have forgotten her, and it is only later on [*nachträglich*] that they begin to call their dead mother to mind.

Thus if a child has reasons for wishing the absence of another, there is nothing to restrain him from giving his wish the form of the other child being dead. And the psychical reaction to dreams containing death wishes proves that, in spite of the different content of these wishes in the case of children, they are nevertheless in some way or other the same as wishes expressed in the same terms by adults.[3]

1 [*Footnote added* 1909:] I was astonished to hear a highly intelligent boy of ten remark after the sudden death of his father: 'I know father's dead, but what I can't understand is why he doesn't come home to supper.' – [*Added* 1919:] Further material on this subject can be found in the first [seven] volumes of the periodical *Imago* [1912–21], under the standing rubric of '*Vom wahren Wesen der Kinderseele*' ['The True Nature of the Child Mind'], edited by Frau Dr H. von Hug-Hellmuth.

2 [*Footnote added* 1919:] An observation made by a parent who had a knowledge of psychoanalysis caught the actual moment at which his highly intelligent four-year-old daughter perceived the distinction between being 'gone' and being 'dead'. The little girl had been troublesome at mealtime and noticed that one of the maids at the pension where they were staying was looking at her askance. 'I wish Josefine was dead,' was the child's comment to her father. 'Why dead?' enquired her father soothingly; 'wouldn't it do if she went away?' 'No,' replied the child; 'then she'd come back again.' The unbounded self-love (the narcissism) of children regards any interference as an act of *lèse-majesté*; and their feelings demand (like the Draconian code) that any such crime shall receive the one form of punishment which admits of no degrees.

3 [The adult attitude to death is discussed by Freud more particularly in the second essay of his *Totem and Taboo* (1912–13*a*), Section 3 (*c*); *RSE*, **13**, 62 ff., in his paper on 'The Three Caskets' (1913*f*), ibid., **12**, 296 f., and in the second part of his 'Thoughts for the Times on War and Death' (1915*b*), ibid., **14**, 288 ff.]

If, then, a child's death wishes against his brothers and sisters are explained by the childish egoism which makes him regard them as his rivals, how are we to explain his death wishes against his parents, who surround him with love and fulfil his needs and whose preservation that same egoism should lead him to desire?

A solution to this difficulty is afforded by the observation that dreams [256] of the death of parents apply with preponderant frequency to the parent who is of the same sex as the dreamer: that men, that is, dream mostly of their father's death and women of their mother's. I cannot pretend that this is universally so, but the preponderance in the direction I have indicated is so evident that it needs to be explained by a factor of general importance.[1] It is as though – to put it bluntly – a sexual preference were making itself felt at an early age: as though boys regarded their fathers and girls their mothers as their rivals in love, whose elimination could not fail to be to their advantage.

Before this idea is rejected as a monstrous one, it is as well in this case, too, to consider the real relations obtaining – this time between parents and children. We must distinguish between what the cultural standards of filial piety demand of this relation and what everyday observation shows it in fact to be. More than one occasion for hostility lies concealed in the relation between parents and children – a relation which affords the most ample opportunities for wishes to arise which cannot pass the censorship.

Let us consider first the relation between father and son. The sanctity which we attribute to the rules laid down in the Decalogue has, I think, blunted our powers of perceiving the real facts. We seem scarcely to venture to observe that the majority of mankind disobey the Fifth Commandment. Alike in the lowest and in the highest strata of human society filial piety is wont to give way to other interests. The obscure information which is brought to us by mythology and legend from the primaeval ages of human society gives an unpleasing picture of the father's despotic power and of the ruthlessness with which he made use of it. Kronos devoured his children, just as the wild boar devours the sow's litter; while Zeus emasculated his father[2] and made himself ruler in his place. The more unrestricted was the [257]

1 [*Footnote added* 1925:] The situation is often obscured by the emergence of a self-punitive impulse, which threatens the dreamer, by way of a moral reaction, with the loss of the parent whom he loves.

2 [*Footnote added* 1909:] Or so he is reported to have done according to some myths. According to others, emasculation was only carried out by Kronos on his father Uranus. [This passage is discussed in Chapter X (3) of *The Psychopathology of Everyday Life* (Freud, 1901*b*), *RSE*, **6**, 188.]

rule of the father in the ancient family, the more must the son, as his destined successor, have found himself in the position of an enemy, and the more impatient must he have been to become ruler himself through his father's death. Even in our middle-class families fathers are as a rule inclined to refuse their sons independence and the means necessary to secure it and thus to foster the growth of the germ of hostility which is inherent in their relation. A physician will often be in a position to notice how a son's grief at the loss of his father cannot suppress his satisfaction at having at length won his freedom. In our society today fathers are apt to cling desperately to what is left of a now sadly antiquated *potestas patris familias*; and an author who, like Ibsen, brings the immemorial struggle between fathers and sons into prominence in his writings may be certain of producing his effect.

Occasions for conflict between a daughter and her mother arise when the daughter begins to grow up and long for sexual liberty, but finds herself under her mother's tutelage; while the mother, on the other hand, is warned by her daughter's growth that the time has come when she herself must abandon her claims to sexual satisfaction.

All of this is patent to the eyes of everyone. But it does not help us in our endeavour to explain dreams of a parent's death in people whose piety towards their parents has long been unimpeachably established. Previous discussions, moreover, will have prepared us to learn that the death wish against parents dates back to earliest childhood.

This supposition is confirmed with a certainty beyond all doubt in the case of psychoneurotics when they are subjected to analysis. We learn from them that a child's sexual wishes – if in their embryonic stage they deserve to be so described – awaken very early, and that a girl's first affection is for her father[1] and a boy's first childish desires are for his mother. Accordingly, the father becomes a disturbing rival to the boy and the mother to the girl; and I have already shown in the case of brothers and sisters how easily such feelings can lead to a death wish.
[258] The parents too give evidence as a rule of sexual partiality: a natural predilection usually sees to it that a man tends to spoil his little daughters, while his wife takes her sons' part; though both of them, where their judgement is not disturbed by the magic of sex, keep a strict eye upon their children's education. The child is very well aware of this

For the mythological significance of this theme, cf. Rank, 1909, [*added* 1914:] and Rank, 1912*c*, Chapter IX, Section 2. – [These sentences in the text are, of course, an early hint at the line of thought developed later by Freud in his *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 130 ff.]

1 [Freud's views on this point were later modified. Cf. Freud (1925*j*), ibid., **19**, 252, and (1931*b*), ibid., **21**, 218.]

partiality and turns against that one of his parents who is opposed to showing it. Being loved by an adult does not merely bring a child the satisfaction of a special need; it also means that he will get what he wants in every other respect as well. Thus he will be following his own sexual drive and at the same time giving fresh strength to the inclination shown by his parents if his choice between them falls in with theirs.

The signs of these infantile preferences are for the most part overlooked; yet some of them are to be observed even after the first years of childhood. An eight-year-old girl of my acquaintance, if her mother is called away from the table, makes use of the occasion to proclaim herself her successor: '*I*'m going to be Mummy now. Do you want some more greens, Karl? Well, help yourself, then!' and so on. A particularly gifted and lively girl of four, in whom this piece of child psychology is especially transparent, declared quite openly: 'Mummy can go away now. Then Daddy must marry me and I'll be his wife.' Such a wish occurring in a child is not in the least inconsistent with her being tenderly attached to her mother. If a little boy is allowed to sleep beside his mother when his father is away from home, but has to go back to the nursery and to someone of whom he is far less fond as soon as his father returns, he may easily begin to form a wish that his father should *always* be away, so that he himself could keep his place beside his dear, lovely Mummy. One obvious way of attaining this wish would be if his father were dead; for the child has learnt one thing by experience – namely that 'dead' people, such as Grandaddy, are always away and never come back.

Though observations of this kind on small children fit in perfectly with the interpretation I have proposed, they do not carry such complete conviction as is forced upon the physician by psychoanalyses of adult neurotics. In the latter case dreams of the sort we are considering are introduced into the analysis in such a context that it is impossible to avoid interpreting them as *wishful* dreams.

One day one of my women patients was in a distressed and tearful [259]
mood. 'I don't want ever to see my relations again,' she said, 'they must think me horrible.' She then went on, with almost no transition, to say that she remembered a dream, though of course she had no idea what it meant. When she was four years old she had a dream that *a lynx or fox*[1] *was walking on the roof; then something had fallen down or she had fallen down; and then her mother was carried out of the house dead* – and she wept bitterly. I told her that this dream must mean that when

1 [The German names for these animals are very much alike: '*Luchs*' and '*Fuchs*'.]

she was a child she had wished she could see her mother dead, and that it must be on account of the dream that she felt her relations must think her horrible. I had scarcely said this when she produced some material which threw light on the dream. 'Lynx eye' was a term of abuse that had been thrown at her by a street urchin when she was a very small child. When she was three years old, a tile off the roof had fallen on her mother's head and made it bleed violently.

I once had an opportunity of making a detailed study of a young woman who passed through a variety of psychical conditions. Her illness began with a state of confusional excitement during which she displayed a quite special aversion to her mother, hitting and abusing her whenever she came near her bed, while at the same period she was docile and affectionate towards a sister who was many years her senior. This was followed by a state in which she was lucid but somewhat apathetic and suffered from badly disturbed sleep. It was during this phase that I began treating her and analysing her dreams. An immense number of these dreams were concerned, with a greater or lesser degree of disguise, with the death of her mother: at one time she would be attending an old woman's funeral, at another she and her sister would be sitting at table dressed in mourning. There could be no question as to the meaning of these dreams. As her condition improved still further, hysterical phobias developed. The most tormenting of these was a fear that something might have happened to her mother. She was obliged to hurry home, wherever she might be, to convince herself that her mother was still alive. This case, taken in conjunction with what I had learnt from other sources, was highly
[260] instructive: it exhibited, translated as it were into different languages, the various ways in which the psychical apparatus reacted to one and the same exciting idea. In the confusional state, in which, as I believe, the second psychical agency was overwhelmed by the normally suppressed first one, her unconscious hostility to her mother found a powerful *motor* expression. When the calmer condition set in, when the rebellion was suppressed and the domination of the censorship re-established, the only region left open in which her hostility could realize the wish for her mother's death was that of dreaming. When a normal state was still more firmly established, it led to the production of her exaggerated worry about her mother as a hysterical counterreaction and defensive phenomenon. In view of this it is no longer hard to understand why hysterical girls are so often attached to their mothers with such exaggerated affection.

On another occasion I had an opportunity of obtaining a deep insight into the unconscious mind of a young man whose life was made almost impossible by an obsessional neurosis. He was unable to go out into the street because he was tortured by the fear that he would kill everyone he met. He spent his days in preparing his alibi in case he might be charged with one of the murders committed in the town. It is unnecessary to add that he was a man of equally high morals and education. The analysis (which, incidentally, led to his recovery) showed that the basis of this distressing obsession was an impulse to murder his somewhat over-severe father. This impulse, to his astonishment, had been consciously expressed when he was seven years old, but it had, of course, originated much earlier in his childhood. After his father's painful illness and death, the patient's obsessional self-reproaches appeared – he was in his thirty-first year at the time – taking the shape of a phobia transferred on to strangers. A person, he felt, who was capable of wanting to push his own father over a precipice from the top of a mountain was not to be trusted to respect the lives of those less closely related to him; he was quite right to shut himself up in his room.[1]

In my experience, which is already extensive, the chief part in the mental lives of all children who later become psychoneurotics is played by their parents. Being in love with the one parent and hating the other are among the essential constituents of the stock of psychical impulses [261]
[*Regungen*] which is formed at that time and which is of such importance in determining the symptoms of the later neurosis. It is not my belief, however, that psychoneurotics differ sharply in this respect from other human beings who remain normal – that they are able, that is, to create something absolutely new and peculiar to themselves. It is far more probable – and this is confirmed by occasional observations on normal children – that they are only distinguished by exhibiting on a magnified scale feelings of love and hatred to their parents which occur less obviously and less intensely in the minds of most children.

This discovery is confirmed by a legend that has come down to us from classical antiquity: a legend whose profound and universal power to move can only be understood if the hypothesis I have put forward in regard to the psychology of children has an equally universal validity. What I have in mind is the legend of King Oedipus and Sophocles' drama which bears his name.

1 [This patient is referred to again on p. 409 f. below.]

Oedipus, son of Laïus, King of Thebes, and of Jocasta, was exposed as an infant because an oracle had warned Laïus that the still unborn child would be his father's murderer. The child was rescued, and grew up as a prince in an alien court, until, in doubts as to his origin, he too questioned the oracle and was warned to avoid his home since he was destined to murder his father and take his mother in marriage. On the road leading away from what he believed was his home, he met King Laïus and slew him in a sudden quarrel. He came next to Thebes and solved the riddle set him by the Sphinx who barred his way. Out of gratitude the Thebans made him their king and gave him Jocasta's hand in marriage. He reigned long in peace and honour, and she who, unknown to him, was his mother bore him two sons and two daughters. Then at last a plague broke out and the Thebans made enquiry once more of the oracle. It is at this point that Sophocles' tragedy opens. The messengers bring back the reply that the plague will cease when the murderer of Laïus has been driven from the land.

> But he, where is he? Where shall now be read
> The fading record of this ancient guilt?[1]

[262] The action of the play consists in nothing other than the process of revealing, with cunning delays and ever-mounting excitement – a process that can be likened to the work of a psychoanalysis – that Oedipus himself is the murderer of Laïus, but further that he is the son of the murdered man and of Jocasta. Appalled at the abomination which he has unwittingly perpetrated, Oedipus blinds himself and forsakes his home. The oracle has been fulfilled.

Oedipus Rex is what is known as a tragedy of destiny. Its tragic effect is said to lie in the contrast between the supreme will of the gods and the vain attempts of mankind to escape the evil that threatens them. The lesson which, it is said, the deeply moved spectator should learn from the tragedy is submission to the divine will and realization of his own impotence. Modern dramatists have accordingly tried to achieve a similar tragic effect by weaving the same contrast into a plot invented by themselves. But the spectators have looked on unmoved while a curse or an oracle was fulfilled in spite of all the efforts of some innocent man: later tragedies of destiny have failed in their effect.

If *Oedipus Rex* moves a modern audience no less than it did the contemporary Greek one, the explanation can only be that its effect does not lie in the contrast between destiny and human will, but is to be

1 [Lewis Campbell's translation (1883), line 108 f.]

looked for in the particular nature of the material on which that contrast is exemplified. There must be something which makes a voice within us ready to recognize the compelling force of destiny in the *Oedipus*, while we can dismiss as merely arbitrary such dispositions as are laid down in [Grillparzer's] *Die Ahnfrau* or other modern tragedies of destiny. And a factor of this kind is, in fact, involved in the story of King Oedipus. His destiny moves us only because it might have been ours – because the oracle laid the same curse upon us before our birth as upon him. It is the fate of all of us, perhaps, to direct our first sexual impulse towards our mother and our first hatred and our first murderous wish against our father. Our dreams convince us that that is so. King Oedipus, who slew his father Laïus and married his mother Jocasta, merely shows us the fulfilment of our own childhood wishes. But, more fortunate than he, we have meanwhile succeeded, insofar as we have not become psychoneurotics, in detaching our sexual impulses from our mothers and in forgetting our jealousy of our fathers. Here is one in whom these primaeval wishes of our childhood have been fulfilled, and we shrink back [263] from him with the whole force of the repression by which those wishes have since that time been held down within us. While the poet, as he unravels the past, brings to light the guilt of Oedipus, he is at the same time compelling us to recognize our own inner minds, in which those same impulses, though suppressed, are still to be found. The contrast with which the closing Chorus leaves us confronted –

> . . . Fix on Oedipus your eyes,
> Who resolved the dark enigma, noblest champion and most wise.
> Like a star his envied fortune mounted beaming far and wide:
> Now he sinks in seas of anguish, whelmed beneath a raging tide . . .[1]

– strikes as a warning at ourselves and our pride, at us who since our childhood have grown so wise and so mighty in our own eyes. Like Oedipus, we live in ignorance of these wishes, repugnant to morality, which have been forced upon us by Nature, and after their revelation we may all of us well seek to close our eyes to the scenes of our childhood.[2]

1 [Lewis Campbell's translation, line 1524 ff.]

2 [*Footnote added* 1914:] None of the findings of psychoanalytic research has provoked such embittered denials, such fierce opposition – or such amusing contortions – on the part of critics as this indication of the childhood impulses towards incest which persist in the unconscious. An attempt has even been made recently to make out, in the face of all experience, that the incest should only be taken as 'symbolic'. – Ferenczi (1912*c*) has proposed an ingenious 'overinterpretation' of the Oedipus myth, based on a passage in one of Schopenhauer's letters. – [*Added* 1919:] Later studies have shown that the 'Oedipus complex', which was touched upon

There is an unmistakable indication in the text of Sophocles' tragedy itself that the legend of Oedipus sprang from some primaeval dream material which had as its content the distressing disturbance of a child's
[264] relation to his parents owing to the first stirrings [*Regungen*] of sexuality. At a point when Oedipus, though he is not yet enlightened, has begun to feel troubled by his recollection of the oracle, Jocasta consoles him by referring to a dream which many people dream, though, as she thinks, it has no meaning:

> Many a man ere now in dreams hath lain
> With her who bare him. He hath least annoy
> Who with such omens troubleth not his mind.[1]

Today, just as then, many men dream of having sexual relations with their mothers, and speak of the fact with indignation and astonishment. It is clearly the key to the tragedy and the complement to the dream of the dreamer's father being dead. The story of Oedipus is the reaction of the imagination to these two typical dreams. And just as these dreams, when dreamt by adults, are accompanied by feelings of repulsion, so too the legend must include horror and self-punishment. Its further modification originates once again in a misconceived secondary revision of the material, which has sought to exploit it for theological purposes. (Cf. the dream material in dreams of exhibiting, p. 215 ff.) The attempt to harmonize divine omnipotence with human responsibility must naturally fail in connection with this subject matter just as with any other.

Another of the great creations of tragic poetry, Shakespeare's *Hamlet*, has its roots in the same soil as *Oedipus Rex*.[2] But the changed treatment of the same material reveals the whole difference in the mental life of these two widely separated epochs of civilization: the secular advance of repression in the emotional life of mankind. In the *Oedipus* the child's

for the first time in the above paragraphs in *The Interpretation of Dreams*, throws a light of undreamt-of importance on the history of the human race and the evolution of religion and morality. (See my *Totem and Taboo*, 1912–13*a* [Essay IV].) – [Actually the gist of this discussion of the Oedipus complex and of the *Oedipus Rex*, as well as of what follows on the subject of *Hamlet*, had already been put forward by Freud in a letter to Fliess as early as October 15, 1897. (See Freud, 1950*a*, Letter 71.) A still earlier hint at the discovery of the Oedipus complex was included in a letter of May 31, 1897. (Ibid., Draft N.) – The actual term 'Oedipus complex' seems to have been first used by Freud in his published writings in the first of his 'Contributions to the Psychology of Love' (1910*h*), *RSE*, **11**, 158.]

1 [Lewis Campbell's translation, line 982 ff.]

2 [This paragraph was printed as a footnote in the first edition (1900) and included in the text from 1914 onwards.]

wishful phantasy that underlies it is brought into the open and realized as it would be in a dream. In *Hamlet* it remains repressed; and – just as in the case of a neurosis – we only learn of its existence from its inhibiting consequences. Strangely enough, the overwhelming effect produced by the more modern tragedy has turned out to be compatible with the fact that people have remained completely in the dark as to the hero's character. The play is built up on Hamlet's hesitations over fulfilling the task of revenge that is assigned to him; but its text offers no reasons or [265] motives for these hesitations and an immense variety of attempts at interpreting them have failed to produce a result. According to the view which was originated by Goethe and is still the prevailing one today, Hamlet represents the type of man whose power of direct action is paralysed by an excessive development of his intellect. (He is 'sicklied o'er with the pale cast of thought'.) According to another view, the dramatist has tried to portray a pathologically irresolute character which might be classed as neurasthenic. The plot of the drama shows us, however, that Hamlet is far from being represented as a person incapable of taking any action. We see him doing so on two occasions: first in a sudden outburst of temper, when he runs his sword through the eavesdropper behind the arras, and secondly in a premeditated and even crafty fashion, when, with all the callousness of a Renaissance prince, he sends the two courtiers to the death that had been planned for himself. What is it, then, that inhibits him in fulfilling the task set him by his father's ghost? The answer, once again, is that it is the peculiar nature of the task. Hamlet is able to do anything – except take vengeance on the man who did away with his father and took that father's place with his mother, the man who shows him the repressed wishes of his own childhood realized. Thus the loathing which should drive him on to revenge is replaced in him with self-reproaches, with scruples of conscience, which remind him that he himself is literally no better than the sinner whom he is to punish. Here I have translated into conscious terms what was bound to remain unconscious in Hamlet's mind; and if anyone is inclined to call him a hysteric, I can only accept the fact as one that is implied by my interpretation. The distaste for sexuality expressed by Hamlet in his conversation with Ophelia fits in very well with this: the same distaste which was destined to take possession of the poet's mind more and more during the years that followed, and which reached its extreme expression in *Timon of Athens*. For it can of course only be the poet's own mind which confronts us in Hamlet. I observe in a book on Shakespeare by Georg Brandes (1896) a statement that *Hamlet* was written immediately after the death

of Shakespeare's father (in 1601), that is, under the immediate impact of his bereavement and, as we may well assume, while his childhood feelings about his father had been freshly revived. It is known, too, that
[266] Shakespeare's own son who died at an early age bore the name of 'Hamnet', which is identical to 'Hamlet'. Just as *Hamlet* deals with the relation of a son to his parents, so *Macbeth* (written at approximately the same period) is concerned with the subject of childlessness. But just as all neurotic symptoms, and, for that matter, dreams, are capable of being 'overinterpreted'[t] and indeed need to be, if they are to be fully understood, so all genuinely creative writings are the product of more than a single motive and more than a single impulse in the poet's mind, and are open to more than a single interpretation. In what I have written I have only attempted to interpret the deepest layer of impulses in the mind of the creative writer.[1]

I cannot leave the subject of typical dreams of the death of loved relatives, without adding a few more words to throw light on their significance for the theory of dreams in general. In these dreams we find the highly unusual condition realized of a dream thought formed by a repressed wish entirely eluding censorship and passing into the dream without modification. There must be special factors at work to make this event possible, and I believe that the occurrence of these dreams is facilitated by two such factors. Firstly, there is no wish that seems more remote from us than this one: 'we couldn't even *dream*' – so we believe – of wishing such a thing. For this reason the dream censorship is not armed to meet such a monstrosity, just as Solon's penal code contained no punishment for parricide. Secondly, in this case the repressed and
[267] unsuspected wish is particularly often met halfway by a residue from the previous day in the form of a *worry* about the safety of the person concerned. This worry can only make its way into the dream by availing itself of the corresponding wish; while the wish can disguise itself

1 [*Footnote added* 1919:] The above indications of a psychoanalytic explanation of *Hamlet* have since been amplified by Ernest Jones and defended against the alternative views put forward in the literature of the subject. (See Jones, 1910*a* [and, in a completer form, 1949].) – [*Added* 1930:] Incidentally, I have in the meantime ceased to believe that the author of Shakespeare's works was the man from Stratford. [See Freud, 1930*e*.] – [*Added* 1919:] Further attempts at an analysis of *Macbeth* can be found in a paper of mine [Freud, 1916*d*] and in one by Jekels (1917). – [The first part of this footnote was included in a different form in the edition of 1911 but omitted from 1914 onwards: 'The views on the problem of *Hamlet* contained in the above passage have since been confirmed and supported with fresh arguments in an extensive study by Dr Ernest Jones of Toronto (1910*a*). He has also pointed out the relation between the material in *Hamlet* and the myths of the birth of heroes discussed by Rank (1909).' – Freud further discussed *Hamlet* in a posthumously published sketch dealing with 'Psychopathic Characters on the Stage' (1942*a*), probably written in 1905 or 1906.]

behind the worry that has become active during the day. [Cf. p. 496 f. below.] We may feel inclined to think that things are simpler than this and that one merely carries on during the night and in dreams with what one has been turning over in one's mind during the day; but if so we shall be leaving dreams of the death of people of whom the dreamer is fond completely in the air and without any connection with our explanation of dreams in general, and we shall thus be clinging quite unnecessarily to a riddle which is perfectly capable of solution.

It is also instructive to consider the relation of these dreams to anxiety dreams. In the dreams we have been discussing, a repressed wish has found a means of evading censorship – and the distortion which censorship involves. The invariable concomitant is that painful feelings are experienced in the dream. In just the same way anxiety dreams only occur if the censorship has been wholly or partly overpowered; and, on the other hand, the overpowering of the censorship is facilitated if anxiety has already been produced as an immediate sensation arising from somatic sources. [Cf. above, p. 208 ff.] We can thus plainly see the purpose for which the censorship exercises its office and brings about the distortion of dreams: it does so *in order to prevent the generation of anxiety or other forms of distressing affect*.

I have spoken above [p. 222] of the egoism of children's minds, and I may now add, with a hint at a possible connection between the two facts, that dreams have the same characteristic. All of them are completely egoistic:[1] the beloved ego appears in all of them, even though it may be disguised. The wishes that are fulfilled in them are invariably the ego's wishes, and if a dream seems to have been provoked by an altruistic interest, we are only being deceived by appearances. Here are a few analyses of instances which seem to contradict this assertion.

I

A child of under four years old reported having dreamt that *he had seen a big dish with a big joint of roast meat and vegetables on it. All at once* [268] *the joint had been eaten up – whole and without being cut up. He had not seen the person who ate it*.[2]

1 [Cf. end of footnote 2, p. 240 below. See also p. 287 ff.]

2 [This dream, which was dreamt by Fliess's son Robert, is mentioned in Freud's letters to Fliess of August 8 and 20, 1899. (Freud, 1950*a*, Letters 114 and 116.)] – The appearance in dreams of things of great size and in great quantities and amounts, and of exaggeration generally, may be another childish characteristic. Children have no more ardent wish than to be big and grown up and to get as much of things as grown-up people do. They are hard to satisfy, know no such

Who can the unknown person have been whose sumptuous banquet of meat was the subject of the little boy's dream? His experiences during the dream day must enlighten us on the subject. By doctor's orders he had been put on a milk diet for the past few days. On the evening of the dream day he had been naughty, and as a punishment he had been sent to bed without his supper. He had been through this hunger cure once before and had been very brave about it. He knew he would get nothing, but would not allow himself to show by so much as a single word that he was hungry. Education had already begun to have an effect on him: it found expression in this dream, which exhibits the beginning of dream distortion. There can be no doubt that the person whose wishes were aimed at this lavish meal – a meat meal, too – was himself. But since he knew he was not allowed it, he did not venture to sit down to the meal himself, as hungry children do in dreams. (Cf. my little daughter Anna's dream of strawberries on p. 116.) The person who ate the meal remained anonymous.

II

I dreamt one night that I saw in the window of a bookshop a new volume in one of the series of monographs for connoisseurs which I am in the habit of buying – monographs on great artists, on world history, on famous cities, etc. *The new series was called 'Famous Speakers' or 'Speeches' and its first volume bore the name of Dr Lecher.*

[269] When I came to analyse this, it seemed to me improbable that I should be concerned in my dreams with the fame of Dr Lecher, the non-stop speaker of the German Nationalist obstructionists in parliament. The position was that a few days earlier I had taken on some new patients for psychological treatment, and was now obliged to talk for ten or eleven hours every day. So it was I myself who was a non-stop speaker.

III

Another time I had a dream that a man I knew on the staff of the university said to me: '*My son, the Myops.*' Then followed a dialogue made

word as 'enough' and insist insatiably on a repetition of things which they have enjoyed or whose taste they liked. It is only the civilizing influence of education that teaches them moderation and how to be content or resigned. Everyone knows that neurotics are equally inclined to be extravagant and immoderate. [Children's love of repetition was alluded to by Freud towards the end of the sixth section of Chapter VII of his book on *Jokes* (Freud, 1905*c*), *RSE*, **8**, 196 f., and again discussed in Chapter V of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 35.]

up of short remarks and rejoinders. After this, however, there was yet a third piece of dream in which I myself and my sons figured. So far as the dream's latent content was concerned, Professor M. and his son were men of straw – a mere screen for me and my eldest son. I shall have to return to this dream later, on account of another of its features. [See p. 394 ff. below.]

IV

The dream which follows is an instance of really low egoistic feelings concealed behind affectionate worry.

My friend Otto was looking ill. His face was brown and he had protruding eyes.

Otto is my family doctor, and I owe him more than I can ever hope to repay: he has watched over my children's health for many years, he has treated them successfully when they have been ill, and, in addition, whenever circumstances have given him an excuse, he has given them presents. [See p. 103 above.] He had visited us on the dream day, and my wife had remarked that he looked tired and strained. That night I had my dream, which showed him with some of the signs of Basedow's [Graves'] disease. Anyone who interprets this dream without regard for my rules will conclude that I was worried about my friend's health and that this worry was realized in the dream. This would not only contradict my assertion that dreams are wish fulfilments, but my other assertion, too, that they are accessible only to egoistic impulses. But I should be glad if anyone interpreting the dream in this way would be good enough to explain to me why my fears on Otto's behalf should have lighted on *Basedow's* disease – a diagnosis for which his actual appearance gives not the slightest ground. My analysis, on the other hand, brought up [270] the following material from an occurrence six years earlier. A small group of us, which included Professor R., were driving in pitch darkness through the forest of N., which lay some hours' drive from the place at which we were spending our summer holidays. The coachman, who was not perfectly sober, spilt us, carriage and all, over an embankment, and it was only by a piece of luck that we all escaped injury. We were obliged, however, to spend the night in a neighbouring inn, at which the news of our accident brought us a lot of sympathy. A gentleman, with unmistakable signs of Basedow's disease – incidentally, just as in the dream, only the brown discoloration of the skin of the face and the protruding eyes, but no goitre – placed himself entirely at our disposal and asked

what he could do for us. Professor R. replied in his decisive manner: 'Nothing except to lend me a nightshirt.' To which the fine gentleman rejoined: 'I'm sorry, but I can't do that', and left the room.

As I continued my analysis, it occurred to me that Basedow was the name not only of a physician but also of a famous educationalist. (In my waking state I no longer felt quite so certain about this.[1]) But my friend Otto was the person whom I had asked to watch over my children's physical education, especially at the age of puberty (hence the nightshirt), in case anything happened to me. By giving my friend Otto in the dream the symptoms of our noble helper, I was evidently saying that if anything happened to me he would do just as little for the children as Baron L. had done on that occasion in spite of his kind offers of assistance. This seems to be sufficient evidence of the egoistic lining of the dream.[2]

[271] But where was its wish fulfilment to be found? Not in my avenging myself on my friend Otto, whose fate it seems to be to be ill-treated in my dreams;[3] but in the following consideration. At the same time as I represented Otto in the dream as Baron L., I had identified myself with someone else, namely Professor R.; for just as in the anecdote R. had made a request to Baron L., so I had made a request to Otto. And that is the point. Professor R., with whom I should really not venture to compare myself in the ordinary way, resembled me in having followed an independent path outside the academic world and had only achieved his well-merited title late in life. So once again I was wanting to be a professor! Indeed, the words 'late in life' were themselves a wish fulfilment; for they implied that I should live long enough to see my boys through the age of puberty myself.[4]

1 [Though in fact it was correct. He was an eighteenth-century follower of Rousseau.]

2 [*Footnote added* 1911:] When Ernest Jones was giving a scientific lecture on the egoism of dreams before an American audience, a learned lady objected to this unscientific generalization, saying that the author of the present work could only judge of the dreams of Austrians and had no business to speak of the dreams of Americans. So far as she was concerned, she was certain that all her dreams were strictly altruistic. – [*Added* 1925:] By way of excuse for this patriotic lady, I may remark that the statement that dreams are entirely egoistic [p. 237 above] must not be misunderstood. Since anything whatever that occurs in preconscious thought can pass into a dream (whether into its actual content or into the latent dream thoughts) that possibility is equally open to altruistic impulses. In the same way, an affectionate or erotic impulse towards someone else, if it is present in the unconscious, can appear in a dream. The truth in the assertion made in the text above is thus restricted to the fact that among the unconscious instigators of a dream we very frequently find egoistic impulses which seem to have been overcome in waking life.

3 [Cf. the dream of 'Irma's injection' in Chapter II (p. 104 ff. above).]

4 [This dream is further discussed on pp. 497 and 501 below.]

[(γ) *Other Typical Dreams*]

I have no experience of my own of other kinds of typical dreams, in which the dreamer finds himself flying through the air to the accompaniment of agreeable feelings or falling with feelings of anxiety; and whatever I have to say on the subject is derived from psychoanalyses.[1] The information provided by the latter forces me to conclude that these dreams, too, reproduce impressions of childhood; they relate, that is, to games involving movement, which are extraordinarily attractive to children. There cannot be a single uncle who has not shown a child how to fly by rushing across the room with him in his outstretched arms, or who has not played at letting him fall by riding him on his knee and then suddenly stretching out his leg, or by holding him up high and then suddenly pretending to drop him. Children are delighted by such experiences and never tire of asking to have them repeated, especially if there is something about them that causes a little fright or giddiness. In after [272]
years they repeat these experiences in dreams; but in the dreams they leave out the hands which held them up, so that they float or fall unsupported. The delight taken by young children in games of this kind (as well as in swings and seesaws) is well known; and when they come to see acrobatic feats in a circus their memory of such games is revived.[2] Hysterical attacks in boys sometimes consist merely in reproductions of feats of this kind, carried out with great skill. It not uncommonly happens that these games of movement, though innocent in themselves, give rise to sexual feelings.[3] Childish 'romping' ['*Hetzen*'], if I may use a word which commonly describes all such activities, is what is being repeated in dreams of flying, falling, giddiness and so on; while the

1 [The first sentence of this paragraph appeared in the original edition (1900) but was thereafter dropped until 1925. The remainder of the paragraph, together with the next one, date from 1900, and in 1914 were transferred to Chapter VI, Section E (where they recur, on p. 351 f. below). In the 1930 edition they were included in *both* places.]

2 [*Footnote added* 1925:] Analytic research has shown us that, in addition to organ pleasure [cf. *RSE*, **14**, 110 f. and *n*. 3], there is another factor which contributes to the delight taken by children in acrobatic performances and to their repetition in hysterical attacks. This other factor is a memory image, often unconscious, of an observation of sexual intercourse, whether between human beings or animals.

3 A young medical colleague, who is quite free from any kind of nervous trouble, has given me the following information on this point: 'I know from my own experience that in my childhood I had a peculiar sensation in my genitals when I was on a swing and especially when the downward motion reached its greatest momentum. And though I cannot say I really enjoyed this sensation I must describe it as a pleasurable one.' – Patients have often told me that the first pleasurable erections that they can remember occurred in their boyhood while they were climbing about. – Psychoanalysis makes it perfectly certain that the first sexual impulses frequently have their roots in games involving romping and wrestling played during childhood. [This topic was elaborated by Freud in the last section of the second of his *Three Essays on the Theory of Sexuality* (1905*d*), ibid., **7**, 177 ff.]

pleasurable feelings attached to these experiences are transformed into anxiety. But often enough, as every mother knows, romping among children actually ends in squabbling and tears.

Thus I have good grounds for rejecting the theory that what provokes dreams of flying and falling is the state of our tactile feelings during sleep or sensations of the movement of our lungs, and so on. [Cf. p. 34 above.] In my view these sensations are themselves reproduced as part of the memory to which the dream goes back: that is to say, they are part of the *content* of the dream and not its source.

[273] I cannot, however, disguise from myself that I am unable to produce any complete explanation of this class of typical dreams.[1] My material has left me in the lurch precisely at this point. I must, however, insist upon the general assertion that all the tactile and motor sensations which occur in these typical dreams are called up immediately there is any psychical reason for making use of them and that they can be disregarded when no such need for them arises. [Cf. pp. 210–11 above.] I am also of the opinion that the relation of these dreams to infantile experiences has been established with certainty from the indications I have found in the analyses of psychoneurotics. I am not able to say, however, what other meanings may become attached to the recollection of such sensations in the course of later life – different meanings, perhaps, in every individual case, in spite of the typical appearance of the dreams; and I should be glad to be able to fill in the gap by a careful analysis of clear instances. If anyone feels surprised that, in spite of the frequency precisely of dreams of flying, falling and pulling out teeth, etc., I should be complaining of lack of material on this particular topic, I must explain that I myself have not experienced any dreams of the kind since I turned my attention to the subject of dream interpretation. The dreams of neurotics, moreover, of which I might otherwise avail myself, cannot always be interpreted – not, at least, in many cases, so as to reveal the whole of their concealed meaning; a particular psychical force, which was concerned with the original constructing of the neurosis and is brought into operation once again when attempts are made at resolving it, prevents us from interpreting such dreams down to their last secret.

1 [In the original edition (1900) the following paragraph (the first on examination dreams) *preceded* this one, and the present paragraph concluded the chapter. Thereafter this paragraph was altogether omitted until 1925.]

(δ) *Examination Dreams*

Everyone who has passed the matriculation examination at the end of his school studies complains of the obstinacy with which he is pursued by anxiety dreams of having failed, or of being obliged to take the examination again, etc. In the case of those who have obtained a university degree this typical dream is replaced with another one which represents them as having failed in their university finals; and it is in vain that they object, even while they are still asleep, that for years they have been [274]
practising medicine or working as university lecturers or heads of offices. The ineradicable memories of the punishments that we suffered for our evil deeds in childhood become active within us once more and attach themselves to the two crucial points in our studies – the '*dies irae, dies illa*' of our stiffest examinations. The 'examination anxiety' of neurotics owes its intensification to these same childhood fears. After we have ceased to be schoolchildren, our punishments are no longer inflicted on us by our parents or by those who brought us up or later by our schoolmasters. The relentless causal chains of real life take charge of our further education, and now we dream of matriculation or finals (and who has not trembled on those occasions, even if he was well prepared for the examination?) whenever, having done something wrong or failed to do something properly, we expect to be punished by the event – whenever, in short, we feel the burden of responsibility.

For a further explanation of examination dreams[1] I have to thank an experienced colleague [Stekel], who once declared at a scientific meeting that so far as he knew dreams of matriculation only occur in people who have successfully passed it and never in people who have failed in it. It would seem, then, that anxious examination dreams (which, as has been confirmed over and over again, appear when the dreamer has some responsible activity ahead of him next day and is afraid there may be a fiasco) search for some occasion in the past in which great anxiety has turned out to be unjustified and has been contradicted by the event. This, then, would be a very striking instance of the content of a dream being misunderstood by the waking agency. [See p. 216 above.] What is regarded as an indignant protest against the dream: 'But I'm a doctor, etc., already!' would in reality be the consolation put forward by the dream, and would accordingly run: 'Don't be afraid of tomorrow! Just think how anxious you were before your matriculation, and yet nothing happened to you. You're a doctor, etc., already.' And the anxiety which

1 [This paragraph and the next one were added in 1909. In the editions of 1909 and 1911 only, the words 'the true explanation' took the place of 'a further explanation'.]

is attributed to the dream would really have arisen from the day's residues.

[275] Such tests as I have been able to make of this explanation on myself and on other people, though they have not been sufficiently numerous, have confirmed its validity. For instance, I myself failed in Forensic Medicine in my finals; but I have never had to cope with this subject in dreams, whereas I have quite often been examined in botany, zoology or chemistry. I went in for the examination in these subjects with well-founded anxiety; but, whether by the grace of destiny or of the examiners, I escaped punishment. In my dreams of school examinations, I am invariably examined in history, in which I did brilliantly – though only, it is true, because [in the oral examination] my kindly master (the one-eyed benefactor of another dream, see p. 15) did not fail to notice that on the paper of questions which I handed him back I had run my fingernail through the middle one of the three questions included, to warn him not to insist upon that particular one. One of my patients, who decided not to sit for his matriculation the first time but passed it later, and who subsequently failed in his army examination and never got a commission, has told me that he often dreams of the former of these examinations but never of the latter.[1]

The interpretation of examination dreams is faced with the difficulty which I have already referred to as characteristic of the majority of typical dreams [p. 214].[2] It is but rarely that the material with which the dreamer provides us in associations is sufficient to interpret the dream. It is only by collecting a considerable number of examples of such dreams that we can arrive at a better understanding of them. Not long ago I came to the conclusion that the objection, 'You're a doctor, etc., already', does not merely conceal a consolation but also signifies a

[276] reproach. This would have run: 'You're quite old now, quite far advanced in life, and yet you go on doing these stupid, childish things.' This mixture of self-criticism and consolation would thus correspond to the latent content of examination dreams. If so, it would not be surprising

1 [At this point in the 1909 edition the following paragraph appeared: 'The colleague whom I have mentioned above (Dr Stekel) has drawn attention to the fact that the word we use for matriculation, "*Matura*", also means "maturity"; he claims to have observed that "*Matura*" dreams very often appear when a sexual test lies ahead for the next day, when, that is, the fiasco that is dreaded may lie in an insufficient release of potency.' In the 1911 edition the following sentence was added: 'A German colleague has, as I think rightly, objected to this that the name of this examination in Germany – "*Abiturium*" – does not bear this double meaning.' This whole paragraph was omitted from 1914 onwards. In 1925 it was replaced with the new final paragraph of the chapter. The subject was discussed by Stekel himself in 1909, 464 and 471.]

2 [This paragraph was added in 1914.]

if the self-reproaches for being 'stupid' and 'childish' in these last examples referred to the repetition of reprehensible sexual acts.

Wilhelm Stekel,[1] who put forward the first interpretation of dreams of matriculation ['*Matura*'], was of the opinion that they regularly related to sexual tests and sexual maturity. My experience has often confirmed his view.[2]

1 [This paragraph was added in 1925.]

2 [In the 1909 and 1911 editions this chapter was continued with a discussion of other kinds of 'typical' dreams. But from 1914 onwards this further discussion was transferred to Chapter VI, Section E, after the newly introduced material dealing with dream symbolism. See p. 344 below. (Cf. Editors' Introduction, p. xvi f. above.)]

VI

THE DREAM-WORK[1]

[277] Every attempt that has hitherto been made to solve the problem of dreams has dealt directly with their *manifest* content as it is presented in our memory. All such attempts have endeavoured to arrive at an interpretation of dreams from their manifest content or (if no interpretation was attempted) to form a judgement as to their nature on the basis of that same manifest content. We are alone in taking something else into account. We have introduced a new class of psychical material between the manifest content of dreams and the conclusions of our enquiry: namely, their *latent* content, or (as we say) the 'dream thoughts' [*Traumdenken*], arrived at by means of our procedure. It is from these dream thoughts and not from a dream's manifest content that we disentangle its meaning. We are thus presented with a new task which had no previous existence: the task, that is, of investigating the relations between the manifest content of dreams and the latent dream thoughts, and of tracing out the processes by which the latter have been changed into the former.

The dream thoughts and the dream content are presented to us like two versions of the same subject matter in two different languages. Or, more properly, the dream content seems like a transcript [*Übertragung*] of the dream thoughts into another mode of expression, whose characters and syntactic laws it is our business to discover by comparing the original and the translation [*Übersetzung*][T]. The dream thoughts are immediately comprehensible, as soon as we have learnt them. The dream content, on the other hand, is expressed as it were in a pictographic script, the characters of which have to be transposed [*übertragen*] individually into the language of the dream thoughts. If we attempted to read these characters according to their pictorial value instead of according to their symbolic relation, we should clearly be led into error. Suppose I have a picture-puzzle, a rebus, in front of me. It

1 [Lecture XI of Freud's *Introductory Lectures* (1916–17*a*) deals with the dream-work on a much less extensive scale. Cf. *RSE*, **15**, 148 ff.]

depicts a house with a boat on its roof, a single letter of the alphabet, the figure of a running man whose head has been conjured away, and so [278]
on. Now I might be misled into raising objections and declaring that the picture as a whole and its component parts are nonsensical. A boat has no business to be on the roof of a house, and a headless man cannot run. Moreover, the man is bigger than the house; and if the whole picture is intended to represent a landscape, letters of the alphabet are out of place in it since such objects do not occur in nature. But obviously we can only form a proper judgement of the rebus if we put aside criticisms such as these of the whole composition and its parts and if, instead, we try to replace each separate element with a syllable or word that can be represented by that element in some way or other. The words which are put together in this way are no longer nonsensical but may form a poetical phrase of the greatest beauty and significance. A dream is a picture-puzzle of this sort and our predecessors in the field of dream interpretation have made the mistake of treating the rebus as a pictorial composition: and as such it has seemed to them nonsensical and worthless.

(A)
THE WORK OF CONDENSATION

[279] The first thing that becomes clear to anyone who compares the dream content with the dream thoughts is that a work of *condensation* [*Verdichtung*][T] on a large scale has been carried out. Dreams are brief, meagre and laconic in comparison with the range and wealth of the dream thoughts. If a dream is written out it may perhaps fill half a page. The analysis setting out the dream thoughts underlying it may occupy six, eight or a dozen times as much space. This relation varies with different dreams; but so far as my experience goes its direction never varies. As a rule one underestimates the amount of compression that has taken place, since one is inclined to regard the dream thoughts that have been brought to light as the complete material, whereas if the work of interpretation is carried further it may reveal still more thoughts concealed behind the dream. I have already had occasion to point out [cf. p. 193 f. above] that it is in fact never possible to be sure that a dream has been completely interpreted.[1] Even if the solution seems satisfactory and without gaps, the possibility always remains that the dream may have yet another meaning. Strictly speaking, then, it is impossible to determine the amount of condensation.

There is an answer, which at first sight seems most plausible, to the argument that the great lack of proportion between the dream content and the dream thoughts implies that the psychical material has undergone an extensive process of condensation in the course of the formation of the dream. We very often have an impression that we have dreamt a great deal all through the night and have since forgotten most of what we dreamt. On this view, the dream which we remember when we wake up would only be a fragmentary remnant of the total dream-work; and this, if we could recollect it in its entirety, might well be as extensive as the dream thoughts. There is undoubtedly some truth in this: there can be no question that dreams can be reproduced most accurately if we try to recall them as soon as we wake up and that our memory of them
[280] becomes more and more incomplete towards evening. But on the other hand it can be shown that the impression that we have dreamt a great deal more than we can reproduce is very often based on an illusion, the origin of which I shall discuss later. [Cf. pp. 438 and 462 f.] Moreover, the

1 [This subject is discussed at length in Freud (1925*i*), Section A; *RSE*, **19**, 115 ff.]

hypothesis that condensation occurs during the dream-work is not affected by the possibility of dreams being forgotten, since this hypothesis is proved to be correct by the quantities of ideas which are related to each individual piece of the dream which has been retained. Even supposing that a large piece of the dream has escaped recollection, this may merely have prevented our having access to another group of dream thoughts. There is no justification for supposing that the lost pieces of the dream would have related to the same thoughts which we have already reached from the pieces of the dream that have survived.[1]

In view of the very great number of associations [*Einfällen*] produced in analysis to each individual element of the content of a dream, some readers may be led to doubt whether, as a matter of principle, we are justified in regarding as part of the dream thoughts all the associations that occur to us during the subsequent [*nachträglich*] analysis – whether we are justified, that is, in supposing that all these thoughts were already active during the state of sleep and played a part in the formation of the dream [*Traumbildung*]. Is it not more probable that new trains of thought have arisen in the course of the analysis which had no share in forming the dream? I can only give limited assent to this argument. It is no doubt true that some trains of thought arise for the first time during the analysis. But one can convince oneself in all such cases that these new connections are only set up between thoughts which were already linked in some other way in the dream thoughts.[2] The new connections are, as it were, loop-lines or short-circuits, made possible by the existence of other and deeper-lying connecting paths. It must be allowed that the great bulk of the thoughts which are revealed in analysis were already active during the process of forming the dream; for, after working through a string of [281]
thoughts which seem to have no connection with the formation of a dream, one suddenly comes upon one which is represented in its content and is indispensable for its interpretation, but which could not have been reached except by this particular line of approach. I may here recall the dream of the botanical monograph [p. 149 ff. above], which strikes one as the product of an astonishing amount of condensation, even though I have not reported its analysis in full.

How, then, are we to picture psychical conditions during the period of sleep which precedes dreams? Are all the dream thoughts present

1 [*Footnote added* 1914:] The occurrence of condensation in dreams has been hinted at by many writers. Du Prel (1885, 85) has a passage in which he says it is absolutely certain that there has been a process of condensation of the groups of ideas in dreams.

2 [This question is mentioned again on p. 277 below and discussed at very much greater length in the last part of Section A of Chapter VII (p. 471 ff.). See especially p. 475.]

alongside one another? or do they occur in sequence? or do a number of trains of thought start out simultaneously from different centres and afterwards unite? There is no need for the present, in my opinion, to form any plastic idea of psychical conditions during the formation of dreams. It must not be forgotten, however, that we are dealing with an *unconscious* process of thought, which may easily be different from what we perceive during purposive reflection accompanied by consciousness.

The unquestionable fact remains, however, that the formation of dreams is based on a process of condensation. How is that condensation brought about?

When we reflect that only a small minority of all the dream thoughts revealed are represented in the dream by one of their ideational elements, we might conclude that condensation is brought about by *omission*: that is, that the dream is not a faithful translation or a point-for-point projection of the dream thoughts, but a highly incomplete and fragmentary version of them. This view, as we shall soon discover, is a most inadequate one. But we may take it as a provisional starting point and go on to a further question. If only a few elements from the dream thoughts find their way into the dream content, what are the conditions which determine their selection?

In order to get some light on this question we must turn our attention to those elements of the dream content which must have fulfilled these conditions. And the most favourable material for such an investigation will be a dream to the construction of which a particularly intense process of condensation has contributed. I shall accordingly begin by choosing for the purpose the dream which I have already recorded on p. 149 ff.

I. THE DREAM OF THE BOTANICAL MONOGRAPH

[282] CONTENT OF THE DREAM. – *I had written a monograph on an (unspecified) genus of plants. The book lay before me and I was at the moment turning over a folded coloured plate. Bound up in the copy there was a dried specimen of the plant.*

The element in this dream which stood out most was the *botanical monograph*. This arose from the impressions of the dream day: I had in fact seen a monograph on the genus Cyclamen in the window of a bookshop. There was no mention of this genus in the content of the dream;

all that was left in it was the monograph and its relation to botany. The 'botanical monograph' immediately revealed its connection with the *work upon cocaine* which I had once written. From 'cocaine' the chains of thought led on the one hand to the *Festschrift* and to certain events in a university laboratory, and on the other hand to my friend Dr Königstein, the eye surgeon, who had had a share in the introduction of cocaine. The figure of Dr Königstein further reminded me of the interrupted conversation which I had had with him the evening before and of my various reflections upon the payment for medical services among colleagues. This conversation was the actual currently active instigator of the dream; the monograph on the Cyclamen was also a currently active impression, but one of an indifferent nature. As I perceived, the 'botanical monograph' in the dream turned out to be an 'intermediate common entity' between the two experiences of the previous day: it was taken over unaltered from the indifferent impression and was linked with the psychically significant event by copious associative connections.

Not only the compound idea, 'botanical monograph', however, but each of its components, 'botanical' and 'monograph' separately, led by numerous connecting paths deeper and deeper into the tangle of dream thoughts. 'Botanical' was related to the figure of Professor *Gärtner* [Gardener], the *blooming* looks of his wife, to my patient *Flora* and to the lady [Frau L.] of whom I had told the story of the forgotten *flowers*. Gärtner led in turn to the laboratory and to my conversation with Königstein. My two patients [Flora and Frau L.] had been mentioned in the course of this conversation. A train of thought joined the lady with the flowers to my wife's *favourite flowers* and thence to the title of the [283]
monograph which I had seen for a moment during the day. In addition to these, 'botanical' recalled an episode at my secondary school and an examination while I was at the university. A fresh topic touched upon in my conversation with Dr Königstein – my *favourite* hobbies – was joined, through the intermediate link of what I jokingly called my *favourite flower*, the artichoke, with the train of thought proceeding from the forgotten flowers. Behind 'artichokes' lay, on the one hand, my thoughts about Italy[1] and, on the other hand, a scene from my childhood which was the opening of what have since become my intimate relations with books. Thus 'botanical' was a regular nodal point in the dream. Numerous trains of thought converged upon it, which, as I can guarantee, had appropriately entered into the context of the conversation with

1 [This seems to be a reference to an element in the dream thoughts not previously mentioned.]

Dr Königstein. Here we find ourselves in a factory of thoughts where, as in the 'weaver's masterpiece',

> Ein Tritt tausend Fäden regt,
> Die Schifflein herüber hinüber schiessen,
> Die Fäden ungesehen fliessen,
> Ein Schlag tausend Verbindungen schlägt.[1]

So, too, 'monograph' in the dream touches upon two subjects: the one-sidedness of my studies and the costliness of my favourite hobbies.

This first investigation leads us to conclude that the elements 'botanical' and 'monograph' found their way into the content of the dream because they possessed copious contacts with the majority of the dream thoughts, because, that is to say, they constituted 'nodal points' upon which a great number of the dream thoughts converged, and because they had several meanings in connection with the interpretation of the dream. The explanation of this fundamental fact can also be put in another way: each of the elements of the dream's content turns out to have been 'overdetermined' [*überdeterminiert*] – to have been represented in the dream thoughts many times over.

[284] We discover still more when we come to examine the remaining constituents of the dream in relation to their appearance in the dream thoughts. The *coloured plate* which I was unfolding led (see the analysis, p. 152 ff.) to a new topic, my colleagues' criticisms of my activities, and to one which was already represented in the dream, my favourite hobbies; and it led, in addition, to the childhood memory in which I was pulling to pieces a book with coloured plates. The *dried specimen of the plant* touched upon the episode of the herbarium at my secondary school and specially stressed that memory.

The nature of the relation between dream content and dream thoughts thus becomes visible. Not only are the elements of a dream determined by the dream thoughts many times over, but the individual dream thoughts are represented in the dream by several elements. Associative paths lead from one element of the dream to several dream thoughts, and from one dream thought to several elements of the dream. Thus a dream is not constructed by each individual dream thought, or group of dream thoughts, finding (in abbreviated form)

1 [. . . a thousand threads one treadle throws,
Where fly the shuttles hither and thither,
Unseen the threads are knit together,
And an infinite combination grows.
Goethe, *Faust*, Part I [Scene 4] (Bayard Taylor's translation).]

separate representation in the content of the dream – in the kind of way in which an electorate chooses parliamentary representatives; a dream is constructed, rather, by the whole mass of dream thoughts being submitted to a sort of manipulative process in which those elements which have the most numerous and strongest supports acquire the right of entry into the dream content – in a manner analogous to election by *scrutin de liste*. In the case of every dream which I have submitted to an analysis of this kind I have invariably found these same fundamental principles confirmed: the elements of the dream are constructed out of the whole mass of dream thoughts and each one of those elements is shown to have been determined many times over in relation to the dream thoughts.

It will certainly not be out of place to illustrate the connection between dream content and dream thoughts by a further example, which is distinguished by the specially ingenious interweaving of their reciprocal relations. It is a dream produced by one of my patients – a man whom I was treating for claustrophobia. It will soon become clear why I have chosen to give this exceptionally clever dream production the title of

II. 'A LOVELY DREAM'

He was driving with a large party to X Street, in which there was an unpretentious inn. (This is not the case.) *There was a play being acted inside it. At one moment he was audience, at another actor. When it was over, they had to change their clothes so as to get back to town. Some of the company were shown into rooms on the ground floor and others into rooms on the first floor. Then a dispute broke out. The ones up above were angry because the ones down below were not ready, and they could not come downstairs. His brother was up above and he was down below and he was angry with his brother because they were so much pressed.* (This part was obscure.) *Moreover, it had been decided and arranged even when they first arrived who was to be up above and who was to be down below. Then he was walking by himself up the rise made by X Street in the direction of town. He walked with such difficulty and so laboriously that he seemed glued to the spot. An elderly gentleman came up to him and began abusing the King of Italy. At the top of the rise he was able to walk much more easily.* [285]

His difficulty in walking up the rise was so distinct that after waking up he was for some time in doubt whether it was a dream or reality.

We should not think very highly of this dream, judging by its manifest content. In defiance of the rules, I shall begin its interpretation with the portion which the dreamer described as being the most distinct.

The difficulty which he dreamt of and probably actually experienced during the dream – the laborious climbing up the rise accompanied by dyspnoea – was one of the symptoms which the patient had in fact exhibited years before and which had at that time been attributed, along with certain other symptoms, to tuberculosis. (The probability is that this was hysterically simulated.) The peculiar sensation of inhibited movement that occurs in this dream is already familiar to us from dreams of exhibiting [see p. 215 ff. above] and we see once more that it is material available at any time for any other representational purpose. [Cf. p. 299 ff.] The piece of the dream content which described how the climb began by being difficult and became easy at the end of the rise reminded me, when I heard it, of the masterly introduction to Alphonse Daudet's *Sappho*. That well-known passage describes how a young man carries his mistress
[286] upstairs in his arms; at first she is as light as a feather, but the higher he climbs the heavier grows her weight. The whole scene foreshadows the course of their love affair, which was intended by Daudet as a warning to young men not to allow their affections to be seriously engaged by girls of humble origin and a dubious past.[1] Though I knew that my patient had been involved in a love affair which he had recently broken off with a lady on the stage, I did not expect to find my guess at an interpretation justified. Moreover, the situation in *Sappho* was the *reverse* of what it had been in the dream. In the dream the climbing had been difficult to begin with and had afterwards become easy; whereas the symbolism in the novel only made sense if something that had been begun lightly ended by becoming a heavy burden. But to my astonishment my patient replied that my interpretation fitted in very well with a piece he had seen at the theatre the evening before. It was called *Rund um Wien* [*Round Vienna*] and gave a picture of the career of a girl who began by being respectable, who then became a *demi-mondaine* and had liaisons with men in high positions and so '*went up in the world*', but who ended by '*coming down in the world*'. The piece had, moreover, reminded him of another, which he had seen some years earlier, called *Von Stufe zu Stufe* [*Step by Step*], and which had been advertised by a poster showing a staircase with a flight of *steps*.

1 [*Footnote added* 1911:] What I have written below in the section on symbolism about the significance of dreams of climbing [p. 317 *n.* 2] throws light upon the imagery chosen by the novelist.

To continue with the interpretation. The actress with whom he had had this latest, eventful liaison had lived in X Street. There is nothing in the nature of an inn in that street. But when he was spending part of the summer in Vienna on the lady's account he had put up [German '*abgestiegen*', literally '*stepped down*'] at a small hotel in the neighbourhood. When he left the hotel he had said to his cab driver: 'Anyhow I'm lucky not to have picked up any vermin.' (This, incidentally, was another of his phobias.) To this the driver had replied: 'How could anyone put up at such a place! It's not a hotel, it's only an *inn*.'

The idea of an inn at once recalled a quotation to his mind:

> Bei einem *Wirte* wundermild,
> Da war ich jüngst zu Gaste.[1]

The host in Uhland's poem was an *apple tree*; and a second quotation [287]
now carried on his train of thought:

FAUST (*mit der Jungen tanzend*):
> Einst hatt' ich *einen schönen Traum*;
> Da sah ich einen *Apfelbaum*,
> Zwei schöne Äpfel glänzten dran,
> Sie reizten mich, *ich stieg hinan*.

DIE SCHÖNE:
> Der Äpfelchen begehrt ihr sehr,
> Und schon vom Paradiese her.
> Von Freuden fühl' ich mich bewegt,
> Dass auch mein Garten solche trägt.[2]

1 [Literally 'I was lately a guest at an *inn* with a most gentle host.' (Uhland, *Wanderlieder*, 8, 'Einkehr'.)]

2 [FAUST (*dancing with the Young Witch*):
> *A lovely dream* once came to me,
> And I beheld an *apple tree*,
> On which two lovely apples shone;
> They charmed me so, *I climbed thereon*.

THE LOVELY WITCH:
> Apples have been desired by you,
> Since first in Paradise they grew;
> And I am moved with joy to know
> That such within my garden grow.

Goethe, *Faust*, Part I [Scene 21, Walpurgisnacht] (Bayard Taylor's translation, slightly modified).]

There cannot be the faintest doubt what the apple tree and the apples stood for. Moreover, lovely breasts had been among the charms which had attracted the dreamer to his actress.

The context of the analysis gave us every ground for supposing that the dream went back to an impression in childhood. If so, it must have referred to the wet-nurse of the dreamer, who was by now a man almost thirty years old. For an infant the breasts of his wet-nurse are nothing more nor less than an inn. The wet-nurse, as well as Daudet's Sappho, seem to have been allusions to the mistress whom the patient had recently dropped.

The patient's (elder) brother also appeared in the content of the dream, the brother being *up above* and the patient himself *down below*. This was once again the *reverse* of the actual situation; for, as I knew, the brother had lost his social position while the patient had maintained his. In repeating the content of the dream to me, the dreamer had avoided saying that his brother was up above and he himself 'on the ground
[288] floor'. That would have put the position too clearly, since here in Vienna if we say someone is '*on the ground floor*' we mean that he has lost his money and his position – in other words, that he has '*come down in the world*'. Now there must have been a reason for some of this part of the dream being represented by its *reverse*. Further, the reversal must hold good of some other relation between dream thoughts and dream content as well [cf. below, p. 290 f.]; and we have a hint of where to look for this reversal. It must evidently be at the end of the dream, where once again there was a *reversal* of the difficulty in going upstairs as described in *Sappho*. We can then easily see what reversal is intended. In *Sappho* the man carried a woman who was in a sexual relation to him; in the dream thoughts the position was *reversed*, and a woman was carrying a man. And since this can only happen in childhood, the reference was once more to the wet-nurse bearing the weight of the infant in her arms. Thus the end of the dream made a simultaneous reference to Sappho and to the wet-nurse.

Just as the author of the novel, in choosing the name 'Sappho', had in mind an allusion to lesbian practices, so too the pieces of the dream that spoke of people '*up above*' and '*down below*' alluded to phantasies of a sexual nature which occupied the patient's mind and, as suppressed desires, were not without a bearing on his neurosis. (The interpretation of the dream did not itself show us that what were thus represented in the dream were phantasies and not recollections of real events; an analysis only gives us the *content* of a thought and leaves it to us to determine

its reality. Real and imaginary events appear in dreams at first sight as of equal validity; and that is so not only in dreams but in the production of more important psychical structures.)[1]

A 'large party' meant, as we already know [see p. 218 above], a secret. His brother was simply the representative (introduced into the childhood scene by a 'retrospective phantasy' [*zurückphantasieren*])[2] of all his later rivals for a woman's affection. The episode of the gentleman who abused the King of Italy related once again, via the medium of a recent and in itself indifferent experience, to people of lower rank pushing their [289] way into higher society. It was just as though the child at the breast was being given a warning parallel to the one which Daudet had given to young men.[3]

To provide a third opportunity for studying condensation in the formation of dreams, I will give part of the analysis of another dream, which I owe to an elderly lady undergoing psychoanalytic treatment. As was to be expected from the severe anxiety states from which the patient suffered, her dreams contained a very large number of sexual thoughts, the first realization of which both surprised and alarmed her. Since I shall not be able to pursue the interpretation of the dream to the end, its material will appear to fall into several groups without any visible connection.

III. 'THE MAY-BEETLE[4] DREAM'

CONTENT OF THE DREAM. – *She called to mind that she had two may-beetles in a box and that she must set them free or they would suffocate. She opened the box and the may-beetles were in an exhausted state. One of them flew out of the open window; but the other was*

1 [Freud is probably referring here to the discovery which he had recently made that the infantile sexual traumas apparently revealed in his analyses of neurotic patients were in fact very often phantasies. See Freud (1906*a*), *RSE*, 7, 283–4.]

2 [Phantasies of this kind had been discussed by Freud previously, in the latter part of his paper on 'Screen Memories' (1899*a*), ibid., **3**, 311 f.]

3 The imaginary nature of the situation relating to the dreamer's wet-nurse was proved by the objectively established fact that in his case the wet-nurse had been his mother. I may recall in this connection the anecdote, which I repeated on p. 181, of the young man who regretted that he had not made better use of his opportunities with his wet-nurse. A regret of the same kind was no doubt the source of the present dream.

4 [The commoner English equivalent for the German '*Maikäfer*' is 'cockchafer'. For the purposes of this dream, however, a literal translation is to be preferred.]

crushed by the casement while she was shutting it at someone's request. (Signs of disgust.)

ANALYSIS. – Her husband was temporarily away from home, and her fourteen-year-old daughter was sleeping in the bed beside her. The evening before, the girl had drawn her attention to a moth which had fallen into her tumbler of water; but she had not taken it out and felt sorry for the poor creature next morning. The book she had been reading during the evening had told how some boys had thrown a cat into boiling water, and had described the animal's convulsions. These were
[290] the two precipitating causes of the dream – in themselves indifferent. She then pursued the subject of *cruelty to animals* further. Some years before, while they were spending the summer at a particular place, her daughter had been very cruel to animals. She was collecting butterflies and asked the patient for some *arsenic* to kill them with. On one occasion a moth with a pin through its body had gone on flying about the room for a long time; another time some caterpillars which the child was keeping to turn into chrysalises starved to death. At a still more tender age the same child used to tear the wings off *beetles* and butterflies. But today she would be horrified at all these cruel actions – she had grown so kindhearted.

The patient reflected over this contradiction. It reminded her of another contradiction, between *appearance* and character, as George Eliot displays it in *Adam Bede*: one girl who was pretty, but vain and stupid, and another who was ugly, but of high character; a *nobleman* who seduced the silly girl, and a working man who felt and acted with true nobility. How impossible it was, she remarked, to recognize that sort of thing in people! Who would have guessed, to look at *her*, that she was tormented by sensual desires?

In the same year in which the little girl had begun collecting butterflies, the district they were in had suffered from a serious plague of *may-beetles*. The children were furious with the beetles and *crushed* them unmercifully. At that time my patient had seen a man who tore the wings off may-beetles and then ate their bodies. She herself had been born in *May* and had been married in *May*. Three days after her marriage she had written to her parents at home saying how happy she was. But it had been far from true.

The evening before the dream she had been rummaging among some old letters and had read some of them – some serious and some comic – aloud to her children. There had been a most amusing letter from a piano teacher who had courted her when she was a girl, and another from an admirer of *noble birth*.[1]

1 This had been the true instigator of the dream.

She blamed herself because one of her daughters had got hold of a 'bad' book by Maupassant.[1] The *arsenic* that the girl had asked for [291]
reminded her of the *arsenic pills* which restored the Duc de Mora's youthful strength in [Daudet's] *Le Nabab*.

'Set them free' made her think of a passage in the *Magic Flute*:

> Zur Liebe kann ich dich nicht zwingen,
> Doch geb ich dir *die Freiheit* nicht.[2]

'May-beetles' also made her think of Kätchen's words:

> Verliebt ja wie ein *Käfer* bist du mir.[3]

And in the middle of all this came a quotation from *Tannhäuser*:

> Weil du von *böser Lust* beseelt . . .[4]

She was living in a perpetual worry about her absent husband. Her fear that something might happen to him on his journey was expressed in numerous waking phantasies. A short time before, in the course of her analysis, she had lighted among her unconscious thoughts upon a complaint about her husband 'growing senile'. The wishful thought concealed by her present dream will perhaps best be conjectured if I mention that, some days before she dreamt it, she was horrified, in the middle of her daily affairs, by a phrase in the imperative mood which came into her head and was aimed at her husband: 'Go and hang yourself!' It turned out that a few hours earlier she had read somewhere or other that when a man is hanged he gets a powerful erection. The wish for an erection was what had emerged from repression in this horrifying disguise. 'Go and hang yourself!' was equivalent to: 'Get yourself an erection at any price!' Dr Jenkins's arsenic pills in *Le Nabab* fitted in here. But my patient was also aware that the most powerful aphrodisiac, cantharides

1 An interpolation is required at this point: 'books of that kind are *poison* to a girl'. The patient herself had dipped into forbidden books a great deal when she was young.

2 [Fear not, to love I'll ne'er compel thee;
Yet 'tis too soon to *set thee free*.
(Sarastro to Pamina in the Finale to Act I. – E. J. Dent's translation.)]

3 ['You are madly in love with me.' Literally 'You are in love with me like a *beetle*.' From Kleist's *Kätchen von Heilbronn*, Act IV, Sc. 2.] – A further train of thought led to the same poet's *Penthesilea*, and to the idea of *cruelty* to a lover.

4 [Literally 'Because thou wast inspired by such *evil pleasure*.' This is presumably a recollection of the opening phrase of the Pope's condemnation reported by Tannhäuser in the last scene of the opera. The actual words are: 'Hast du so böse Lust getheilt' – 'Since thou hast shared such evil pleasure'.]

[292] (commonly known as 'Spanish flies'), was prepared from *crushed beetles*. This was the drift of the principal part of the dream's content.

The opening and shutting of *windows* was one of the main subjects of dispute between her and her husband. She herself was aerophilic in her sleeping habits; her husband was aerophobic. *Exhaustion* was the chief symptom which she complained of at the time of the dream.

In all three of the dreams which I have just recorded, I have indicated by italics the points at which one of the elements of the dream content reappears in the dream thoughts, so as to show clearly the multiplicity of connections arising from the former. Since, however, the analysis of none of these dreams has been traced to its end, it will perhaps be worthwhile to consider a dream whose analysis has been recorded exhaustively, so as to show how its content is overdetermined. For this purpose I will take the dream of Irma's injection [p. 94 ff. above]. It will be easy to see from that example that the work of condensation makes use of more than one method in the construction of dreams.

The principal figure in the dream content was my patient Irma. She appeared with the features which were hers in real life, and thus, in the first instance, represented herself. But the position in which I examined her by the window was derived from someone else, the lady for whom, as the dream thoughts showed, I wanted to exchange my patient. Insofar as Irma appeared to have a diphtheritic membrane, which recalled my anxiety about my eldest daughter, she stood for that child and, behind her, through her possession of the same name as my daughter, was hidden the figure of my patient who succumbed to poisoning. In the further course of the dream the figure of Irma acquired still other meanings, without any alteration occurring in the visual picture of her in the dream. She turned into one of the children whom we had examined in the neurological department of the children's hospital, where my two friends revealed their contrasting characters. The figure of my own child was evidently the stepping-stone towards this transition. The same 'Irma's' recalcitrance over opening her mouth brought an allusion to another lady whom I had once examined, and, through the same connection, to my wife. Moreover, the pathological changes which I discovered in her throat involved allusions to a whole series of other figures.

[293] None of these figures whom I lighted upon by following up 'Irma' appeared in the dream in bodily shape. They were concealed behind the dream figure of 'Irma', which was thus turned into a collective

image with, it must be admitted, a number of contradictory characteristics. Irma became the representative of all these other figures which had been sacrificed to the work of condensation, since I passed over to *her*, point by point, everything that reminded me of *them*.

There is another way in which a 'collective figure' can be produced for purposes of dream condensation, namely by uniting the actual features of two or more people into a single dream image. It was in this way that the Dr M. of my dream was constructed. He bore the name of Dr M., he spoke and acted like him; but his physical characteristics and his malady belonged to someone else, namely to my eldest brother. One single feature, his pale appearance, was doubly determined, since it was common to both of them in real life.

Dr R. in my dream about my uncle with the yellow beard [p. 122 ff. above] was a similar composite figure. But in his case the dream image was constructed in yet another way. I did not combine the features of one person with those of another and in the process omit from the memory picture certain features of each of them. What I did was to adopt the procedure by means of which Galton produced family portraits: namely by projecting two images on to a single plate, so that certain features common to both are emphasized, while those which fail to fit in with one another cancel one another out and are indistinct in the picture. In my dream about my uncle the fair beard emerged prominently from a face which belonged to two people and which was consequently blurred; incidentally, the beard further involved an allusion to my father and myself through the intermediate idea of growing grey.

The construction of collective and composite figures is one of the chief methods by which condensation operates in dreams. I shall presently have occasion to deal with them in another context. [See p. 285 ff. below.]

The occurrence of the idea of 'dysentery' in the dream of Irma's injection also had a multiple determination: first owing to its phonetic similarity to 'diphtheria' [see p. 102 above], and secondly owing to its connection with the patient whom I had sent to the East and whose hysteria was not recognized.

Another interesting example of condensation in this dream was the [294]
mention in it of 'propyls' [p. 103 ff.]. What was contained in the dream thoughts was not 'propyls' but 'amyls'. It might be supposed that a single displacement [*Verschiebung*] had taken place at this point in the construction of the dream. This was indeed the case. But the displacement served the purposes of condensation, as is proved by the following

addition to the analysis of the dream. When I allowed my attention to dwell for a moment longer on the word 'propyls', it occurred to me that it sounded like 'Propylaea'.[1] But there are Propylaea not only in Athens but in Munich.[2] A year before the dream I had gone to Munich to visit a friend who was seriously ill at the time – the same friend who was unmistakably alluded to in the dream by the word 'trimethylamine' which occurred immediately after 'propyls'.

I shall pass over the striking way in which here, as elsewhere in dream analyses, associations of the most various inherent importance are used for laying down thought connections as though they were of equal weight, and shall yield to the temptation to give, as it were, a plastic picture of the process by which the amyls in the dream thoughts were replaced with propyls in the dream content.

On the one hand, we see the group of ideas attached to my friend Otto, who did not understand me, who sided against me, and who made me a present of liqueur with an aroma of amyl. On the other hand, we see – linked to the former group by its very contrast – the group of ideas attached to my friend in Berlin [Wilhelm Fliess], who *did* understand me, who would take my side, and to whom I owed so much valuable information, dealing, among other things, with the chemistry of the sexual processes.

The recent exciting causes – the actual instigators of the dream – determined what was to attract my attention in the 'Otto' group; the amyl was among these selected elements, which were predestined to form part of the dream content. The copious 'Wilhelm' group was stirred up precisely through being in contrast to 'Otto', and those elements in it were emphasized which echoed those which were already stirred up in 'Otto'. All through the dream, indeed, I kept on turning from someone who annoyed me to someone else who could be agreeably contrasted with him; point by point, I called up a friend against an
[295] opponent. Thus the amyl in the 'Otto' group produced memories from the field of chemistry in the other group; in this manner the trimethylamine, which was supported from several directions, found its way into the dream content. 'Amyls' itself might have entered the dream content unmodified; but it came under the influence of the 'Wilhelm' group. For the whole range of memories covered by that name was searched through in order to find some element which could provide a two-sided determination for 'amyls'. 'Propyls' was closely associated with 'amyls', and Munich from the 'Wilhelm' group with its 'propylaea' came

1 [*Propylen* and *Propylaën* in German.]

2 [A ceremonial portico on the model of the Athenian one.]

halfway to meet it. The two groups of ideas converged in 'propyls-propylaea'; and, as though by an act of compromise, this intermediate element was what found its way into the dream content. Here an intermediate common entity had been constructed which admitted of multiple determination. It is obvious, therefore, that multiple determination must make it easier for an element to force its way into the dream content. In order to construct an intermediate link of this kind, attention is without hesitation displaced from what is actually intended on to some neighbouring association.

Our study of the dream of Irma's injection has already enabled us to gain some insight into the processes of condensation during the formation of dreams. We have been able to observe certain of their details, such as how preference is given to elements that occur several times over in the dream thoughts, how new unities are formed (in the shape of collective figures and composite structures), and how intermediate common entities are constructed. The further questions of the *purpose* of condensation and of the factors which tend to produce it will not be raised till we come to consider the whole question of the psychical processes at work in the formation of dreams. [See p. 294 and Chapter VII, Section E, especially p. 532 ff. below.] We will be content for the present with recognizing the fact that dream condensation is a notable characteristic of the relation between dream thoughts and dream content.

The work of condensation in dreams is seen at its clearest when it handles words and names. It is true in general that words are frequently treated in dreams as though they were things, and for that reason they are apt to be combined in just the same way as are presentations of things.[1] Dreams [296] of this sort offer the most amusing and curious neologisms.[2]

I

On one occasion a medical colleague had sent me a paper he had written, in which the importance of a recent physiological discovery was, in my opinion, overestimated, and in which, above all, the subject was treated in too emotional a manner. The next night I dreamt a sentence

1 [The relation between presentations of words and of things was discussed by Freud very much later, in the last pages of his paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 177–80.]

2 [A dream involving a number of verbal conceits is reported by Freud in Chapter V (10) of his *Psychopathology of Everyday Life* (1901*b*), ibid., **6**, 56–8. – The examples which follow are, as will be seen, for the most part untranslatable. See Editors' Introduction (p. xxv above).]

which clearly referred to this paper: '*It's written in a positively norekdal style*.' The analysis of the word caused me some difficulty at first. There could be no doubt that it was a parody of the [German] superlatives '*kolossal*' and '*pyramidal*'; but its origin was not so easy to guess. At last I saw that the monstrosity was composed of the two names 'Nora' and 'Ekdal' – characters in two well-known plays of Ibsen's. [*A Doll's House* and *The Wild Duck*.] Some time before, I had read a newspaper article on Ibsen by the same author whose latest work I was criticizing in the dream.

II

One of my women patients told me a short dream which ended in a meaningless verbal compound. She dreamt she was with her husband at a peasant festivity and said: '*This will end in a general "Maistollmütz"*.' In the dream she had a vague feeling that it was some kind of pudding made with maize – a sort of polenta. Analysis divided the word into '*Mais*' ['maize'], '*toll*' ['mad'], '*mannstoll*' ['nymphomaniac' – literally 'mad for men'] and *Olmütz* [a town in Moravia]. All these fragments were found to be remnants of a conversation she had had at table with her relatives. The following words lay behind '*Mais*' (in addition to a reference to the recently opened Jubilee Exhibition[1]): '*Meissen*' (a Meissen [Dresden] porcelain figure representing a bird); '*Miss*' (her
[297] relatives' English governess had just gone to *Olmütz*); and '*mies*' (a Jewish slang term, used jokingly to mean 'disgusting'). A long chain of thoughts and associations led off from each syllable of this verbal hotch-potch.

III

A young man, whose doorbell had been rung late one night by an acquaintance who wanted to leave a visiting card on him, had a dream that night: *A man had been working till late in the evening to put his house telephone in order. After he had gone, it kept on ringing – not continuously, but with detached rings. His servant fetched the man back, and the latter remarked: 'It's a funny thing that even people who are "tutelrein" as a rule are quite unable to deal with a thing like this*.'

It will be seen that the indifferent exciting cause of the dream only covers one element of it. That episode only obtained any importance

1 [To commemorate the jubilee of the Emperor Franz Joseph, which was celebrated in 1898.]

from the fact that the dreamer put it in the same series as an earlier experience which, though equally indifferent in itself, was given a substitutive meaning by his imagination. When he was a boy, living with his father, he had upset a glass of water over the floor while he was half-asleep. The flex of the house telephone had been soaked through and its *continuous ringing* had disturbed his father's sleep. Since the continuous ringing corresponded to getting wet, the '*detached rings*' were used to represent drops falling. The word '*tutelrein*' could be analysed in three directions, and led in that way to three of the subjects represented in the dream thoughts. '*Tutel*' is a legal term for 'guardianship' ['tutelage']. '*Tutel*' (or possibly '*Tuttel*') is also a vulgar term for a woman's breast. The remaining portion of the word, '*rein*' ['clean'], combined with the first part of '*Zimmertelegraph*' ['house telephone'], forms '*zimmerrein*' ['house-trained'] – which is closely connected with making the floor wet, and, in addition, sounded very much like the name of a member of the dreamer's family.[1]

IV

In a confused dream of my own of some length, whose central point seemed to be a sea voyage, it appeared that the next stopping place was called '*Hearsing*' and the next after that '*Fliess*'. This last word was the name of my friend in B[erlin], who has often been the goal of my travels. 'Hearsing' was a compound. One part of it was derived from the names of places on the suburban railway near Vienna, which so often end in 'ing': Hietzing, Liesing, Mödling (Medelitz, '*meae deliciae*', was its old [298]

1 In waking life this same kind of analysis and synthesis of syllables – a syllabic chemistry, in fact – plays a part in a great number of jokes: 'What is the cheapest way of obtaining silver? You go down an avenue of silver poplars [*Pappeln*, which means both "poplars" and "babbling"] and call for silence. The babbling then ceases and the silver is released.' The first reader and critic of this book – and his successors are likely to follow his example – protested that 'the dreamer seems to be too ingenious and amusing'. This is quite true so long as it refers only to the dreamer; it would only be an objection if it were to be extended to the dream interpreter. In waking reality I have little claim to be regarded as a wit. If my dreams seem amusing, that is not on my account, but on account of the peculiar psychological conditions under which dreams are constructed; and the fact is intimately connected with the theory of jokes and the comic. Dreams become ingenious and amusing because the direct and easiest pathway to the expression of their thoughts is barred: they are forced into being so. The reader can convince himself that my patients' dreams seem at least as full of jokes and puns as my own, or even fuller. – [*Added* 1909:] Nevertheless, this objection led me to compare the technique of jokes with the dream-work; and the results are to be found in the book which I published on *Jokes and their Relation to the Unconscious* (1905*c*) [in particular in Chapter VI. – Towards the end of this chapter, Freud remarks that dream jokes are bad jokes, and explains why this should be so. The same point is made in Lecture XV of the *Introductory Lectures* (1916–17*a*). – The 'first reader' referred to above was Fliess, and the question is dealt with in a letter to him of September 11, 1899 (Freud, 1950*a*, Letter 118).]

name – that is '*meine Freud*' ['my delight']). The other part was derived from the English word 'hearsay'. This suggested slander and established the dream's connection with its indifferent instigator of the previous day: a poem in the periodical *Fliegende Blätter* about a slanderous dwarf called 'Sagter Hatergesagt' ['He-says Says-he']. If the syllable 'ing' were to be added to the name 'Fliess' we should get 'Vlissingen', which was, in fact, the stopping place on the sea voyage made by my brother whenever he visited us from England. But the English name for Vlissingen is 'Flushing', which in English means 'blushing' and reminded me of the patients I have treated for ereutophobia, and also of a recent paper on that neurosis by Bechterew which had caused me some annoyance.

v

[299] On another occasion I had a dream which consisted of two separate pieces. The first piece was the word '*Autodidasker*', which I recalled vividly. The second piece was an exact reproduction of a short and harmless phantasy which I had produced some days before. This phantasy was to the effect that when I next saw Professor N. I must say to him: 'The patient about whose condition I consulted you recently is, in fact, only suffering from a neurosis, just as you suspected.' Thus the neologism 'Autodidasker' must satisfy two conditions: firstly, it must bear or represent a composite meaning; and secondly, that meaning must be solidly related to the intention I had reproduced from waking life of making amends to Professor N.

The word 'Autodidasker' could easily be analysed into 'Autor' [author], 'Autodidakt' [self-taught] and 'Lasker', with which I also associated the name of Lassalle.[1] The first of these words led to the precipitating cause of the dream – this time a significant one. I had given my wife several volumes by a well-known [Austrian] writer who was a friend of my brother's, and who, as I have learnt, was a native of my own birthplace: J. J. David. One evening she had told me of the deep impression that had been made on her by the tragic story in one of David's books of how a man of talent went to the bad; and our conversation had turned to a discussion of the gifts of which we saw signs in our own children. Under the impact of what she had been reading, my wife expressed concern about the children, and I consoled her with the remark that

1 [Ferdinand Lassalle, founder of the German Social Democratic movement, was born at Breslau in 1825 and died in 1864. Eduard Lasker (1829–84), born at Jarotschin, not far from Breslau, was one of the founders of the National Liberal Party in Germany. Both were of Jewish origin.]

those were the very dangers which could be kept at bay by a good upbringing. My train of thought was carried further during the night; I took up my wife's concern and wove all kinds of other things into it. A remark made by the author to my brother on the subject of marriage showed my thoughts a bypath along which they might come to be represented in the dream. This path led to Breslau, where a lady with whom we were very friendly had gone to be married and settle down. The concern I felt over the danger of coming to grief over a woman – for that was the kernel of my dream thoughts – found an example in Breslau in the cases of Lasker and Lassalle which made it possible to give a simultaneous picture of the two ways in which this fatal influence can [300]
be exercised.[1] '*Cherchez la femme*', the phrase in which these thoughts could be summarized, led me, taken in another sense, to my still unmarried brother, whose name is Alexander. I now perceived that 'Alex', the shortened form of the name by which we call him, has almost the same sound as an anagram of 'Lasker', and that this factor must have had a share in leading my thoughts along the bypath by way of Breslau.

The play which I was making here upon names and syllables had a still further sense, however. It expressed a wish that my brother might have a happy domestic life, and it did so in this way. In Zola's novel of an artist's life, *L'oeuvre*, the subject of which must have been close to my dream thoughts, its author, as is well known, introduced himself and his own domestic happiness as an episode. He appears under the name of 'Sandoz'. The transformation was probably arrived at as follows. If 'Zola' is written backwards (the sort of thing children are so fond of doing), we arrive at 'Aloz'. No doubt this seemed too undisguised. He therefore replaced 'Al', which is the first syllable of 'Alexander', with 'Sand', which is the third syllable of the same name; and in this way 'Sandoz' came into being. My own 'Autodidasker' arose in much the same fashion.

I must now explain how my phantasy of telling Professor N. that the patient we had both examined was only suffering from a neurosis made its way into the dream. Shortly before the end of my working year, I began the treatment of a new patient who quite baffled my powers of diagnosis. The presence of a grave organic disease – perhaps some degeneration of the spinal cord – strongly suggested itself but could not be established. It would have been tempting to diagnose a neurosis (which

1 Lasker died of tabes, that is, as a result of an infection (syphilis) contracted from a woman; Lassalle, as everyone knows, fell in a duel on account of a woman. [George Meredith's *Tragic Comedians* is based on his story.]

would have solved every difficulty), if only the patient had not repudiated with so much energy the sexual history without which I refuse to recognize the presence of a neurosis. In my embarrassment I sought help from the physician whom I, like many other people, respect more than any as a man and before whose authority I am readiest to bow. He listened to my doubts, told me they were justified, and then gave his opinion: 'Keep the man under observation; it must be a neurosis.' Since
[301] I knew he did not share my views on the aetiology of the neuroses, I did not produce my counterargument, but I made no concealment of my scepticism. A few days later I informed the patient that I could do nothing for him and recommended him to seek other advice. Whereupon, to my intense astonishment, he started apologizing for having lied to me. He had been too much ashamed of himself, he said, and went on to reveal precisely the piece of sexual aetiology which I had been expecting and without which I had been unable to accept his illness as a neurosis. I was relieved but at the same time humiliated. I had to admit that my consultant, not being led astray by considering the anamnesis, had seen more clearly than I had. And I proposed to tell him as much when I next met him – to tell him that *he* had been right and *I* wrong.

This was precisely what I did in the dream. But what sort of a wish fulfilment can there have been in confessing that I was wrong? To be wrong was, however, just what I *did* wish. I wanted to be wrong in my fears, or, more precisely, I wanted my wife, whose fears I had adopted in the dream thoughts, to be wrong. The subject round which the question of right or wrong revolved in the dream was not far removed from what the dream thoughts were really concerned with. There was the same alternative between organic and functional damage caused by a woman, or, more properly, by sexuality: tabetic paralysis or neurosis? (The manner of Lassalle's death could be loosely classed in the latter category.)

In this closely knit and, when it was carefully interpreted, very transparent dream, Professor N. played a part not only on account of this analogy and of my wish to be wrong, and on account of his incidental connections with Breslau and with the family of our friend who had settled there after her marriage – but also on account of the following episode which occurred at the end of our consultation. When he had given his opinion and so concluded our medical discussion, he turned to more personal subjects: 'How many children have you got now?' – 'Six.' – He made a gesture of admiration and concern. – 'Girls or boys?' – 'Three and three: they are my pride and my treasure.' – 'Well,

now, be on your guard! Girls are safe enough, but bringing up boys leads to difficulties later on.' – I protested that mine had been very well behaved so far. Evidently this second diagnosis, on the future of my boys, pleased me no more than the earlier one, according to which [302] my patient was suffering from a neurosis. Thus these two impressions were bound up together by their contiguity, by the fact of their having been experienced both at once; and in taking the story of the neurosis into my dream, I was substituting it for the conversation about upbringing, which had more connection with the dream thoughts, since it touched so closely upon the worries later expressed by my wife. So even my fear that N. might be right in what he said about the difficulty of bringing up boys had found a place in the dream, for it lay concealed behind the representation of my wish that I myself might be wrong in harbouring such fears. The same phantasy served unaltered to represent both of the opposing alternatives.

VI

'Early this morning,[1] between dreaming and waking, I experienced a very nice example of verbal condensation. In the course of a mass of dream fragments that I could scarcely remember, I was brought up short, as it were, by a word which I saw before me as though it were half written and half printed. The word was "*erzefilisch*", and it formed part of a sentence which slipped into my conscious memory apart from any context and in complete isolation: "That has an *erzefilisch* influence on the sexual emotions." I knew at once that the word ought really to have been "*erzieherisch*" ["educational"]. And I was in doubt for some time whether the second "*e*" in "*erzefilisch*" should not have been an "*i*".[2] In that connection the word "syphilis" occurred to me and, starting to analyse the dream while I was still half-asleep, I racked my brains in an effort to make out how that word could have got into my dream, since I had nothing to do with the disease either personally or professionally. I then thought of "*erzehlerisch*" [another nonsense word], and this explained the "*e*" of the second syllable of [303] "*erzefilisch*" by reminding me that the evening before I had been asked

1 Quoted from Marcinowski [1911]. [This paragraph was added in 1914.]

2 [This ingenious example of condensation turns upon the pronunciation of the second syllable – the stressed syllable – of the nonsense word. If it is '*ze*', it is pronounced roughly like the English 'tsay', thus resembling the second syllable of '*erzählen*' and of the invented '*erzehlerisch*'. If it is '*zi*', it is pronounced roughly like the English 'tsee', thus resembling the second syllable of '*erzieherisch*', as well as (less closely) the first syllable of 'syphilis'.]

by our governess [*Erzieherin*] to say something to her on the problem of prostitution, and had given her Hesse's book on prostitution in order to influence her emotional life – for this had not developed quite normally; after which I had talked [*erzählt*] a lot to her on the problem. I then saw all at once that the word "syphilis" was not to be taken literally, but stood for "poison" – of course in relation to sexual life. When translated, therefore, the sentence in the dream ran quite logically: "My talk [*Erzählung*] was intended to have an educational [*erzieherisch*] influence on the emotional life of our governess [*Erzieherin*]; but I fear it may at the same time have had a poisonous effect." "*Erzefilisch*" was compounded from "*erzäh-*" and "*erzieh-*".'

The verbal malformations in dreams greatly resemble those which are familiar in paranoia but which are also present in hysteria and obsessions. The linguistic tricks performed by children,[1] who sometimes actually treat words as though they were objects and moreover invent new languages and artificial syntactic forms, are the common source of these things in dreams and psychoneuroses alike.

The analysis of the nonsensical verbal forms that occur in dreams[2] is particularly well calculated to exhibit the dream-work's achievements in the way of condensation. The reader should not conclude from the paucity of the instances which I have given that material of this kind is rare or observed at all exceptionally. On the contrary, it is very common. But as a result of the fact that dream interpretation is dependent upon psychoanalytic treatment, only a very small number of instances are observed and recorded and the analyses of such instances are as a rule only intelligible to experts in the pathology of the neuroses. Thus a dream of this kind was reported by Dr von Karpinska (1914) containing the nonsensical verbal form: '*Svingnum elvi*'. It is also worth mentioning those cases in which a word appears in a dream which is not in itself meaningless but which has lost its proper meaning and combines a number of other meanings to which it is related in just the same way as a 'meaningless' word would be. This is what occurred, for [304] instance, in the ten-year-old boy's dream of a 'category' which was recorded by Tausk (1913*b*). 'Category' in that case meant 'female genitals', and to 'categorate' meant the same as 'to micturate'.

1 [See Chapter IV of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 105, 110 f.]

2 [This paragraph was added in 1919.]

Where spoken sentences occur in dreams and are expressly distinguished as such from thoughts, it is an invariable rule that the words spoken in the dream are derived from spoken words remembered in the dream material. The text of the speech is either retained unaltered or expressed with some slight displacement. A speech in a dream is often put together from various recollected speeches, the text remaining the same but being given, if possible, several meanings, or one different from the original one. A spoken remark in a dream is not infrequently no more than an allusion to an occasion on which the remark in question was made.[1]

1 [*Footnote added* 1909:] Not long ago I found a single exception to this rule in the case of a young man who suffered from obsessions while retaining intact his highly developed intellectual powers. The spoken words which occurred in his dreams were not derived from remarks which he had heard or made himself. They contained the undistorted text of his obsessional thoughts, which in his waking life only reached his consciousness in a modified form. [This young man was the subject of Freud's case history of an obsessional neurotic (the 'Rat Man'); a reference to this point can be found there (Freud, 1909*d*) in Section II (A); *RSE*, **10**, 169 ff. – The question of spoken words in dreams is dealt with much more fully below on p. 374 ff.]

(B)
THE WORK OF DISPLACEMENT

[305] In making our collection of instances of condensation in dreams, the existence of another relation, probably of no less importance, had already become evident. It could be seen that the elements which stand out as the principal components of the manifest content of the dream are far from playing the same part in the dream thoughts. And, as a corollary, the converse of this assertion can be affirmed: what is clearly the essence of the dream thoughts need not be represented in the dream at all. The dream is, as it were, *differently centred* from the dream thoughts – its content has different elements as its central point. Thus in the dream of the botanical monograph [p. 149 ff. above], for instance, the central point of the dream content was obviously the element 'botanical'; whereas the dream thoughts were concerned with the complications and conflicts arising between colleagues from their professional obligations, and further with the charge that I was in the habit of sacrificing too much for the sake of my hobbies. The element 'botanical' had no place whatever in this core of the dream thoughts, unless it was loosely connected with it by an antithesis – the fact that botany never had a place among my favourite studies. In my patient's *Sappho* dream [p. 253 ff.] the central position was occupied by climbing up and down and being up above and down below; the dream thoughts, however, dealt with the dangers of sexual relations with people of an inferior social class. So that only a single element of the dream thoughts seems to have found its way into the dream content, though that element was expanded to a disproportionate extent. Similarly, in the dream of the may-beetles [p. 257 ff.], the topic of which was the relations of sexuality to cruelty, it is true that the factor of cruelty emerged in the dream content; but it did so in another connection and without any mention of sexuality, that is to say, divorced from its context and consequently transformed into something extraneous. Once again, in my dream about my uncle [p. 122 ff.], the fair beard which formed its centre
[306] point seems to have had no connection in its meaning with my ambitious wishes which, as we saw, were the core of the dream thoughts. Dreams such as these give a justifiable impression of 'displacement' [*Verschiebung*][T]. In complete contrast to these examples, we can see that in the dream of Irma's injection [p. 94 ff.] the different elements were

able to retain, during the process of constructing the dream, the approximate place which they occupied in the dream thoughts. This further relation between the dream thoughts and the dream content, wholly variable as it is in its sense or direction, is calculated at first to create astonishment. If we are considering a psychical process in normal life and find that one out of its several component ideas has been picked out and has acquired a special degree of vividness in consciousness, we usually regard this effect as evidence that a specially high amount of psychical value – some particular degree of interest – attaches to this predominant idea. But we now discover that, in the case of the different elements of the dream thoughts, a value of this kind does not persist or is disregarded in the process of dream formation. There is never any doubt as to which of the elements of the dream thoughts have the highest psychical value; we learn that by direct judgement. In the course of the formation of a dream these essential elements, charged, as they are, with intense interest, may be treated as though they were of small value, and their place may be taken in the dream by other elements, of whose small value in the dream thoughts there can be no question. At first sight it looks as though no attention whatever is paid to the psychical intensity[1] of the various ideas in making the choice among them for the dream, and as though the only thing considered is the greater or lesser degree of multiplicity of their determination. What appears in dreams, we might suppose, is not what is *important* in the dream thoughts but what occurs in them several times over. But this hypothesis does not greatly assist our understanding of dream formation, since from the nature of things it seems clear that the two factors of multiple determination and inherent psychical value must necessarily operate in the same sense. The ideas which are most important among the dream thoughts will almost certainly be those which occur most often in them, since the different dream thoughts will, as it were, radiate out from them. Nevertheless, a [307] dream can reject elements which are thus both highly stressed in themselves and reinforced from many directions, and can select for its content other elements which possess only the second of these attributes.

In order to solve this difficulty we shall make use of another impression derived from our enquiry [in the previous section] into the overdetermination of the dream content. Perhaps some of those who have read that enquiry may already have formed an independent

1 *Psychical* intensity or value or the degree of interest of an idea is of course to be distinguished from *sensory* intensity or the intensity of the image presented.

conclusion that the overdetermination of the elements of dreams is no very important discovery, since it is a self-evident one. For in analysis we start out from the dream elements and note down all the associations which lead off from them; so that there is nothing surprising in the fact that in the thought material arrived at in this way we come across these same elements with peculiar frequency. I cannot accept this objection; but I will myself put into words something that sounds not unlike it. Among the thoughts that analysis brings to light are many which are relatively remote from the kernel of the dream and which look like artificial interpolations made for some particular purpose. That purpose is easy to divine. It is precisely *they* that constitute a connection, often a forced and far-fetched one, between the dream content and the dream thoughts; and if these elements were weeded out of the analysis the result would often be that the component parts of the dream content would be left not only without overdetermination but without any satisfactory determination at all. We shall be led to conclude that the multiple determination which decides what shall be included in a dream is not always a primary factor in dream construction but is often the secondary product of a psychical force which is still unknown to us. Nevertheless, multiple determination must be of importance in choosing what particular elements shall enter a dream, since we can see that a considerable expenditure of effort is used to bring it about in cases where it does not arise from the dream material unassisted.

It thus seems plausible to suppose that in the dream-work a psychical force is operating which on the one hand strips the elements which have a high psychical value of their intensity, and on the other hand, *by means of overdetermination*, creates from elements of low psychical value new values, which afterwards find their way into the dream content. If that is so, *a transference and displacement of psychical intensities* occurs in the process of dream formation, and it is as a result of these [308] that the difference between the text of the dream content and that of the dream thoughts comes about. The process which we are here presuming is nothing less than the essential portion of the dream-work; and it deserves to be described as 'dream displacement'. Dream displacement and dream condensation are the two governing factors[t] to whose activity we may in essence ascribe the form assumed by dreams.

Nor do I think we shall have any difficulty in recognizing the psychical force which manifests itself in the facts of dream displacement. The consequence of the displacement is that the dream content no longer resembles the core of the dream thoughts and that the dream gives no

more than a distortion of the dream wish which exists in the unconscious. But we are already familiar with dream distortion. We traced it back to the censorship which is exercised by one psychical agency in the mind over another. [See p. 125 ff. above.] Dream displacement is one of the chief methods by which that distortion is achieved. *Is fecit cui profuit*.[1] We may assume, then, that dream displacement comes about through the influence of the same censorship – that is, the censorship of endopsychic defence [*Abwehr*].[2]

The question of the interplay of these factors – of displacement, condensation and overdetermination – in the construction of dreams, and the question which is a dominant factor and which a subordinate one – all of this we shall leave aside for later investigation. [See e.g. p. 362 ff.] But we can state provisionally a second condition which must be satisfied by those elements of the dream thoughts which make their way into the dream: *they must escape the censorship imposed by resistance*.[3] And henceforward in interpreting dreams we shall take dream displacement into account as an undeniable fact.

1 [The old legal tag: 'He did the deed who gained by it.']

2 [*Footnote added* 1909:] Since I may say that the kernel of my theory of dreams lies in my derivation of dream distortion from the censorship, I will here insert the last part of a story from *Phantasien eines Realisten* [*Phantasies of a Realist*] by 'Lynkeus' (Vienna, 2nd edition, 1900 [1st edition, 1899]), in which I have found this principal feature of my theory once more expounded. [See above, Postscript, 1909, to Chapter I, p. 84; also Freud, 1923*f*; *RSE*, **19**; and 1932*c*; ibid., **22**.] The title of the story is 'Träumen wie Wachen' ['Dreaming like Waking']:

'About a man who has the remarkable attribute of never dreaming nonsense . . .

'"This splendid gift of yours, for dreaming as though you were waking, is a consequence of your virtues, of your kindness, your sense of justice, and your love of truth; it is the moral serenity of your nature which makes me understand all about you." [309]

'"But when I think the matter over properly", replied the other, "I almost believe that everyone is made like me, and that no-one at all ever dreams nonsense. Any dream which one can remember clearly enough to describe it afterwards – any dream, that is to say, which is not a fever dream – must *always* make sense, and it cannot possibly be otherwise. For things that were mutually contradictory could not group themselves into a single whole. The fact that time and space are often thrown into confusion does not affect the true content of the dream, since no doubt neither of them is of significance for its real essence. We often do the same thing in waking life. Only think of fairy tales and of the many daring products of the imagination, which are full of meaning and of which only a man without intelligence could say: 'This is nonsense, for it's impossible.'"

'"If only one always knew how to interpret dreams in the right way, as you have just done with mine!" said his friend.

'"That is certainly no easy task; but with a little attention on the part of the dreamer himself it should no doubt always succeed. – You ask why it is that for the most part it does *not* succeed? In you other people there seems always to be something that lies concealed in your dreams, something unchaste in a special and higher sense, a certain secret quality in your being which it is hard to follow. And that is why your dreams so often seem to be without meaning or even to be nonsense. But in the deepest sense this is not in the least so; indeed, it cannot be so at all – for it is always the same man, whether he is awake or dreaming."'

3 [The first condition being that they must be overdetermined. (See p. 273 f. above.)]

(C)
THE MEANS OF REPRESENTATION IN DREAMS

[310] In the process of transforming the latent thoughts into the manifest content of a dream we have found two factors at work: dream condensation and dream displacement. As we continue our investigation we shall, in addition to these, come across two further determinants which exercise an undoubted influence on the choice of the material which is to find access to the dream.

But first, even at the risk of appearing to bring our progress to a halt, I should like to take a preliminary glance at the processes involved in carrying out the interpretation of a dream. I cannot disguise from myself that the easiest way of making those processes clear and of defending their trustworthiness against criticism would be to take some particular dream as a sample, go through its interpretation (just as I have done with the dream of Irma's injection in my second chapter), and then collect the dream thoughts which I have discovered and go on to reconstruct from them the process by which the dream was formed – in other words, to complete a dream analysis by a dream synthesis. I have in fact carried out that task for my own instruction on several specimens; but I cannot reproduce them here, since I am forbidden to do so for reasons connected with the nature of the psychical material involved – reasons which are of many kinds and which will be accepted as valid by any reasonable person. Such considerations interfered less in the *analysis* of dreams, since an analysis could be incomplete and nevertheless retain its value, even though it penetrated only a small way into the texture of the dream. But in the case of the *synthesis* of a dream I do not see how it can be convincing unless it is complete. I could only give a complete synthesis of dreams dreamt by people unknown to the reading public. Since, however, this condition is fulfilled only by my patients, who are neurotics, I must postpone this part of my exposition of the subject till I am able – in another volume – to carry the psychological elucidation of neuroses to a point at which it can make contact with our present topic.[1]

1 [*Footnote added* 1909:] Since writing the above words, I have published a complete analysis and synthesis of two dreams in my 'Fragment of an Analysis of a Case of Hysteria' [Freud, 1905*e* (Sections II and III); *RSE*, **7**, 57 ff. See also the synthesis of the 'Wolf Man's' dream in Section IV of Freud (1918*b*), ibid., **17**, 26 ff. – *Added* 1914:] Otto Rank's analysis, 'Ein Traum, der sich selbst deutet' ['A Dream which Interprets Itself', 1910*d*], deserves mention as the most complete interpretation that has been published of a dream of considerable length.

My attempts at building up dreams by synthesis from the dream thoughts have taught me that the material which emerges in the course of interpretation is not all of the same value. One part of it is made up of the essential dream thoughts – those, that is, which completely replace the dream, and which, if there were no censorship of dreams, would be sufficient in themselves to replace it. The other part of the material is usually to be regarded as of less importance. Nor is it possible to support the view that all the thoughts of this second kind had a share in the formation of the dream. [See pp. 249 above and 475 below.] On the contrary, there may be associations among them which relate to events that occurred *after* the dream, between the times of dreaming and interpreting. This part of the material includes all the connecting paths that led from the manifest dream content to the latent dream thoughts, as well as the intermediate and linking associations by means of which, in the course of the process of interpretation, we came to discover these connecting paths.[1] [311]

We are here interested only in the essential dream thoughts. These usually emerge as a complex of thoughts and memories of the most intricate possible structure, with all the attributes of the trains of thought familiar to us in waking life. They are not infrequently trains of thought starting out from more than one centre, though having points of contact. Each train of thought is almost invariably accompanied by its contradictory counterpart, linked with it by antithetical association. [312]

The different portions of this complicated structure stand, of course, in the most manifold logical relations to one another. They can represent foreground and background, digressions and illustrations, conditions, chains of evidence and counterarguments. When the whole mass of these dream thoughts is brought under the pressure of the dream-work, and its elements are turned about, broken into fragments and jammed together – almost like pack-ice – the question arises of what

1 [The last four sentences (beginning with 'The other part of the material') date in their present form from 1919. In editions earlier than that, this passage ran as follows: 'The other part of the material may be brought together under the term "collaterals". As a whole, they constitute the paths over which the true wish, which arises from the dream thoughts, passes before becoming the dream wish. The first set of these "collaterals" consist in derivatives from the dream thoughts proper; they are, schematically regarded, displacements from what is essential to what is inessential. A second set of them comprise the thoughts that connect these inessential elements (which have become important owing to displacement) with one another, and extend from them to the dream content. Finally, a third set consist in the associations and trains of thought by means of which the work of interpretation leads us from the dream content to the second group of collaterals. It need not be supposed that the whole of this third set were necessarily also concerned in the formation of the dream.' With reference to this passage Freud remarks in *GS*, **3** (1925), 55, that he has dropped the term 'collaterals'. In fact, however, the term has survived below on p. 475.]

happens to the logical connections which have hitherto formed its framework. What representation do dreams provide for 'if', 'because', 'just as', 'although', 'either–or', and all the other conjunctions without which we cannot understand sentences or speeches?

In the first resort our answer must be that dreams have no means at their disposal for representing these logical relations between the dream thoughts. For the most part dreams disregard all these conjunctions, and it is only the substantive content of the dream thoughts that they take over and manipulate.[1] The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the interpretative process.

The incapacity of dreams to express these things must lie in the nature of the psychical material out of which dreams are made. The plastic arts of painting and sculpture labour, indeed, under a similar limitation as compared with poetry, which can make use of speech; and here once again the reason for their incapacity lies in the nature of the material which these two forms of art manipulate in their effort to express something. Before painting became acquainted with the laws of expression by which it is governed, it made attempts to get over this handicap. In ancient paintings small labels were hung from the mouths of the persons represented, containing in written characters the speeches which the artist despaired of representing pictorially.

[313] At this point an objection may perhaps be raised in dispute of the idea that dreams are unable to represent logical relations. For there are dreams in which the most complicated intellectual operations take place, statements are contradicted or confirmed, ridiculed or compared, just as they are in waking thought. But here again appearances are deceitful. If we go into the interpretation of dreams such as these, we find that the whole of this *is part of the material of the dream thoughts and is not a representation of intellectual work performed during the dream itself*. What is reproduced by the ostensible thinking in the dream is the *subject matter* of the dream thoughts and not the *mutual relations between them*, the assertion of which constitutes thinking. I shall bring forward some instances of this. [See p. 394 ff. below.] But the easiest point to establish in this connection is that all spoken sentences which occur in dreams and are specifically described as such are unmodified or slightly modified reproductions of speeches which are also to be found among the recollections in the material of the dream thoughts. A speech of this kind is often no more than an allusion to some event

1 [A qualification of this statement can be found below, p. 402 *n*.]

included among the dream thoughts, and the meaning of the dream may be a totally different one. [See p. 374 ff. below.]

Nevertheless, I will not deny that critical thought activity which is not a mere repetition of material in the dream thoughts *does* have a share in the formation of dreams. I shall have to elucidate the part played by this factor at the end of the present discussion. It will then become apparent that this thought activity is not produced by the dream thoughts but by the dream itself after it has already, in a certain sense, been completed. [See the last section of this chapter (p. 437).]

Provisionally, then, it may be said that the logical relations between the dream thoughts are not given any separate representation in dreams. For instance, if a contradiction occurs in a dream, it is either a contradiction of the dream itself or a contradiction derived from the subject matter of one of the dream thoughts. A contradiction in a dream can only correspond in an exceedingly indirect manner to a contradiction *between* the dream thoughts. But just as the art of painting eventually found a way of expressing, by means other than the floating labels, at least the *intention* of the words of the personages represented – affection, threats, warnings, and so on – so too there is a possible means by which dreams can take account of some of the logical relations between their dream thoughts, by making an appropriate modification in the [314]
method of representation characteristic of dreams. Experience shows that different dreams vary greatly in this respect. While some dreams completely disregard the logical sequence of their material, others attempt to give as full an indication of it as possible. In doing so dreams depart sometimes more and sometimes less widely from the text that is at their disposal for manipulation. Incidentally dreams vary similarly in their treatment of the *chronological* sequence of the dream thoughts, if such a sequence has been established in the unconscious (as, for instance, in the dream of Irma's injection [p. 94 ff.]).

What means does the dream-work possess for indicating these relations in the dream thoughts which it is so hard to represent? I will attempt to enumerate them one by one.

In the first place, dreams take into account in a general way the connection which undeniably exists between all the portions of the dream thoughts by combining the whole material into a single situation or event. They reproduce *logical connection* by *simultaneity in time*. Here they are acting like the painter who, in a picture of the School of Athens or of Parnassus, represents in one group all the philosophers or all the

poets.[1] It is true that they were never, in fact, assembled in a single hall or on a single mountain-top; but they certainly form a group in the conceptual sense.

Dreams carry this method of reproduction down to details. Whenever they show us two elements close together, this guarantees that there is some specially intimate connection between what correspond to them among the dream thoughts. In the same way, in our system of writing, '*ab*' means that the two letters are to be pronounced in a single syllable. If a gap is left between the '*a*' and the '*b*' , it means that the '*a*' is the last letter of one word and the '*b*' is the first of the next one.[2] So, too, collocations in dreams do not consist of any chance, disconnected portions of the dream material, but of portions which are fairly closely connected in the dream thoughts as well.

[315] For representing *causal relations* dreams have two procedures which are in essence the same. Suppose the dream thoughts run like this: 'Since this was so and so, such and such was bound to happen.' Then the commoner method of representation would be to introduce the dependent clause as an introductory dream and to add the principal clause as the main dream. If I have interpreted aright, the temporal sequence may be reversed. But the more extensive part of the dream always corresponds to the principal clause.

One of my women patients once produced an excellent instance of this way of representing causality in a dream which I shall later record fully. [See p. 310 ff. below; also discussed on pp. 284 and 289.] It consisted of a short prelude and a very diffuse piece of dream which was centred to a marked degree on a single theme and might be entitled 'The Language of Flowers'.

The introductory dream was as follows: *She went into the kitchen, where her two maids were, and found fault with them for not having got her 'bite of food' ready. At the same time she saw a very large quantity of common kitchen crockery standing upside down in the kitchen to drain; it was piled up in heaps. The two maids went to fetch some water and had to step into a kind of river which came right up to the house or into the yard.* The main dream then followed, beginning thus: *She was*

1 [Raphael's frescoes in the Vatican. Freud referred to them again in 'On Dreams', *RSE*, **5**, 596, and in his paper 'Thoughts for the Times on War and Death' (1915*b*), ibid., **14**, 277.]

2 [This simile is a favourite one of Freud's. He uses it above on pp. 219–20 and again in the middle of Section I of the case history of 'Dora' (1905*e*), *RSE*, **7**, 35–6. The same image occurs in Goethe's lyric 'Schwer in Waldes Busch'.]

descending from a height over some strangely constructed palisades, and felt glad that her dress was not caught in them . . . etc.

The introductory dream related to the dreamer's parents' home. No doubt she had often heard her mother using the words that occurred in the dream. The heaps of common crockery were derived from a modest hardware shop which was located in the same building. The other part of the dream contained a reference to her father, who used always to run after the maids and who eventually contracted a fatal illness during a flood. (The house stood near a riverbank.) Thus the thought concealed behind the introductory dream ran as follows: 'Because I was born in this house, in such mean and depressing circumstances . . .' The main dream took up the same thought and presented it in a form modified by wish fulfilment: 'I am of high descent.' Thus the actual underlying thought was: 'Because I am of such low descent, the course of my life has been so and so.'

The division of a dream into two unequal parts does not invariably, so far as I can see, signify that there is a causal relation between the thoughts behind the two parts. It often seems as though the same material were being represented in the two dreams from different points of view. (This is certainly the case where a series of dreams during one night end in an emission or orgasm – a series in which the somatic need finds its way to progressively clearer expression.)[1] Or the two dreams may have sprung from separate centres in the dream material, and their content may overlap, so that what is the centre in one dream is present as a mere hint in the other, and *vice versa*. But in a certain number of dreams a division into a shorter preliminary dream and a longer sequel does in fact signify that there is a causal relation between the two pieces. [316]

The other method of representing a causal relation is adapted to less extensive material and consists in one image in the dream, whether of a person or thing, being transformed into another. The existence of a causal relation is only to be taken seriously if the transformation actually occurs before our eyes and not if we merely notice that one thing has appeared in the place of another.

I have said that the two methods of representing a causal relation were in essence the same. In both cases causation is represented by *temporal sequence*: in one instance by a sequence of dreams and in the other by the direct transformation of one image into another. In the great majority of cases, it must be confessed, the causal relation is not

1 [This sentence was added in 1914. The point is further mentioned on p. 298 below and discussed at greater length on pp. 359–60. The whole subject of dreams occurring on the same night is dealt with on p. 297 f.]

represented at all but is lost in the confusion of elements which inevitably occurs in the process of dreaming.

The alternative 'either–or' cannot be expressed in dreams in any way whatever. Both of the alternatives are usually inserted in the text of the dream as though they were equally valid. The dream of Irma's injection contains a classic instance of this. Its latent thoughts clearly ran [see p. 106 f. above]: 'I am not responsible for the persistence of Irma's pains; the responsibility lies *either* in her recalcitrance to accepting my solution, *or* in the unfavourable sexual conditions under which she lives and which I cannot alter, *or* in the fact that her pains are not hysterical
[317] at all but of an organic nature.' The dream, on the other hand, fulfilled *all* of these possibilities (which were almost mutually exclusive), and did not hesitate to add a fourth solution, based on the dream wish. After interpreting the dream, I proceeded to insert the 'either–or' into the context of the dream thoughts.

If, however, in reproducing a dream, its narrator feels inclined to make use of an 'either–or' – e.g. 'it was either a garden or a sitting room' – what was present in the dream thoughts was not an alternative but an 'and', a simple addition. An 'either–or' is mostly used to describe a dream element that has a quality of vagueness – which, however, is capable of being resolved. In such cases the rule for interpretation is: treat the two apparent alternatives as of equal validity and link them together with an 'and'.

For instance, on one occasion a friend of mine was stopping in Italy and I had been without his address for a considerable time. I then had a dream of receiving a telegram containing this address. I saw it printed in blue on the telegraph form. The first word was vague:

'*Via*', perhaps
or '*Villa*'
or possibly even ('*Casa*')
} ; the second was clear: '*Secerno*'.

The second word sounded like some Italian name and reminded me of discussions I had had with my friend on the subject of etymology. It also expressed my anger with him for having kept his address *secret* from me for so long. On the other hand, each of the three alternatives for the first word turned out on analysis to be an independent and equally valid starting point for a chain of thoughts.[1]

1 [This dream can be found described in greater detail in Freud's letter to Fliess (the friend in question) of April 28, 1897. See Freud, 1950*a*, Letter 60.]

During the night before my father's funeral I had a dream of a printed notice, placard or poster – rather like the notices forbidding one to smoke in railway waiting rooms – on which appeared either

'You are requested to close the eyes'
or, 'You are requested to close an eye'.

I usually write this in the form: [318]

'You are requested to close { the / an } eye(s).'

Each of these two versions had a meaning of its own and led in a different direction when the dream was interpreted. I had chosen the simplest possible ritual for the funeral, for I knew my father's own views on such ceremonies. But some other members of the family were not sympathetic to such puritanical simplicity and thought we should be disgraced in the eyes of those who attended the funeral. Hence one of the versions: 'You are requested to close an eye', i.e. to 'wink at' or 'overlook'. Here it is particularly easy to see the meaning of the vagueness expressed by the 'either–or'. The dream-work failed to establish a unified wording for the dream thoughts which could at the same time be ambiguous, and the two main lines of thought consequently began to diverge even in the manifest content of the dream.[1]

In a few instances the difficulty of representing an alternative is got over by dividing the dream into two pieces of equal length.

The way in which dreams treat the category of contraries and contradictories is highly remarkable. It is simply disregarded. 'No' seems not to exist so far as dreams are concerned.[2] They show a particular preference for combining contraries into a unity or for representing them as one and the same thing. Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of

1 [This dream is reported by Freud in a letter to Fliess of November 2, 1896. (See Freud, 1950*a*, Letter 50.) It is there stated to have occurred during the night *after* the funeral. In its first wording the dream referred to closing the dead man's eyes as a filial duty.]

2 [Qualifications of this assertion occur on pp. 290 f., 300 and 388 below.]

deciding at first glance whether any element that admits of a contrary is present in the dream thoughts as a positive or as a negative.[1]

[319] In one of the dreams recorded just above, the first clause of which has already been interpreted ('because my descent was such and such' [see p. 280 f. above]), the dreamer saw herself climbing down over some palisades holding a blossoming branch in her hand. In connection with this image she thought of the angel holding a spray of lilies in pictures of the Annunciation – her own name was Maria – and of girls in white robes walking in Corpus Christi processions, when the streets are decorated with green branches. Thus the blossoming branch in the dream without any doubt alluded to sexual innocence. However, the branch was covered with *red* flowers, each of which was like a camellia. By the end of her walk – so the dream went on – the blossoms were already a good deal faded. There then followed some unmistakable allusions to menstruation. Accordingly, the same branch which was carried like a lily and as though by an innocent girl was at the same time an allusion to the *Dame aux camélias* who, as we know, usually wore a white camellia, except during her periods, when she wore a red one. The same blossoming branch (cf. 'des Mädchens Blüten' ['the maiden's blossoms'] in Goethe's poem ['Der Müllerin Verrat']) represented both sexual innocence and its contrary. And the same dream which expressed her joy at having succeeded in passing through life immaculately gave one glimpses at certain points (e.g. in the fading of the blossoms) of the contrary train of ideas – of her having been guilty of various sins against sexual purity (in her childhood, that is). In analysing the dream it was possible clearly to distinguish the two trains of thought, of which the consoling one seemed the more superficial and the self-reproachful one the deeper-lying – trains of thought which were diametrically opposed to each other but whose similar though contrary elements were represented by the same elements in the manifest dream.[2]

1 [*Footnote added* 1911:] I was astonished to learn from a pamphlet by K. Abel, *The Antithetical Meaning of Primal Words* (1884) (cf. my review of it, 1910*e*) – and the fact has been confirmed by other philologists – that the most ancient languages behave exactly like dreams in this respect. In the first instance they have only a single word to describe the two contraries at the extreme ends of a series of qualities or activities (e.g. 'strong–weak', 'old–young', 'far–near', 'bind–sever'); they only form distinct terms for the two contraries by a secondary process of making small modifications in the common word. Abel demonstrates this particularly from ancient Egyptian; but he shows that there are distinct traces of the same course of development in the Semitic and Indo-Germanic languages as well. [See also p. 421 below.]

2 [The dream is fully reported on p. 311 f. below.]

One and one only of these logical relations is very highly favoured by the mechanism of dream formation; namely, the relation of similarity, [320]
consonance or approximation – the relation of 'just as'. This relation, unlike any other, is capable of being represented in dreams in a variety of ways.[1] Parallels or instances of 'just as' inherent in the material of the dream thoughts constitute the first foundations for the construction of a dream; and no inconsiderable part of the dream-work consists in creating fresh parallels where those which are already present cannot find their way into the dream owing to the censorship imposed by resistance. The representation of the relation of similarity is assisted by the tendency of the dream-work towards condensation.

Similarity, consonance, the possession of common attributes – all these are represented in dreams by unification, which may either be present already in the material of the dream thoughts or may be freshly constructed. The first of these possibilities may be described as 'identification' and the second as 'composition'. Identification is employed where *persons* are concerned; composition where *things* are the material of the unification. Nevertheless, composition may also be applied to persons. Localities are often treated like persons.

In identification, only one of the persons who are linked by a common element succeeds in being represented in the manifest content of the dream, while the second or remaining persons seem to be suppressed in it. But this single covering figure appears in the dream in all the relations and situations which apply either to him or to the figures which he covers. In composition, where this is extended to persons, the dream image contains features which are peculiar to one or other of the persons concerned but not common to them; so that the combination of these features leads to the appearance of a new unity, a composite figure. The actual process of composition can be carried out in various ways. On the one hand, the dream figure may bear the name of one of the persons related to it – in which case we simply know directly, in a manner analogous to our waking knowledge, that this or that person is intended – while its visual features may belong to the other person. Or, on the other hand, the dream image itself may be composed of visual features belonging in reality partly to the one person and partly to the other. Or again the second person's share in the dream image may lie, [321]
not in its visual features, but in the gestures that we attribute to it, the words that we make it speak, or the situation in which we place it. In

1 [*Footnote added* 1914:] Cf. Aristotle's remark on the qualifications of a dream interpreter quoted above on p. 87 *n.* 2.

this last case the distinction between identification and the construction of a composite figure begins to lose its sharpness.[1] But it may also happen that the formation of a composite figure of this kind is unsuccessful. If so, the scene in the dream is attributed to *one* of the persons concerned, while the other (and usually the more important one) appears as an attendant figure without any other function. The dreamer may describe the position in such a phrase as: 'My mother was there as well.' (Stekel.) An element of this kind in the dream content may be compared to the 'determinatives' used in hieroglyphic script, which are not meant to be pronounced but serve merely to elucidate other signs.

The common element which justifies, or rather causes, the combination of the two persons may be represented in the dream or may be omitted from it. As a rule the identification or construction of a composite person takes place for the very purpose of avoiding the representation of the common element. Instead of saying: '*A* has hostile feelings towards me and so has *B*', I make a composite figure out of *A* and *B* in the dream, or I imagine *A* performing an act of some other kind which is characteristic of *B*. The dream figure thus constructed appears in the dream in some quite new connection, and the circumstance that it represents both *A* and *B* justifies me in inserting at the appropriate point in the dream the element which is common to both of them, namely a hostile attitude towards me. It is often possible in this way to achieve quite a remarkable amount of condensation in the content of a dream; I can save myself the need for giving a direct representation of very complicated circumstances relating to one person, if I can find another person to whom some of these circumstances apply equally. It is easy to see, too, how well this method of representation by means of identification can serve to evade the censorship due to resistance, which imposes such severe conditions upon the dream-work. What the censor-
[322] ship objects to may lie precisely in certain ideas which, in the material of the dream thoughts, are attached to a particular person; so I proceed to find a second person, who is also connected with the objectionable material, but only with part of it. The contact between the two persons upon this censorable point now justifies me in constructing a composite figure characterized by indifferent features derived from both. This figure, arrived at by identification or composition, is then admissible to the

1 [On the subject of composite figures cf. also p. 260 ff. above. The next three sentences were added in 1911. The final sentence of the paragraph was added in 1914. – 'Identification' in this passage is evidently being used in a sense different from that discussed on p. 132 ff. above.]

dream content without censorship, and thus, by making use of dream condensation, I have satisfied the claims of the dream censorship.

When a common element between two persons is represented in a dream, it is usually a hint for us to look for another, concealed common element whose representation has been made impossible by the censorship. A displacement in regard to the common element has been made in order, as it were, to facilitate its representation. The fact that the composite figure appears in the dream with an indifferent common element leads us to conclude that there is another far from indifferent common element present in the dream thoughts.

Accordingly, identification or the construction of composite figures serves various purposes in dreams: firstly to represent an element common to two persons, secondly to represent a *displaced* common element, and thirdly, too, to express a merely *wishful* common element. Since wishing that two persons had a common element frequently coincides with exchanging one for the other, this latter relation is also expressed in dreams by means of identification. In the dream of Irma's injection, I wished to exchange her for another patient: I wished, that is, that the other woman might be my patient just as Irma was. The dream took this wish into account by showing me a person who was called Irma, but who was examined in a position in which I had only had occasion to see the other woman [p. 97 f. above]. In the dream about my uncle an exchange of this kind became the central point of the dream: I identified myself with the minister by treating and judging my colleagues no better than he did. [p. 170 f.]

It is my experience, and one to which I have found no exception, that every dream deals with the dreamer himself. Dreams are completely egoistic.[1] Whenever my own ego does not appear in the content of the [323]
dream, but only some extraneous person, I may safely assume that my own ego lies concealed, by identification, behind this other person; I can insert my ego into the context. On other occasions, when my own ego *does* appear in the dream, the situation in which it occurs may teach me that some other person lies concealed, by identification, behind my ego. In that case the dream should warn me to transfer on to myself, when I am interpreting the dream, the concealed common element attached to this other person. There are also dreams in which my ego appears along with other people who, when the identification is resolved, are revealed once again as my ego. These identifications should then make it possible for me to bring into contact with my ego certain ideas whose acceptance

1 [*Footnote added* 1925:] Cf. the footnote on p. 240.

has been forbidden by the censorship. Thus my ego may be represented in a dream several times over, now directly and now through identification with extraneous persons. By means of a number of such identifications it becomes possible to condense an extraordinary amount of thought material.[1] The fact that the dreamer's own ego appears several times, or in several forms, in a dream is at bottom no more remarkable than that the ego should be contained in a conscious thought several times or in different places or connections – e.g. in the sentence 'when *I* think what a healthy child *I* was'.[2]

Identifications in the case of proper names of *localities* are resolved even more easily than in the case of persons, since here there is no interference by the ego, which occupies such a dominating place in dreams. In one of my dreams about Rome (see p. 172 f.), the place in which I found myself was called Rome, but I was astonished at the quantity of German posters at a street corner. This latter point was a wish fulfilment, which at once made me think of Prague; and the wish itself may perhaps have dated from a German Nationalist phase which I passed through during my youth, but have since got over.[3] At the time
[324] at which I had the dream there was a prospect of my meeting my friend [Fliess] in Prague; so that the identification of Rome and Prague can be explained as a wishful common element: I would rather have met my friend in Rome than in Prague and would have liked to exchange Prague for Rome for the purpose of this meeting.

The possibility of creating composite structures stands foremost among the characteristics which so often lend dreams a fantastic appearance, for it introduces into the content of dreams elements which could never have been objects of actual perception.[4] The psychical process of constructing composite images in dreams is evidently the same as when we imagine or portray a centaur or a dragon in waking life. The only difference is that what determines the production of the imaginary figure in waking life is the impression which the new structure itself is intended to make; whereas the formation of the composite structure in a dream is determined by a factor extraneous to its actual shape – namely

1 When I am in doubt behind which of the figures appearing in the dream my ego is to be looked for, I observe the following rule: the person who in the dream feels an emotion which I myself experience in my sleep is the one who conceals my ego.

2 [This sentence was added in 1925. The point is dealt with further in Freud, 1923*c*, Section X; *RSE*, **19**, 109 f.]

3 [Cf. the 'Revolutionary' dream, pp. 186 f. and 189 above.]

4 [Some amusing instances are given at the end of Section IV of Freud's short essay on dreams (1901*a*), *RSE*, **5**, 589.]

the common element in the dream thoughts. Composite structures in dreams can be formed in a great variety of ways. The most naive of these procedures merely represents the attributes of one thing to the accompaniment of a knowledge that they also belong to something else. A more painstaking technique combines the features of both objects into a new image and in so doing makes clever use of any similarities that the two objects may happen to possess in reality. The new structure may seem entirely absurd or may strike us as an imaginative success, according to the material and to the ingenuity with which it is put together. If the objects which are to be condensed into a single unity are much too incongruous, the dream-work is often content with creating a composite structure with a comparatively distinct nucleus, accompanied by a number of less distinct features. In that case the process of unification into a single image may be said to have failed. The two representations are superimposed and produce something in the nature of a contest between the two visual images. One might arrive at similar representations in a drawing, if one tried to illustrate the way in which a general concept is formed from a number of individual perceptual images.

Dreams are, of course, a mass of these composite structures. I have [325]
given some examples of them in dreams that I have already analysed; and I will now add a few more. In the dream reported below on p. 310 ff. [also above, pp. 280 f. and 284], which describes the course of the patient's life 'in the language of flowers', the dream ego held a blossoming branch in her hand which, as we have seen, stood both for innocence and for sexual sinfulness. The branch, owing to the way in which the blossoms were placed on it, also reminded the dreamer of *cherry* blossom; the blossoms themselves, regarded individually, were *camellias*, and moreover the general impression was of an *exotic* growth. The common factor among the elements of this composite structure was shown by the dream thoughts. The blossoming branch was composed of allusions to gifts made to her in order to win, or attempt to win, her favour. Thus she had been given *cherries* in her childhood and, later in life, a *camellia* plant; while '*exotic*' was an allusion to a much-travelled naturalist who had tried to win her favour with a flower drawing. – Another of my women patients produced in one of her dreams a thing that was intermediate between a bathing-hut at the seaside, an outside closet in the country and an attic in a town house. The first two elements have in common a connection with people naked and undressed; and their combination with the third element leads to the conclusion that (in her childhood) an attic had also been a scene of undressing. – Another

dreamer,[1] a man, produced a composite locality out of two places where 'treatments' are carried out: one of them being my consulting room and the other the place of entertainment where he had first made his wife's acquaintance. – A girl dreamt, after her elder brother had promised to give her a feast of caviare, that this same brother's legs were *covered all over with black grains of caviare*. The element of '*contagion*' (in the moral sense) and a recollection of a *rash* in her childhood, which had covered her legs all over with *red* spots, instead of black ones, had been combined with the *grains of caviare* into a new concept – namely the concept of '*what she had got from her brother*'. In this dream, as in others, parts of the human body were treated like objects. – In a dream recorded by Ferenczi [1910*a*],[2] a composite image occurred which was made up from the figure of a *doctor* and of a *horse* and was also dressed
[326] in a *nightshirt*. The element common to these three components was arrived at in the analysis after the woman patient had recognized that the nightshirt was an allusion to her father in a scene from her childhood. In all three cases it was a question of an object of her sexual curiosity. When she was a child she had often been taken by her nurse to a military stud farm where she had ample opportunities of gratifying what was at that time her still uninhibited curiosity.

I have asserted above [p. 283] that dreams have no means of expressing the relation of a contradiction, a contrary or a 'no'. I shall now proceed to give a first denial of this assertion.[3] One class of cases which can be comprised under the heading of 'contraries' are, as we have seen [p. 287], simply represented by identification – cases, that is, in which the idea of an exchange or substitution can be brought into connection with the contrast. I have given a number of instances of this. Another class of contraries in the dream thoughts, falling into a category which may be described as 'contrariwise' or 'just the reverse', find their way into dreams in the following remarkable fashion, which almost deserves to be described as a joke. The 'just the reverse' is not itself represented in the dream content, but reveals its presence in the material through the fact that some piece of the dream content, which has already been constructed and happens (for some other reason) to be adjacent to it, is – as it were by an afterthought [*nachträglich*] – turned round the other way. The process is more easily illustrated than described. In the lovely 'Up

1 [This sentence was added in 1909.]

2 [The remainder of this paragraph was added in 1911.]

3 [Others can be found below on pp. 300 and 388.]

and Down' dream (p. 253 ff.) the representation of the climbing in the dream was the reverse of what it was in its prototype in the dream thoughts – that is, in the introductory scene from Daudet's *Sappho*: in the dream the climbing was difficult at first but easier later, while in the Daudet scene it was easy at first but more and more difficult later. Further, the 'up above' and 'down below' in the dreamer's relation to his brother were represented the other way round in the dream. This pointed to the presence of a reversed or contrary relation between two pieces of the material in the dream thoughts; and we found it in the dreamer's childhood phantasy of being carried by his wet-nurse, which was the reverse of the situation in the novel, where the hero was carrying his mistress. So too in my dream of Goethe's attack on Herr M. (see below, p. 392 ff.) there is a similar 'just the reverse' which has to be put [327]
straight before the dream can be successfully interpreted. In the dream Goethe made an attack on a young man, Herr M.; in the real situation contained in the dream thoughts a man of importance, my friend [Fliess], had been attacked by an unknown young writer. In the dream I based a calculation on the date of Goethe's death; in reality the calculation had been made from the year of the paralytic patient's birth. The thought which turned out to be the decisive one in the dream thoughts was a contradiction of the idea that Goethe should be treated as though he were a lunatic. 'Just the reverse,' said [the underlying meaning of] the dream, 'if you don't understand the book, it's *you* [the critic] that are feeble-minded, and not the author.' I think, moreover, that all these dreams of turning things round the other way include a reference to the contemptuous implications of the idea of 'turning one's back on something'.[1] (E.g. the dreamer's turning round in relation to his brother in the *Sappho* dream [p. 256 f. above].) It is remarkable to observe, moreover,[2] how frequently reversal is employed precisely in dreams arising from repressed homosexual impulses.

Incidentally,[3] reversal, or turning a thing into its opposite, is one of the means of representation most favoured by the dream-work and one which is capable of employment in the most diverse directions. It serves in the first place to give expression to the fulfilment of a wish in reference to some particular element of the dream thoughts. 'If only it had been the other way round!' This is often the best way of expressing the

1 [The German '*Kehrseite*' can mean both 'reverse' and 'backside'. Cf. the vulgar English phrase 'arse upwards' for 'upside down', 'the wrong way round'.]

2 [This sentence was added in 1911.]

3 [This and the next paragraph were added in 1909.]

ego's reaction to a disagreeable fragment of memory. Again, reversal is of quite special use as a help to the censorship, for it produces a mass of distortion in the material which is to be represented, and this has a positively paralysing effect, to begin with, on any attempt at understanding the dream. For that reason, if a dream obstinately declines to reveal its meaning, it is always worthwhile to see the effect of reversing some particular elements in its manifest content, after which the whole situation often becomes immediately clear.

[328] And, apart from the reversal of subject matter, *chronological* reversal must not be overlooked. Quite a common technique of dream distortion consists in representing the outcome of an event or the conclusion of a train of thought at the beginning of a dream and of placing at its end the premises on which the conclusion was based or the causes which led to the event. Anyone who fails to bear in mind this technical method adopted by dream distortion will be quite at a loss when confronted with the task of interpreting a dream.[1]

In some instances, indeed,[2] it is only possible to arrive at the meaning of a dream after one has carried out quite a number of reversals of its content in various respects. For instance, in the case of a young obsessional neurotic, there lay concealed behind one of his dreams the memory of a death wish dating from his childhood and directed against his father, of whom he had been afraid. Here is the text of the dream: *His father was scolding him for coming home so late*. The context in which the dream occurred in the psychoanalytic treatment and the dreamer's associations showed, however, that the original wording must have been that *he* was angry with his *father*, and that in his view his father always came home too *early* (i.e. too soon). He would have preferred it if his father had not come home *at all*, and this was the same

1 [*Footnote added* 1909:] Hysterical attacks sometimes make use of the same kind of chronological reversal in order to disguise their meaning from observers. For instance, a hysterical girl needed to represent something in the nature of a brief romance in one of her attacks – a romance of which she had had a phantasy in her unconscious after an encounter with someone on the suburban railway. She imagined how the man had been attracted by the beauty of her foot and had spoken to her while she was reading; whereupon she had gone off with him and had had a passionate love scene. Her attack *began* with a representation of this love scene by convulsive twitching of her body, accompanied by movements of her lips to represent kissing and tightening of her arms to represent embracing. She then hurried into the next room, sat down on a chair, raised her skirt so as to show her foot, pretended to be reading a book and spoke to me (that is, answered me). [This case is also described by Freud in his paper on hysterical attacks (1909*a*), *RSE*, **9**, 202.] – [*Added* 1914:] Cf. in this connection what Artemidorus says: 'In interpreting the images seen in dreams one must sometimes follow them from the beginning to the end and sometimes from the end to the beginning . . .' [Book I, Chapter XI, Krauss's translation (1881), 20.]

2 [This paragraph was added in 1911.]

thing as a death wish against his father. (See p. 227.) For as a small boy, during his father's temporary absence, he had been guilty of an act of [329] sexual aggression against someone, and as a punishment had been threatened in these words: 'Just you wait till your father comes back!'

If we wish to pursue our study of the relations between dream content and dream thoughts further, the best plan will be to take dreams themselves as our point of departure and consider what certain *formal* characteristics of the method of representation in dreams signify in relation to the thoughts underlying them. Most prominent among these formal characteristics, which cannot fail to impress us in dreams, are the differences in sensory intensity between particular dream images and in the distinctness of particular parts of dreams or of whole dreams as compared with one another.

The differences in intensity between particular dream images cover the whole range extending between a sharpness of definition which we feel inclined, no doubt unjustifiably, to regard as greater than that of reality and an irritating vagueness which we declare characteristic of dreams because it is not completely comparable to any degree of indistinctness which we ever perceive in real objects. Furthermore, we usually describe an impression which we have of an indistinct object in a dream as 'fleeting', while we feel that those dream images which are more distinct have been perceived for a considerable length of time. The question now arises what it is in the material of the dream thoughts that determines these differences in the vividness of particular pieces of the content of a dream.

We must begin by countering certain expectations which almost inevitably present themselves. Since the material of a dream may include real sensations experienced during sleep, it will probably be presumed that these, or the elements in the dream derived from them, are given prominence in the dream content by appearing with special intensity; or, conversely, that whatever is very specially vivid in a dream can be traced back to real sensations during sleep. In my experience, however, this has never been confirmed. It is not the case that the elements of a dream which are derivatives of real impressions during sleep (i.e. of nervous stimuli) are distinguished by their vividness from other elements which arise from memories. The factor of reality counts for nothing in determining the intensity of dream images.

Again, it might be expected that the *sensory* intensity (that is, the [330] vividness) of particular dream images would be related to the *psychical*

intensity of the elements in the dream thoughts corresponding to them. In the latter, psychical intensity coincides with psychical *value*: the most intense elements are also the most important ones – those which form the centre point of the dream thoughts. We know, it is true, that these are precisely elements which, on account of the censorship, cannot as a rule make their way into the content of the dream; nevertheless, it might well be that their immediate derivatives which represent them in the dream might bear a higher degree of intensity, without necessarily on that account forming the centre of the dream. But this expectation too is disappointed by a comparative study of dreams and the material from which they are derived. The intensity of the elements in the one has no relation to the intensity of the elements in the other: the fact is that a complete 'transvaluation of all psychical values' [in Nietzsche's phrase][1] takes place between the material of the dream thoughts and the dream. A direct derivative of what occupies a dominating position in the dream thoughts can often only be discovered precisely in some transitory element of the dream which is quite overshadowed by more powerful images.

The intensity of the elements of a dream turns out to be determined otherwise – and by two independent factors. In the first place, it is easy to see that the elements by which the wish fulfilment is expressed are represented with special intensity. [See p. 502 f. below.] And in the second place, analysis shows that the most vivid elements of a dream are the starting point of the most numerous trains of thought – that the most vivid elements are also those with the most numerous determinants. We shall not be altering the sense of this empirically based assertion if we put it in these terms: the greatest intensity is shown by those elements of a dream on whose formation the greatest amount of condensation has been expended. [Cf. p. 532 f.] We may expect that it will eventually turn out to be possible to express this determinant and the other (namely relation to the wish fulfilment) in a single formula.

The problem with which I have just dealt – the causes of the greater or lesser intensity or clarity of particular elements of a dream – is not to be
[331] confounded with another problem, which relates to the varying clarity of whole dreams or sections of dreams. In the former case clarity is contrasted with vagueness, but in the latter case it is contrasted with confusion. Nevertheless, it cannot be doubted that the increase and decrease of the qualities in the two scales run parallel. A section of a

1 [An allusion to the famous leitmotiv of Nietzsche's attack on Christianity.]

dream which strikes us as perspicuous usually contains intense elements; a dream which is obscure, on the other hand, is composed of elements of small intensity. Yet the problem presented by the scale which runs from what is apparently clear to what is obscure and confused is far more complicated than that of the varying degrees of vividness of dream elements. Indeed, for reasons which will appear later, the former problem cannot yet be discussed. [See p. 448 below.]

In a few cases we find to our surprise that the impression of clarity or indistinctness given by a dream has no connection at all with the make-up of the dream itself but arises from the material of the dream thoughts and is a constituent of it. Thus I remember a dream of mine which struck me when I woke up as being so particularly well constructed, flawless and clear that, while I was still half-dazed with sleep, I thought of introducing a new category of dreams which were not subject to the mechanisms of condensation and displacement but were to be described as 'phantasies during sleep'. Closer examination proved that this rarity among dreams showed the same gaps and flaws in its structure as any other; and for that reason I dropped the category of 'dream phantasies' [*Traumphantasien*].[1] The content of the dream, when it was arrived at, represented me as laying before my friend [Fliess] a difficult and long-sought theory of bisexuality; and the wish-fulfilling power of the dream was responsible for our regarding this theory (which, incidentally, was not given in the dream) as clear and flawless. Thus what I had taken to be a judgement on the completed dream was actually a part, and indeed the essential part, of the dream content. The dream-work had in this case encroached, as it were, upon my first waking thoughts and had conveyed to me as a *judgement* upon the dream the part of the material of the dream thoughts which it had not succeeded in representing accurately in the dream.[2] I once came across a precise counterpart to this in [332]
a woman patient's dream during analysis. To begin with she refused altogether to tell it me, 'because it was so indistinct and muddled'. At length, protesting repeatedly that she felt no certainty that her account was correct, she informed me that several people had come into the dream – she herself, her husband and her father – and that it was as though she had not known whether her husband was her father, or who her father was, or something of that sort. This dream, taken in conjunction with her associations during the analytic session, showed beyond a

1 [*Footnote added* 1930:] Whether rightly I am now uncertain. [Freud argues in favour of there being such a category in some remarks at the end of the discussion of his first example in his paper on 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 199.]

2 [This subject is discussed much more fully below, on p. 397 ff.]

doubt that it was a question of the somewhat commonplace story of a servant girl who was obliged to confess that she was expecting a baby but was in doubts as to 'who the (baby's) father really was'.[1] Thus here again the lack of clarity shown by the dream was a part of the material which instigated the dream: part of this material, that is, was represented in the *form* of the dream. *The form of a dream or the form in which it is dreamt is used with quite surprising frequency for representing its concealed subject matter.*[2]

Glosses on a dream, or apparently innocent comments on it, often serve to disguise a portion of what has been dreamt in the subtlest fashion, though in fact betraying it. For instance, a dreamer remarked that at one point 'the dream had been wiped away'; and the analysis led to an infantile recollection of his listening to someone wiping himself after defaecating. Or here is another example which deserves to be recorded in detail. A young man had a very clear dream which reminded him of some phantasies of his boyhood that had remained conscious. He dreamt that it was evening and that he was in a hotel at a summer resort. He mistook the number of his room and went into one in which an elderly lady and her two daughters were undressing and going to bed. He proceeded: 'Here there are some gaps in the dream; there's something missing. Finally there was a man in the room who tried to throw me out, and I had to have a struggle with him.' He made vain endeav-
[333] ours to recall the gist and drift of the boyish phantasy to which the dream was evidently alluding; until at last the truth emerged that what he was in search of was already in his possession in his remark about the obscure part of the dream. The 'gaps' were the genital apertures of the women who were going to bed; and 'there's something missing' described the principal feature of the female genitalia. When he was young he had had a consuming curiosity to see a woman's genitals and had been inclined to hold to the infantile sexual theory according to which women have male organs.

An analogous recollection of another dreamer assumed a very similar shape.[3] He dreamt as follows: '*I was going into the Volksgarten Restaurant with Fräulein K. . . .*, then came an obscure patch, an interruption . . ., *then I found myself in the salon of a brothel, where I saw two or three women, one of them in her chemise and drawers.*'

1 Her accompanying hysterical symptoms were amenorrhoea and great depression (which was this patient's chief symptom). [This dream is discussed on p. 398 below.]

2 [The last sentence was added in 1909, and from 1914 onwards was printed in spaced type. The next paragraph was added in 1911.]

3 [This and the two following paragraphs were added in 1914.]

ANALYSIS. – Fräulein K. was the daughter of his former chief, and, as he himself admitted, a substitute sister of his own. He had seldom had an opportunity of talking to her, but they once had a conversation in which 'it was just as though we had become aware of our sex, it was as though I were to say: "I'm a man and you're a woman."' He had only once been inside the restaurant in question, with his brother-in-law's sister, a girl who meant nothing at all to him. Another time he had gone with a group of three ladies as far as the entrance of the same restaurant. These ladies were his sister, his sister-in-law and the brother-in-law's sister who has just been mentioned. All of them were highly indifferent to him, but all three fell into the class of 'sister'. He had only seldom visited a brothel – only two or three times in his life.

The interpretation was based on the 'obscure patch' and the 'interruption' in the dream, and put forward the view that in his boyish curiosity he had occasionally, though only seldom, inspected the genitals of a sister who was a few years his junior. Some days later he had a conscious recollection of the misdeed alluded to by the dream.

The content of all dreams that occur during the same night forms part of the same whole; the fact of their being divided into several sections, as well as the grouping and number of those sections – all of this has a [334] meaning and may be regarded as a piece of information arising from the latent dream thoughts.[1] In interpreting dreams consisting of several main sections or, in general, dreams occurring during the same night, the possibility should not be overlooked that separate and successive dreams of this kind may have the same meaning, and may be giving expression to the same impulses in different material. If so, the first of these homologous dreams to occur is often the more distorted and timid, while the succeeding one will be more confident and distinct.

Pharaoh's dreams in the Bible of the kine and the ears of corn, which were interpreted by Joseph, were of this kind. They are reported more fully by Josephus (*Ancient History of the Jews*, Book 2, Chapter 5) than in the Bible. After the King had related his first dream, he said: 'After I had seen this vision, I awaked out of my sleep; and, being in disorder, and considering with myself what this appearance should be, I fell asleep again, and saw another dream, more wonderful than the foregoing, which did more affright and disturb me . . .' After hearing the King's

1 [This sentence was added in 1909. The remainder of this paragraph, and the three following ones, were added in 1911. Freud deals with the subject again towards the end of Lecture XXIX of his *New Introductory Lectures* (1933*a*), *RSE*, **22**, 24–7. It has already been touched upon on p. 279 ff. above, and is mentioned again on pp. 360, 397 *n*. 1 and 469 f. below.]

account of the dream, Joseph replied: 'This dream, O King, although seen under two forms, signifies one and the same event . . .' [Whiston's translation, 1874, **1**, 127–8.]

In his 'Contribution to the Psychology of Rumour', Jung (1910*d*) describes how the disguised erotic dream of a schoolgirl was understood by her schoolfriends without any interpreting and how it was further elaborated and modified. He remarks in connection with one of these dream stories: 'The final thought in a long series of dream images contains precisely what the first image in the series had attempted to portray. The censorship keeps the complex at a distance as long as possible by a succession of fresh symbolic screens, displacements, innocent disguises, etc.' (Ibid., 87.) Scherner (1861, 166) was well acquainted with this peculiarity of the method of representation in dreams and describes it, in connection with his theory of organic stimuli [see p. 75 f. above], as a special law: 'Lastly, however, in all symbolic dream structures which
[335] arise from particular nervous stimuli, the imagination observes a general law: at the beginning of a dream it depicts the object from which the stimulus arises only by the remotest and most inexact allusions, but at the end, when the pictorial effusion has exhausted itself, it nakedly presents the stimulus itself, or, as the case may be, the organ concerned or the function of that organ, and therewith the dream, having designated its actual organic cause, achieves its end. . . .'

Otto Rank (1910*a*) has produced a neat confirmation of this law of Scherner's. A girl's dream reported by him was composed of two separate dreams dreamt, with an interval between them, during the same night, the second of which ended with an orgasm. It was possible to carry out a detailed interpretation of this second dream even without many contributions from the dreamer; and the number of connections between the contents of the two dreams made it possible to see that the first dream represented in a more timid fashion the same thing as the second. So that the second, the dream with the orgasm, helped towards the complete explanation of the first. Rank rightly bases upon this example a discussion of the general significance of dreams of orgasm or emission for the theory of dreaming. [See p. 359 ff. below.]

Nevertheless, in my experience it is only rarely that one is in a position to interpret the clarity or confusion of a dream by the presence of certainty or doubt in its material. Later on I shall have to disclose a factor in dream formation which I have not yet mentioned and which exercises the determining influence upon the scale of these qualities in any particular dream. [See p. 448 f.]

Sometimes, in a dream in which the same situation and setting have persisted for some time, an interruption will occur which is described in these words: 'But then it was as though at the same time it was another place, and there such and such a thing happened.' After a while the main thread of the dream may be resumed, and what interrupted it turns out to be a subordinate clause in the dream material – an interpolated thought. A conditional in the dream thoughts has been represented in the dream by simultaneity: 'if' has become 'when'.

What is the meaning of the sensation of inhibited movement which [336]
appears so commonly in dreams and verges so closely upon anxiety? One tries to move forward but finds oneself glued to the spot, or one tries to reach something but is held up by a series of obstacles. A train is on the point of departure but one is unable to catch it. One raises one's hand to avenge an insult but finds it powerless. And so forth. We have already met with this sensation in dreams of exhibiting [p. 215 ff. above; cf. also p. 254], but have not as yet made any serious attempt to interpret it. An easy but insufficient answer would be to say that motor paralysis prevails in sleep and that we become aware of it in the sensation we are discussing. But it may be asked why in that case we are not perpetually dreaming of these inhibited movements; and it is reasonable to suppose that this sensation, though one which can be summoned up at any moment during sleep, serves to facilitate some particular kind of representation, and is only aroused when the material of the dream thoughts needs to be represented in that way.

This 'not being able to do anything' does not always appear in dreams as a sensation but is sometimes simply a part of the content of the dream. A case of this sort seems to me particularly well qualified to throw light on the meaning of this feature of dreaming. Here is an abridged version of a dream in which I was apparently charged with dishonesty. *The place was a mixture of a private sanatorium and several other institutions. A manservant appeared to summon me to an examination. I knew in the dream that something had been missed and that the examination was due to a suspicion that I had appropriated the missing article.* (The analysis showed that the examination was to be taken in two senses and included a medical examination.) *Conscious of my innocence and of the fact that I held the position of a consultant in the establishment, I accompanied the servant quietly. At the door we were met by another servant, who said, pointing to me: 'Why have you brought him? He's a respectable person.' I then went, unattended, into a large hall, with machines standing in it, which reminded me of an*

Inferno with its hellish instruments of punishment. Stretched out on one apparatus I saw one of my colleagues, who had every reason to take some notice of me; but he paid no attention. I was then told I could go. But I could not find my hat and could not go after all.

The wish fulfilment of the dream evidently lay in my being recognized as an honest man and told I could go. There must therefore have been
[337] all kinds of material in the dream thoughts containing a contradiction of this. That I could go was a sign of my absolution. If therefore something happened at the end of the dream which prevented my going, it seems plausible to suppose that the suppressed material containing the contradiction was making itself felt at that point. My not being able to find my hat meant accordingly: 'After all you're *not* an honest man.' Thus the 'not being able to do something' in this dream was a way of expressing a contradiction – a 'no' –; so that my earlier statement [p. 283 above] that dreams cannot express a 'no' requires correction.[1]

In other dreams, in which the 'not carrying out' of a movement occurs as a *sensation* and not simply as a *situation*, the sensation of the inhibition of a movement gives a more forcible expression to the same contradiction – it expresses a volition which is opposed by a countervolition. Thus the sensation of the inhibition of a movement represents a *conflict of will*. [Cf. p. 218.] We shall learn later [p. 507 f.] that the motor paralysis accompanying sleep is precisely one of the fundamental determinants of the psychical process during dreaming. Now an impulse transmitted along the motor paths is nothing other than a volition, and the fact of our being so certain that we shall feel that impulse inhibited during sleep is what makes the whole process so admirably suited for representing an act of volition and a 'no' which opposes it. It is also easy to see, on my explanation of anxiety [*Angst*], why the sensation of an inhibition of will approximates so closely to anxiety and is so often
[338] linked with it in dreams. Anxiety is a libidinal impulse which has its

1 In the complete analysis there was a reference to an event in my childhood, reached by the following chain of association. 'Der Mohr hat seine Schuldigkeit getan, der Mohr *kann gehen*.' ['The Moor has done his duty, the Moor *can go*.' (Schiller, *Fiesco*, III, 4.) '*Schuldigkeit*' ('duty') is actually a misquotation for '*Arbeit*' ('work').] Then came a facetious conundrum: 'How old was the Moor when he had done his duty?' – 'One year old, because then he could go ["*gehen*" – both "to go" and "to walk"].' (It appears that I came into the world with such a tangle of black hair that my young mother declared I was a little Moor.) – My not being able to find my hat was an occurrence from waking life which was used in more than one sense. Our housemaid, who was a genius at putting things away, had hidden it. – The end of this dream also concealed a rejection of some melancholy thoughts about death: 'I am far from having done my duty, so I must not go yet.' – Birth and death were dealt with in it, just as they had been in the dream of Goethe and the paralytic patient, which I had dreamt a short time before. (See pp. 291, 392 ff. [and 400 f.].)

origin in the unconscious and is inhibited by the preconscious.[1] When, therefore, the sensation of inhibition is linked with anxiety in a dream, it must be a question of an act of volition which was at one time capable of generating libido – that is, it must be a question of a sexual impulse.

I shall deal elsewhere (see below [p. 437 f.]) with the meaning and psychical significance of the judgement which often turns up in dreams expressed in the phrase 'after all this is only a dream'.[2] Here I will merely say in anticipation that it is intended to detract from the importance of what is being dreamt. The interesting and allied problem, as to what is meant when some of the content of a dream is described in the dream itself as 'dreamt' – the enigma of the 'dream within a dream' – has been solved in a similar sense by Stekel [1909, 459 ff.], who has analysed some convincing examples. The intention is, once again, to detract from the importance of what is 'dreamt' in the dream, to rob it of its reality. What is dreamt in a dream after waking from the 'dream within a dream' is what the dream wish seeks to put in the place of an obliterated reality. It is safe to suppose, therefore, that what has been 'dreamt' in the dream is a representation of the reality, the true recollection, while the continuation of the dream, on the contrary, merely represents what the dreamer wishes. To include something in a 'dream within a dream' is thus equivalent to wishing that the thing described as a dream had never happened. In other words,[3] if a particular event is inserted into a dream as a dream by the dream-work itself, this implies the most decided confirmation of the reality of the event – the strongest *affirmation* of it. The dream-work makes use of dreaming as a form of repudiation, and so confirms the discovery that dreams are wish fulfilments.[4]

1 [*Footnote added* 1930:] In the light of later knowledge this statement can no longer stand. [Cf. p. 143 *n.* 2 above. See also p. 447 *n.* below.]

2 [This paragraph (except for its penultimate sentence and part of its last sentence) was added in 1911.]

3 [This sentence was added in 1919.]

(D)
CONSIDERATIONS OF REPRESENTABILITY

We have been occupied so far with investigating the means by which dreams represent the relations between the dream thoughts. In the course of this investigation, however, we have more than once touched upon the further topic of the general nature of the modifications which the material of the dream thoughts undergoes for the purpose of the formation of a dream. We have learnt that that material, stripped to a large extent of its relations, is submitted to a process of compression,[1] while at the same time displacements of intensity between its elements necessarily bring about a psychical transvaluation of the material. The displacements we have hitherto considered turned out to consist in the replacing of some one particular idea [*Vorstellung*][T] with another in some way closely associated with it, and they were used to facilitate condensation insofar as, by their means, instead of *two* elements, a single common element intermediate between them found its way into the dream. We have not yet referred to any other sort of displacement. Analyses show us, however, that another sort exists and that it reveals itself in a change in the *verbal expression* of the thoughts concerned. In both cases there is a displacement along a chain of associations; but a process of such a kind can occur in various psychical spheres, and the outcome of the displacement may in one case be that one element is replaced with another, while the outcome in another case may be that a single element has its *verbal form* replaced with another. [339]

This second species of displacement which occurs in dream formation is not only of great theoretical interest but is also specially well calculated to explain the appearance of fantastic absurdity in which dreams are disguised. The direction taken by the displacement usually

1 [See the discussion of the translation of *Verdichtung* in *RSE*, **24**, 90. Freud's use of the word *Kompression* here makes quite clear his understanding of the process.]

results in a colourless and abstract expression in the dream thought being exchanged for a pictorial and concrete one. The advantage, and accordingly the purpose, of such a change jumps to the eyes. A thing
[340] that is pictorial is, from the point of view of a dream, a thing that is *capable of being represented*: it can be introduced into a situation in which abstract expressions offer the same kind of difficulties to representation in dreams as a political leading article in a newspaper would offer to an illustrator. But not only representability, but the interests of condensation and the censorship as well, can be the gainers from this exchange. A dream thought is unusable so long as it is expressed in an abstract form; but when once it has been transformed into pictorial language, contrasts and identifications of the kind which the dream-work requires, and which it creates if they are not already present, can be established more easily than before between the new form of expression and the remainder of the material underlying the dream. This is so because in every language concrete terms, in consequence of the history of their development, are richer in associations than conceptual ones. We may suppose that a good part of the intermediate work done during the formation of a dream, which seeks to reduce the dispersed dream thoughts to the most succinct and unified expression possible, proceeds along the line of finding appropriate verbal transformations for the individual thoughts. Any one thought, whose form of expression may happen to be fixed for other reasons, will operate in a determinant and selective manner on the possible forms of expression allotted to the other thoughts, and it may do so, perhaps, from the very start – as is the case in writing a poem. If a poem is to be written in rhymes, the second line of a couplet is limited by two conditions: it must express an appropriate meaning, and the expression of that meaning must rhyme with the first line. No doubt the best poem will be one in which we fail to notice the intention of finding a rhyme, and in which the two thoughts have, by mutual influence, chosen from the very start a verbal expression which will allow a rhyme to emerge with only slight subsequent adjustment.

In a few instances a change of expression of this kind assists dream condensation even more directly, by finding a form of words which owing to its ambiguity is able to give expression to more than one of the dream thoughts. In this way the whole domain of verbal wit is put at the disposal of the dream-work. There is no need to be astonished at the part played by words in dream formation. Words, since they are the nodal points of numerous ideas, may be regarded as predestined

to ambiguity; and the neuroses (e.g. in framing obsessions and phobias), no less than dreams, make unashamed use of the advantages thus offered by words for purposes of condensation and disguise.[1] It is easy to show that dream distortion too profits from displacement of expression. If one ambiguous word is used instead of two unambiguous ones the result is misleading; and if our everyday, sober method of expression is replaced by a pictorial one, our understanding is brought to a halt, particularly since a dream never tells us whether its elements are to be interpreted literally or in a figurative sense or whether they are to be connected with the material of the dream thoughts directly or through the intermediary of some interpolated phraseology.[2] In interpreting any dream element it is in general doubtful [341]

(*a*) whether it is to be taken in a positive or negative sense (as an antithetic relation),

(*b*) whether it is to be interpreted historically (as a recollection),

(*c*) whether it is to be interpreted symbolically, or

(*d*) whether its interpretation is to depend on its wording. Yet, in spite of all this ambiguity, it is fair to say that the productions of the dream-work, which, it must be remembered, *are not made with the intention of being understood*, present no greater difficulties to their translators than do the ancient hieroglyphic scripts[t] to those who seek to read them.

I have already given several examples of representations in dreams which are only held together by the ambiguity of their wording. (For instance, 'She opened her mouth properly' in the dream of Irma's injection [p. 99 above] and 'I could not go after all' in the dream which I last quoted [p. 299 f. below].) I will now record a dream in which a considerable part was played by the turning of abstract thought into pictures. The distinction between dream interpretation of this kind and interpretation by means of symbolism can still be drawn quite sharply. In the case of symbolic dream interpretation the key to the symbolization is arbitrarily chosen by the interpreter; whereas in our cases of verbal disguise the keys are generally known and laid down by firmly established linguistic usage. If one has the right idea at one's disposal at the [342]

1 [*Footnote added* 1909:] See my volume on *Jokes* (1905*c*) [especially the later part of Chapter VI] and the use of 'verbal bridges' in the solution of neurotic symptoms. [See, e.g., the synthesis of 'Dora's' first dream at the end of Section II of Freud, 1905*e*; *RSE*, **7**, 78 ff. (where the term 'switch-words' is also used), and the solution of the 'Rat Man's' rat obsession in Section I (G) of Freud, 1909*d*; ibid., **10**, 153 ff.]

2 [The remainder of this paragraph was added as a footnote in 1909 and included in the text in 1914.]

right moment, one can solve dreams of this kind wholly or in part even independently of information from the dreamer.

A lady of my acquaintance had the following dream: *She was at the opera. A Wagner opera was being performed, and had lasted till a quarter to eight in the morning. There were tables set out in the stalls, at which people were eating and drinking. Her cousin, who had just got back from his honeymoon, was sitting at one of the tables with his young wife, and an aristocrat was sitting beside them. Her cousin's wife, so it appeared, had brought him back with her from the honeymoon, quite openly, just as one might bring back a hat. In the middle of the stalls there was a high tower, which had a platform on top of it surrounded by an iron railing. High up at the top was the conductor, who had the features of Hans Richter. He kept running round the railing, and was perspiring violently; and from that position he was conducting the orchestra, which was grouped about the base of the tower. She herself was sitting in a box with a woman friend* (whom I knew). *Her younger sister wanted to hand her up a large lump of coal from the stalls, on the ground that she had not known it would be so long, and must be simply freezing by now. (As though the boxes <u>needed</u> to be heated during the long performance.)*

Even though the dream was well focused on a single situation, yet in other respects it was sufficiently senseless: the tower in the middle of the stalls, for instance, with the conductor directing the orchestra from the top of it! And above all the coal that her sister handed up to her! I deliberately refrained from asking for an analysis of the dream. But since I had some knowledge of the dreamer's personal relations, I was able to interpret certain pieces of it independently of her. I knew she had had a great deal of sympathy for a musician whose career had been prematurely cut short by insanity. So I decided to take the tower in the stalls metaphorically. It then emerged that the man whom she had wanted to see in Hans Richter's place *towered high above* the other members of the orchestra. The tower might be described as a composite picture formed by apposition. The lower part of its structure represented the man's greatness; the railing at the top, behind which
[343] he was running round like a prisoner or an animal in a cage – this was an allusion to the unhappy man's name[1] – represented his ultimate fate. The two ideas might have been brought together in the word '*Narrenturm*'.[2]

1 [*Footnote added* 1925:] Hugo Wolf.

2 [Literally 'Fools' Tower' – an old term for an insane asylum.]

Having thus discovered the mode of representation adopted by the dream, we might attempt to use the same key for solving its second apparent absurdity – the coal handed up to the dreamer by her sister. 'Coal' must mean 'secret love':

> Kein *Feuer*, keine *Kohle*
> kann brennen so heiss
> als wie *heimliche Liebe*,
> von der niemand nichts weiss.[1]

She herself and her woman friend had been left unmarried [German '*sitzen geblieben*', literally 'left sitting']. Her younger sister, who still had prospects of marriage, handed her up the coal 'because she had not known *it would be so long*'. The dream did not specify *what* would be so long. If it were a story, we should say 'the performance'; but since it is a dream, we may take the phrase as an independent entity, decide that it was used ambiguously and add the words 'before she got married'. Our interpretation of 'secret love' is further supported by the mention of the dreamer's cousin sitting with his wife in the stalls, and by the *open* love affair attributed to the latter. The dream was dominated by the antithesis between secret and open love and between the dreamer's own fire and the coldness of the young wife. In both cases, moreover, there was someone 'highly placed' – a term applying equally to the aristocrat and to the musician on whom such high hopes had been pinned.[2]

The foregoing discussion has led us at last to the discovery of a third factor[3] whose share in the transformation of the dream thoughts into [344] the dream content is not to be underrated: namely, *considerations of representability in the peculiar psychical material of which dreams make use* – for the most part, that is, representability in visual images. Of the various subsidiary thoughts attached to the essential dream thoughts, those will be preferred which admit of visual representation; and the dream-work does not shrink from the effort of recasting unadaptable thoughts into a new verbal form – even into a less usual one – provided that that process facilitates representation and so relieves the

1 [A German *Volkslied*.

> No *fire*, no *coal*
> So hotly glows
> As *secret love*
> Of which no-one knows.]

2 [The element of absurdity in this dream is commented upon on p. 388 below.]

3 [The two previous ones being condensation and displacement.]

psychological pressure caused by constricted thinking. This pouring of the content of a thought into another mould may at the same time serve the purposes of the activity of condensation and may create connections, which might not otherwise have been present, with some other thought; while this second thought itself may already have had its original form of expression changed, with a view to meeting the first one halfway.

Herbert Silberer (1909)[1] has pointed out a good way of directly observing the transformation of thoughts into pictures in the process of forming dreams and so of studying this one factor of the dream-work in isolation. If, when he was in a fatigued and sleepy condition, he set himself some intellectual task, he found that it often happened that the thought escaped him and that in its place a picture appeared, which he was then able to recognize as a substitute for the thought. Silberer describes these substitutes by the not very appropriate term of 'autosymbolic'. I will here quote a few examples from Silberer's paper [ibid., 519–22], and I shall have occasion, on account of certain characteristics of the phenomena concerned, to return to them later. [See p. 450 ff. below.]

'*Example* 1. – I thought of having to revise an uneven passage in an essay.

'*Symbol*. – I saw myself planing a piece of wood.'

'*Example* 5. – I endeavoured to bring home to myself the aim of certain metaphysical studies which I was proposing to make. Their aim, I reflected, was to work one's way through to ever higher forms of consciousness and layers of existence, in one's search for the bases of existence.

[345] '*Symbol*. – I was pushing a long knife under a cake, as though to lift out a slice.

'*Interpretation*. – My motion with the knife meant the "working my way through" which was in question. . . . Here is the explanation of the symbolism. It is from time to time my business at meals to cut up a cake and distribute the helpings. I perform the task with a long, flexible knife – which demands some care. In particular, to lift out the slices cleanly after they have been cut offers certain difficulties; the knife must be pushed carefully *under* the slice (corresponding to the slow "working my way through" to reach the "bases"). But there is yet more symbolism in the picture. For the cake in the symbol was a "Dobos" cake – a cake

1 [This paragraph and the subsequent quotation from Silberer were added in 1914.]

with a number of "layers" through which, in cutting it, the knife has to penetrate (the "layers" of consciousness and thought).'

'*Example* 9. – I had lost the thread in a train of thought. I tried to find it again, but had to admit that the starting point had completely escaped me.

'*Symbol*. – Part of a compositor's forme, with the last lines of type fallen away.'

In view of the part played by jokes, quotations, songs and proverbs in the mental life of educated people, it would fully agree with our expectations if disguises of such kinds were used with extreme frequency for representing dream thoughts. What, for instance, is the meaning in a dream of a number of carts, each filled with a different sort of vegetable? They stand for a wishful contrast to '*Kraut und Rüben*' [literally 'cabbages and turnips'], that is to say to 'higgledy-piggledy', and accordingly signify 'disorder'. I am surprised that this dream has only been reported to me once.[1] A dream symbolism of universal validity has only emerged in the case of a few subjects, on the basis of generally familiar allusions and verbal substitutes. Moreover, a good part of this symbolism is shared by dreams with psychoneuroses, legends and popular customs.[2]

Indeed, when we look into the matter more closely, we must recognize the fact that the dream-work is doing nothing original in making [346]
substitutions of this kind. In order to gain its ends – in this case the possibility of a representation unhampered by censorship – it merely follows the paths which it finds already laid down in the unconscious; and it gives preference to those transformations of the repressed material which can also become conscious in the form of jokes or allusions and of which the phantasies of neurotic patients are so full. At this point we suddenly reach an understanding of Scherner's dream interpretations, whose essential correctness I have defended elsewhere [pp. 73 ff. and 201 above]. The imagination's preoccupation with the subject's own body is by no means peculiar to dreams or characteristic only of them. My analyses have shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the other sex, and to those of their own as well. Nor, as Scherner [1861] and Volkelt [1875] have rightly insisted, is a house the

1 [*Footnote added* 1925:] I have in fact never met with this image again; so I have lost confidence in the correctness of the interpretation.

2 [The subject of dream symbolism is treated at length in the next section.]

only circle of ideas employed for symbolizing the body; and this is equally true of dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far beyond the sphere of the external genitalia.) For these patients pillars and columns represent the legs (as they do in the *Song of Solomon*), every gateway stands for one of the bodily orifices (a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of ideas centring round plant life or the kitchen may just as readily be chosen to conceal sexual images.[1] In the former case the way has been well prepared by linguistic usage, itself the precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the seed and the maiden's garden in the *Song of Solomon*. The ugliest as well as the most intimate details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual symbolism can find its best hiding place behind what is commonplace and inconspicuous. There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or his nausea at the sight of eggs or macaroni, and behind the
[347] enormous exaggeration in neurotics of the natural human dread of snakes. Wherever neuroses make use of such disguises they are following paths along which all humanity passed in the earliest periods of
Kultur civilization [*Kulturperioden*][T] – paths of whose continued existence today, under the thinnest of veils, evidence is to be found in linguistic usages, superstitions and customs.

I will now append the 'flowery' dream dreamt by one of my women patients which I have already [p. 280 f. above] promised to record. I have indicated in small capitals those elements in it that are to be given a sexual interpretation. The dreamer quite lost her liking for this pretty dream after it had been interpreted.

(*a*) INTRODUCTORY DREAM: *She went into the kitchen, where her two maidservants were, and found fault with them for not having got her 'bite of food' ready. At the same time she saw quite a quantity of crockery standing upside down to drain, common crockery piled up in heaps.* Later addition: *The two maidservants went to fetch some water and had to step into a kind of river which came right up to the house or into the yard.*[2]

1 [*Footnote added* 1914:] Abundant evidence of this is to be found in the three supplementary volumes to Fuchs (1909–12).

2 For the interpretation of this introductory dream, which is to be interpreted as a causal dependent clause, see p. 281 above. [Cf. also pp. 284 and 289.]

(*b*) MAIN DREAM:[1] *She was descending from a height*[2] *over some strangely constructed palisades or fences, which were put together into large panels, and consisted of small squares of wattling.*[3] *It was not intended for climbing over; she had trouble in finding a place to put her feet in and felt glad that her dress had not been caught anywhere, so that she had stayed respectable as she went along.*[4] *She was holding a* BIG BRANCH *in her hand;*[5] *actually it was like a tree, covered over with* RED BLOSSOMS, *branching and spreading out.*[6] *There was an idea of their being cherry* BLOSSOMS; *but they also looked like double* CAMELLIAS, *though, of course, those do not grow on trees. As she went down, first she had* ONE, *then suddenly* TWO, *and later again* ONE.[7] *When she got down, the lower* BLOSSOMS *were already a good deal* FADED. *Then she saw, after she had got down, a manservant who – she felt inclined to say – was combing a similar tree, that is to say he was using a* PIECE OF WOOD *to drag out some* THICK TUFTS OF HAIR *that were hanging down from it like moss. Some other workmen had cut down similar* BRANCHES *from a* GARDEN *and thrown them into the* ROAD, *where they* LAY ABOUT, *so that* A LOT OF PEOPLE TOOK SOME. *But she asked whether that was all right – whether she might* TAKE ONE TOO.[8] *A young* MAN (someone she knew, a stranger) *was standing in the garden; she went up to him to ask how* BRANCHES *of that kind could be* TRANSPLANTED INTO HER OWN GARDEN.[9] *He embraced her; whereupon she struggled and asked him what he was thinking of and whether he thought people could embrace her like that. He said that there was no harm in that: it was allowed.*[10] *He then said he was willing to go into the* OTHER GARDEN *with her, to show her how the planting was* [348]

1 Describing the course of her life.

2 Her high descent: a wishful antithesis to the introductory dream.

3 A composite picture uniting two localities: what were known as the 'attics' of her family home, where she used to play with her brother, the object of her later phantasies, and a farm belonging to a bad uncle who used to tease her.

4 A wishful antithesis to a real recollection of her uncle's farm, where she used to throw off her clothes in her sleep.

5 Just as the angel carries a sprig of lilies in pictures of the Annunciation.

6 For the explanation of this composite image see p. 284: innocence, menstruation, *La dame aux camélias*.

7 Referring to the multiplicity of the people involved in her phantasy.

8 That is whether she might pull one down, i.e. masturbate. ['*Sich einen herunterreissen*' or '*ausreissen*' (literally 'to pull one down' or 'out') are vulgar German terms equivalent to the English 'to toss oneself off'. Freud had already drawn attention to this symbolism at the end of his paper on 'Screen Memories' (1899*a*), *RSE*, **3**, 309; see also below, p. 347 ff.]

9 The branch had long since come to stand for the male genital organ; incidentally it also made a plain allusion to her family name.

10 This, as well as what next follows, related to marriage precautions.

done, and added something she could not quite understand: 'Anyhow, I need three YARDS *(*later she gave it as: *three square yards) or three fathoms of ground.' It was as though he were asking her for something in return for his willingness, as though he intended* TO COMPENSATE HIMSELF IN HER GARDEN, *or as though he wanted to* CHEAT *some law or other, to get some advantage from it without causing her harm. Whether he really showed her something, she had no idea.*

This dream, which I have brought forward on account of its symbolic elements, may be described as a 'biographical' one. Dreams of this kind occur frequently during psychoanalysis, but perhaps only rarely outside it.[1]

[349] I naturally have at my disposal[2] a superfluity of material of this kind, but to report it would involve us too deeply in a consideration of neurotic conditions. It all leads to the same conclusion, namely that there is no necessity to assume that any peculiar symbolizing activity of the mind is operating in the dream-work, but that dreams make use of any symbolizations which are already present in unconscious thinking, because they fit in better with the requirements of dream construction on account of their representability and also because as a rule they escape censorship.

1 [This paragraph was added in 1925. – *Footnote added* (to the preceding paragraph) 1911:] A similar 'biographical' dream can be found below as the third of my examples of dream symbolism [p. 325]. Another one has been recorded at length by Rank [1910*a*], and another, which must be read 'in reverse', by Stekel (1909, 486). – [A reference to 'biographical' dreams can be found near the end of Freud's 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 57.]

2 [In the first three editions, 1900, 1909 and 1911, this paragraph was preceded by another, which was omitted from 1914 onwards. The deleted paragraph ran as follows: 'I must mention another circle of ideas which often serves as a disguise for sexual material both in dreams and in neuroses: namely ideas connected with changing house. "Changing house" may easily be replaced by the word "*Ausziehen*" [meaning both "moving house" and "undressing"], and is thus connected with the subject of "clothing". If there is also a lift or elevator in the dream, we shall be reminded of the English word "to lift", that is, "to lift one's clothes".']

(E)
REPRESENTATION BY SYMBOLS IN DREAMS – SOME FURTHER TYPICAL DREAMS[1]

The analysis of this last, biographical, dream is clear evidence that I recognized the presence of symbolism in dreams from the very beginning. But it was only by degrees and as my experience increased that I arrived at a full appreciation of its extent and significance, and I did so under the influence of the contributions of Wilhelm Stekel (1911*a*), about whom a few words will not be out of place here. [1925.] [350]

That writer, who has perhaps damaged psychoanalysis as much as he has benefited it, brought forward a large number of unsuspected translations of symbols; to begin with they were met with scepticism, but later they were for the most part confirmed and had to be accepted. I shall not be belittling the value of Stekel's services if I add that the sceptical reserve with which his proposals were received was not without justification. For the examples by which he supported his interpretations were often unconvincing, and he made use of a method which must be rejected as scientifically untrustworthy. Stekel arrived at his interpretations of symbols by way of intuition, thanks to a peculiar gift for the direct understanding of them. But the existence of such a gift cannot be counted upon generally, its effectiveness is exempt from all criticism and consequently its findings have no claim to credibility. It is as though one sought to base the diagnosis of infectious diseases upon olfactory impressions received at the patient's bedside – though there have undoubtedly been clinicians who could accomplish more than other people by means of the sense of smell (which is usually atrophied) and were really able to diagnose a case of enteric fever by smell. [1925.] [351]

Advances in psychoanalytic experience have brought to our notice patients who have shown a direct understanding of dream symbolism of this kind to a surprising extent. They were often sufferers from

1 [With the exception of two paragraphs (on p. 351 f. below), none of Section E of this chapter appeared in the first edition of the book. As explained in the Editors' Introduction (p. xvi f. above), much of the material was added in the 1909 and 1911 editions, but in them it was included in Chapter V under the heading of 'Typical Dreams' (Section D of that chapter). In the edition of 1914, the present section was first constituted, partly from the material previously added to Chapter V and partly from further new material. Still more material was added in subsequent editions. In view of these complications, in this section a date has been added in square brackets at the end of each paragraph. It will be understood from what has been said that material dated 1909 and 1911 originally appeared in Chapter V and was transferred to its present position in 1914.]

dementia praecox, so that for a time there was an inclination to suspect every dreamer who had this grasp of symbols of being a victim of that disease.[1] But such is not the case. It is a question of a personal gift or peculiarity which has no visible pathological significance. [1925.]

When we have become familiar with the abundant use made of symbolism for representing sexual material in dreams, the question is bound to arise of whether many of these symbols do not occur with a permanently fixed meaning, like the 'grammalogues' in shorthand; and we shall feel tempted to draw up a new 'dream book' on the decoding principle [see p. 87 f. above]. On that point there is this to be said: this symbolism is not peculiar to dreams, but is characteristic of unconscious ideation, in particular among the people, and it is to be found in folklore, and in popular myths, legends, linguistic idioms, proverbial wisdom and current jokes, to a more complete extent than in dreams. [1909.]

It would therefore carry us far beyond the sphere of dream interpretation if we were to do justice to the significance of symbols and discuss the numerous, and to a large extent still unsolved, problems attaching to the concept of a symbol.[2] We must restrict ourselves here to remarking that representation by a symbol is among the indirect methods of representation, but that all kinds of indications warn us against lumping it in with other forms of indirect representation without being able to
[352] form any clear conceptual picture of their distinguishing features. In a number of cases the element in common between a symbol and what it represents is obvious; in others it is concealed and the choice of the symbol seems puzzling. It is precisely these latter cases which must be able to throw light upon the ultimate meaning of the symbolic relation, and they indicate that it is of a genetic character. Things that are symbolically connected today were probably united in prehistoric times by conceptual and linguistic identity.[3] The symbolic relation seems to be a relic and a mark of former identity. In this connection we may observe how in a number of cases the use of a common symbol extends further than the use of a common language, as was already pointed out by

1 [Freud remarks elsewhere (1913*a*), *RSE*, **12**, that, just as the presence of dementia praecox facilitates the interpretation of symbols, so an obsessional neurosis makes it more difficult.]

2 [*Footnote added* 1911:] Cf. the works of Bleuler [1910*a*] and of his Zürich pupils, Maeder [1908*a*], Abraham [1909], etc., on symbolism, and the non-medical writers to whom they refer (Kleinpaul [1898], etc.). [*Added* 1914:] What is most to the point on this subject can be found in Rank & Sachs (1913, Chapter I). [*Added* 1925:] See further Jones (1916*a*).

3 [*Footnote added* 1925:] This view would be powerfully supported by a theory put forward by Dr Hans Sperber (1912). He is of the opinion that all primal words referred to sexual things but afterwards lost their sexual meaning through being applied to other things and activities which were compared with the sexual ones.

Schubert (1814).[1] A number of symbols are as old as language itself, while others (e.g. 'airship', 'Zeppelin') are being coined continuously down to the present time. [1914.]

Dreams make use of this symbolism for the disguised representation of their latent thoughts. Incidentally, many of the symbols are habitually or almost habitually employed to express the same thing. Nevertheless, the peculiar plasticity of the psychical material [in dreams] must never be forgotten. Often enough a symbol has to be interpreted in its proper meaning and not symbolically; while on other occasions a dreamer may derive from his private memories the power to employ as sexual symbols all kinds of things which are not ordinarily employed as such.[2] If a dreamer has a choice open to him between a number of symbols, he will decide in favour of the one which is connected in its subject matter with [353] the rest of the material of his thoughts – which, that is to say, has individual grounds for its acceptance in addition to the typical ones. [1909; last sentence 1914.]

Though the later investigations since the time of Scherner have made it impossible to dispute the existence of dream symbolism – even Havelock Ellis [1911*a*, 109] admits that there can be no doubt that our dreams are full of symbolism – yet it must be confessed that the presence of symbols in dreams not only facilitates their interpretation but also makes it more difficult. As a rule the technique of interpreting according to the dreamer's free associations [*Assoziationen*][T] leaves us in the lurch when we come to the symbolic elements in the dream content. Regard for scientific criticism forbids our returning to the arbitrary judgement of the dream interpreter, as it was employed in ancient times and seems to have been revived in the reckless interpretations of Stekel. We are thus obliged, in dealing with those elements of the dream content which must be recognized as symbolic, to adopt a combined technique, which, on the one hand, rests on the dreamer's associations and, on the other hand, fills the gaps from the interpreter's knowledge of symbols. We must combine a critical caution in resolving symbols with a careful study of them in dreams which afford particularly clear instances of their use, in order to disarm any charge of arbitrariness in dream interpretation.

1 [This last clause was added in 1919. – *Footnote added* 1914:] For instance, according to Ferenczi [see Rank, 1912*d*, 100], a ship moving on the water occurs in dreams of micturition in Hungarian dreamers, though the term '*schiffen*' ['to ship'; cf. vulgar English 'to pumpship'] is unknown in that language. (See also p. 328 f. below.) In dreams of speakers of French and other Romance languages a room is used to symbolize a woman, though these languages have nothing akin to the German expression '*Frauenzimmer*'. [See p. 190 *n.* 1 above.]

2 [In the editions of 1909 and 1911 only, the following sentence appeared at this point: 'Moreover the ordinarily used sexual symbols are not invariably unambiguous.']

The uncertainties which still attach to our activities as interpreters of dreams spring in part from our incomplete knowledge, which can be progressively improved as we advance further, but in part from certain characteristics of dream symbols themselves. They frequently have more than one or even several meanings, and, as with Chinese script, the correct interpretation can only be arrived at on each occasion from the context. This ambiguity of the symbols links up with the characteristic of dreams for admitting of 'overinterpretation' [see p. 248 above] – for representing in a single piece of content thoughts and wishes which are often widely divergent in their nature. [1914.]

Subject to these qualifications and reservations I will now proceed. The emperor and empress (or the king and queen) as a rule really represent the dreamer's parents; and a prince or princess represents the dreamer
[354] himself or herself. [1909.] But the same high authority is attributed to great men as to the emperor; and for that reason Goethe, for instance, appears as a father symbol in some dreams (Hitschmann, 1913*c*). [1919.] – All elongated objects, such as sticks, tree-trunks and umbrellas (the opening of these last being comparable to an erection) may stand for the male organ [1909] – as well as all long, sharp weapons, such as knives, daggers and pikes [1911]. Another frequent though not entirely intelligible symbol of the same thing is a nail-file – possibly on account of the rubbing up and down. [1909.] – Boxes, cases, chests, cupboards and ovens represent the uterus [*Mutterleib*] [1909], and also hollow objects, ships and vessels of all kinds [1919]. – Rooms in dreams are usually women ('*Frauenzimmer*' [see p. 190 *n.* 1 above]); if the various ways in and out of them are represented, this interpretation is scarcely open to doubt. [1909.][1] In this connection interest in whether the room is open or locked is easily intelligible. (Cf. Dora's first dream in my 'Fragment of an Analysis of a Case of Hysteria', 1905*e* [*RSE*, 7, 59 *n.* 4].) There is no need to name explicitly the key that unlocks the room; in his ballad of Count Eberstein, Uhland has used the symbolism of locks and keys to construct a charming piece of bawdry. [1911.] – A dream of going

1 [*Footnote added* 1919:] 'One of my patients, who was living in a boarding house, dreamt that *he met one of the maidservants and asked her what her number was. To his surprise she answered:* "*14*". He had in fact started a liaison with this girl and had paid several visits to her in her bedroom. She had not unnaturally been afraid that the landlady might become suspicious, and, on the day before the dream, she had proposed that they should meet in an unoccupied room. This room was actually "No. 14", while in the dream it was the woman herself who bore this number. It would hardly be possible to imagine clearer proof of an identification between a woman and a room.' (Jones, 1914*a*.) Cf. Artemidorus, *Oneirocritica* [Book II, Chapter X]: 'Thus, for instance, a bedchamber stands for a wife, if such there be in the house.' (Trans. F. S. Krauss, 1881, 110.)

through a suite of rooms is a brothel or harem dream. [1909.] But, as Sachs [1914] has shown by some neat examples, it can also be used (by antithesis) to represent marriage. [1914.] – We find an interesting link with the sexual researches of childhood when a dreamer dreams of two rooms which were originally one, or when he sees a familiar room divided into two in the dream, or *vice versa*. In childhood the female genitals and the anus are regarded as a single area – the 'bottom' (in [355] accordance with the infantile 'cloaca theory');[1] and it is not until later that the discovery is made that this region of the body comprises two separate cavities and orifices. [1919.] – Steps, ladders or staircases, or, as the case may be, walking up or down them, are representations of the sexual act.[2] – Smooth walls over which the dreamer climbs, the façades of houses, down which he lowers himself – often in great anxiety – correspond to erect human bodies, and are probably repeating in the dream recollections of a baby's climbing up his parents or nurse. The 'smooth' walls are men; in his fear the dreamer often clutches hold of 'projections' in the façades of houses. [1911.] – Tables, tables laid for a meal, and boards also stand for women – no doubt by antithesis, since the contours of their bodies are eliminated in the symbols. [1909.] 'Wood' seems, from its linguistic connections, to stand in general for female 'material'. The name of the island of 'Madeira' means 'wood' in Portuguese. [1911.] Since 'bed and board' constitute marriage, the latter often takes the place of the former in dreams and the sexual complex of ideas is, so far as may be, transposed on to the eating complex. [1909.] – As regards articles of clothing, a woman's hat can very often be interpreted with certainty as a genital organ, and, moreover, as a *man's*. The same is true [356] of an overcoat or cloak [German '*Mantel*'], though in this case it is not

1 [See the section on 'Theories of Birth' in the second of Freud's *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 173.]

2 [*Footnote added* 1911:] I will repeat here what I have written on this subject elsewhere (Freud, 1910*d*): 'A little time ago I heard that a psychologist whose views are somewhat different from ours had remarked to one of us that, when all was said and done, we did undoubtedly exaggerate the hidden sexual significance of dreams: his own commonest dream was of going upstairs, and surely there could not be anything sexual in *that*. We were put on the alert by this objection, and began to turn our attention to the appearance of steps, staircases and ladders in dreams, and were soon in a position to show that staircases (and analogous things) were unquestionably symbols of copulation. It is not hard to discover the basis of the comparison: we come to the top in a series of rhythmical movements and with increasing breathlessness and then, with a few rapid leaps, we can get to the bottom again. Thus the rhythmical pattern of copulation is reproduced in going upstairs. Nor must we omit to bring in the evidence of linguistic usage. It shows us that "mounting" [German "*steigen*"] is used as a direct equivalent for the sexual act. We speak of a man as a "*Steiger*" [a "mounter"] and of "*nachsteigen*" ["to run after", literally "to climb after"]. In French the steps on a staircase are called "*marches*" and "*un vieux marcheur*" has the same meaning as our "*ein alter Steiger*" ["an old rake"].' [Cf. also p. 253 ff. above.]

clear to what extent the use of the symbol is due to a verbal assonance.[1] In men's dreams a necktie often appears as a symbol for the penis. No doubt this is not only because neckties are long, dependent objects and peculiar to men, but also because they can be chosen according to taste – a liberty which, in the case of the object symbolized, is forbidden by Nature.[2] Men who make use of this symbol in dreams are often very extravagant in ties in real life and own whole collections of them. [1911.] – It is highly probable that all complicated machinery and apparatus occurring in dreams stand for the genitals (and as a rule male ones [1919]) – in describing which dream symbolism is as indefatigable as the 'joke-work'.[3] [1909.] Nor is there any doubt that all weapons and tools are used as symbols for the male organ: e.g. ploughs, hammers, rifles, revolvers, daggers, sabres, etc. [1919.] – In the same way many landscapes in dreams, especially any containing bridges or wooded hills, may clearly be recognized as descriptions of the genitals. [1911.] Marcinowski [1912*a*] has published a collection of dreams illustrated by their dreamers with drawings that ostensibly represent landscapes and other localities occurring in the dreams. These drawings bring out very clearly the distinction between a dream's manifest and latent meaning. Whereas to the innocent eye they appear as plans, maps, and so on, closer inspection shows that they represent the human body, the genitals, etc., and only then do the dreams become intelligible. (See in this connection Pfister's papers [1911–12 and 1913*a*] on cryptograms and puzzle pictures.) [1914.] In the case of unintelligible neologisms, too, it is worth considering whether they may not be put together from components with a sexual meaning. [1911.] – Children in dreams often stand [357] for the genitals; and, indeed, both men and women are in the habit of referring to their genitals affectionately as their 'little ones'. [1909.] Stekel [1909, 473] is right in recognizing a 'little brother' as the penis. [1925.] Playing with a little child, beating it, etc., often represent masturbation in dreams. [1911.] – To represent castration symbolically, the

1 [Cf. the further comment on this symbol in Lecture XXIX of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 22 and *n*. 2.]

2 [*Footnote added* 1914:] Compare the drawing made by a nineteen-year-old manic patient reproduced in *Zbl. Psychoan*., **2**, 675. [Rorschach, 1912.] It represents a man with a necktie consisting of a snake which is turning in the direction of a girl. See also the story of 'The Bashful Man' in *Anthropophyteia*, **6**, 334: A lady went into a bathroom, and there she came upon a gentleman who scarcely had time to put on his shirt. He was very much embarrassed, but hurriedly covering his throat with the front part of his shirt, he exclaimed: 'Excuse me, but I've not got my necktie on.'

3 [See Freud's volume on *Jokes* (1905*c*), *RSE*, **8**, 47 f., in which he introduced the term 'joke-work' (on the analogy of 'dream-work') to designate the psychological processes involved in the production of jokes.]

dream-work makes use of baldness, hair-cutting, falling out of teeth and decapitation. If one of the ordinary symbols for a penis occurs in a dream doubled or multiplied, it is to be regarded as a warding off of castration.[1] The appearance in dreams of lizards – animals whose tails grow again if they are pulled off – has the same significance. (Cf. the lizard dream on p. 10 f.) – Many of the beasts which are used as genital symbols in mythology and folklore play the same part in dreams: e.g. fishes, snails, cats, mice (on account of the pubic hair), and above all those most important symbols of the male organ – snakes. Small animals and vermin represent small children – for instance, undesired brothers and sisters. Being plagued with vermin is often a sign of pregnancy. [1919.] – A quite recent symbol of the male organ in dreams deserves mention: the airship, whose use in this sense is justified by its connection with flying as well as sometimes by its shape. [1911.]

A number of other symbols have been put forward, with supporting instances, by Stekel, but have not yet been sufficiently verified. [1911.] Stekel's writings, and in particular his *Die Sprache des Traumes* (1911*a*), contain the fullest collection of interpretations of symbols. Many of these show penetration, and further examination has proved them correct: for instance, his section on the symbolism of death. But this author's lack of a critical faculty and his tendency to generalization at all costs throw doubts upon others of his interpretations or render them unusable; so that it is highly advisable to exercise caution in accepting his conclusions. I therefore content myself with drawing attention to only a few of his findings. [1914.]

According to Stekel, 'right' and 'left' in dreams have an ethical sense. 'The right-hand path always means the path of righteousness and the left-hand one that of crime. Thus "left" may represent homosexuality, [358]
incest or perversion, and "right" may represent marriage, intercourse with a prostitute and so on, always looked at from the subject's individual moral standpoint.' (Stekel, 1909, 466 ff.) – Relatives in dreams usually play the part of genitals (ibid., 473). I can only confirm this in the case of sons, daughters and younger sisters[2] – that is, only so far as they fall into the category of 'little ones'. On the other hand, I have come across undoubted cases in which 'sisters' symbolized the breasts and 'brothers' the larger hemispheres. – Stekel explains failing to catch up with a carriage as regret at a difference in age which cannot be caught

1 [This point is elaborated in Section II of Freud's paper on 'The "Uncanny"' (1919*h*), *RSE*, **17**, 229. See also Freud's posthumously published paper (written in 1922) on Medusa's head (1940*c*), ibid., **18**, 265 f., and below, p. 368.]

2 [And, apparently, younger brothers, see above, p. 318.]

up with (ibid., 479). – Luggage that one travels with is a load of sin, he says, that weighs one down (loc. cit.). [1911.] But precisely luggage often turns out to be an unmistakable symbol of the dreamer's own genitals. [1914.] – Stekel also assigns fixed symbolic meanings to numbers, such as often appear in dreams [ibid., 497 ff.]. But these explanations seem neither sufficiently verified nor generally valid, though his interpretations usually appear plausible in the individual cases. [1911.][1] In any case the number three has been confirmed from many sides as a symbol of the male genitals. [1914.][2]

One of the generalizations put forward by Stekel concerns the double significance of genital symbols. [1914.] 'Where', he asks, 'is there a symbol which – provided that the imagination by any means admits of it – cannot be employed both in a male and in a female sense?' [1911*a*, 73.] In any case the clause in parenthesis removes much of the certainty from this assertion, since in fact the imagination does not always admit of it. But I think it is worthwhile remarking that in my experience Stekel's generalization cannot be maintained in the face of the greater complexity of the facts. In addition to symbols which can stand with equal frequency for the male and for the female genitals, there are some which designate one of the sexes predominantly or almost exclusively, and yet
[359] others which are known *only* with a male or a female meaning. For it is a fact that the imagination does not admit of long, stiff objects and weapons being used as symbols of the female genitals, or of hollow objects, such as chests, cases, boxes, etc., being used as symbols for the male ones. It is true that the tendency of dreams and of unconscious phantasies to employ sexual symbols bisexually betrays an archaic characteristic; for in childhood the distinction between the genitals of the two sexes is unknown and the same kind of genitals are attributed to both of them. [1911.] But it is possible, too, to be misled into wrongly supposing that a sexual symbol is bisexual, if one forgets that in some dreams there is a general inversion of sex, so that what is male is represented as female and *vice versa*. Dreams of this kind may, for instance, express a woman's wish to be a man. [1925.]

The genitals can also be represented in dreams by other parts of the body: the male organ by a hand or a foot and the female genital orifice by the mouth or an ear or even an eye. The secretions of the human

1 [At this point, in the 1911 edition only, the following sentence appeared: 'In Wilhelm Stekel's recently published volume, *Die Sprache des Traumes*, which appeared too late for me to notice it, there is to be found (1911*a*, 72 f.) a list of the commonest sexual symbols which is intended to show that all sexual symbols can be employed bisexually.']

2 [A discussion of the number nine can be found in Section III of Freud (1923*d*), *RSE*, **19**, 79 f.]

body – mucus, tears, urine, semen, etc. – can replace one another in dreams. This last assertion of Stekel's [1911*a*, 49], which is on the whole correct, has been justifiably criticized by Reitler (1913*b*) as requiring some qualification: what in fact happens is that significant secretions, such as semen, are replaced by indifferent ones. [1919.]

It is to be hoped that these very incomplete hints may serve to encourage others to undertake a more painstaking general study of the subject. [1909.][1] I myself have attempted to give a more elaborate account of dream symbolism in my *Introductory Lectures on Psychoanalysis* (1916–17*a* [Lecture X]). [1919.]

I shall now append a few examples of the use of these symbols in dreams, with the idea of showing how impossible it becomes to arrive at the interpretation of a dream if one excludes dream symbolism, and how irresistibly one is driven to accept it in many cases. [1911.] At the same time, however, I should like to utter an express warning against overestimating the importance of symbols in dream interpretation, [360] against restricting the work of translating dreams merely to translating symbols and against abandoning the technique of making use of the dreamer's associations. The two techniques of dream interpretation must be complementary to each other; but both in practice and in theory the first place continues to be held by the procedure which I began by describing and which attributes a decisive significance to the comments made by the dreamer, while the translation of symbols, as I have explained it, is also at our disposal as an auxiliary method. [1909.]

1 [*Footnote added* 1911:] However much Scherner's view of dream symbolism may differ from the one developed in these pages, I must insist that he is to be regarded as the true discoverer of symbolism in dreams, and that the investigations of psychoanalysis have at last brought recognition to his book, published as it was so many years ago (in 1861), and for so long regarded as fantastic.

I
A HAT AS A SYMBOL OF A MAN (OR OF MALE GENITALS) [1911][1]

(Extract from the dream of a young woman suffering from agoraphobia as a result of fears of seduction)

'*I was walking in the street in the summer, wearing a straw hat of peculiar*
[361] *shape; its middle piece was bent upwards and its side-pieces hung down-wards*' (the description became hesitant at this point) '*in such a way that one side was lower than the other. I was cheerful and in a self-confident frame of mind; and, as I passed a group of young officers, I thought: "None of you can do me any harm!"*"

Since nothing occurred to her in connection with the hat in the dream, I said: 'No doubt the hat was a male genital organ, with its middle piece sticking up and its two side-pieces hanging down. It may seem strange, perhaps, that a hat should be a man, but you will remember the phrase "*Unter die Haube kommen*" ["to find a husband" (literally "to come under the cap")].' I intentionally gave her no interpretation of the detail about the two side-pieces hanging down unevenly; though it is precisely details of this kind that must point the way in determining an interpretation. I went on to say that as she had a husband with such fine genitals

1 [This dream and the two next ones were first published in a paper entitled 'Additions to the Interpretation of Dreams' (1911*a*). The paper was introduced by the following paragraphs, which have been reprinted in *GW*, **Nachtr.**, 604:

'*Some Instances of Dream Symbols*. – Of the many objections that have been raised against the procedure of psychoanalysis, the strangest, and, perhaps, one might add, the most ignorant, seems to me to be doubt as to the existence of symbolism in dreams and the unconscious. For no-one who carries out psychoanalyses can avoid assuming the presence of such symbolism, and the resolution of dreams by symbols has been practised from the earliest times. On the other hand, I am ready to admit that the occurrence of these symbols should be subject to particularly strict proof in view of their great multiplicity.

'In what follows I have put together some examples from my most recent experience: cases in which a solution by means of a particular symbol strikes me as especially revealing. By this means a dream acquires a meaning which it could otherwise never have found; it falls into place in the chain of the dreamer's thoughts and its interpretation is recognized by the subject himself.

'On a point of technique I may remark that a dreamer's associations are apt to fail precisely in connection with the symbolic elements of dreams. In my record of these few selected examples I have tried to draw a sharp line between the work of the patient (or dreamer) himself and my own interventions.'

The paper ended with some shorter examples, which can be found reprinted in Section F of this chapter (Nos. 2, 3 and 4 on p. 364 f.). In the original paper these were introduced as follows:

'*Some Rarer Forms of Representation*. – I have mentioned "considerations of representability" as one of the factors that influence the formation of dreams. In the process of transforming a thought into a visual image a peculiar faculty is revealed by dreamers, and an analyst is rarely equal to following it with his guesses. It will therefore give him real satisfaction if the intuitive perception of the dreamer – the creator of these representations – is able to explain their meaning.']

there was no need for her to be afraid of the officers – no need, that is, for her to wish for anything from them, since as a rule she was prevented from going for a walk unprotected and unaccompanied owing to her phantasies of being seduced. I had already been able to give her this last explanation of her anxiety on several occasions upon the basis of other material.

The way in which the dreamer reacted to this material was most remarkable. She withdrew her description of the hat and maintained that she had never said that the two side-pieces hung down. I was too certain of what I had heard to be led astray, and stuck to my guns. She was silent for a while and then found enough courage to ask what was meant by one of her husband's testes hanging down lower than the other and whether it was the same in all men. In this way the remarkable detail of the hat was explained and the interpretation accepted by her.

At the time my patient told me this dream I had long been familiar with the hat symbol. Other, less transparent cases had led me to suppose [362] that a hat can also stand for female genitals.[1]

II

A 'LITTLE ONE' AS THE GENITAL ORGAN – 'BEING RUN OVER' AS A SYMBOL OF SEXUAL INTERCOURSE [1911]

(Another dream of the same agoraphobic patient)

Her mother sent her little daughter away, so that she had to go by herself. Then she went on a train with her mother and saw her little one walk straight on to the rails so that she was bound to be run over. She heard the cracking of her bones. (This produced an uncomfortable feeling in her but no real horror.) Then she looked round out of the window of the railway carriage to see whether the parts could not be seen behind. Then she reproached her mother for having made the little one go by herself.

ANALYSIS: – It is no easy matter to give a complete interpretation of the dream. It formed part of a cycle of dreams and can only be fully understood if it is taken in connection with the others. There is difficulty in obtaining in sufficient isolation the material necessary for establishing the symbolism. – In the first place, the patient declared that

1 [*Footnote added* 1911:] Cf. an example of this in Kirchgraber (1912). Stekel (1909, 475) records a dream in which a hat with a feather standing up crooked in the middle of it symbolized an (impotent) man. [Freud suggested an explanation of hat symbolism in a later paper (1916–17*c*), *RSE*, **14**, 341 f.]

the train journey was to be interpreted historically, as an allusion to a journey she had taken when she was leaving a sanatorium for nervous diseases, with whose director, needless to say, she had been in love. Her mother had fetched her away, and the doctor had appeared at the station and handed her a bouquet of flowers as a parting present. It had been very awkward that her mother should have witnessed this tribute. At this point, then, her mother figured as interfering with her attempts at a love affair; and this had, in fact, been the part played by that severe lady during the patient's girlhood. – Her next association related to the sentence: 'she looked round to see whether the parts could not be seen from behind.' The façade of the dream would, of course, lead one to think of the parts of her little daughter who had been run over and
[363] mangled. But her association led in quite another direction. She recollected having once seen her father naked in the bathroom from behind; she went on to talk of the distinctions between the sexes, and laid stress on the fact that a man's genitals can be seen even from behind but a woman's cannot. In this connection she herself interpreted 'the little one' as meaning the genitals and 'her little one' – she had a four-year-old daughter – as her own genitals. She reproached her mother with having expected her to live as though she had no genitals, and pointed out that the same reproach was expressed in the opening sentence of the dream: 'her mother sent her little one away, so that she had to go by herself.' In her imagination 'going by herself in the streets' meant not having a man, not having any sexual relations ('*coire*' in Latin [from which 'coitus' is derived] means literally 'to go with') – and she disliked that. Her accounts all went to show that when she was a girl she had in fact suffered from her mother's jealousy owing to the preference shown her by her father.[1]

The deeper interpretation of this dream was shown by another dream of the same night, in which the dreamer identified herself with her brother. She had actually been a boyish girl, and had often been told that she should have been a boy. This identification with her brother made it particularly clear that 'the little one' meant a genital organ. Her mother was threatening him (or her) with castration, which could only have been a punishment for playing with her penis; thus the identification also proved that she herself had masturbated as a child – a memory which till then she had only had as applied to her brother. The

1 [In the 1911 edition only, the following sentence was added at this point: 'Stekel [1909, 473], basing himself on a very common idiomatic usage, has suggested that the "little one" is a symbol of the male or female genitals.']

information supplied by the second dream showed that she must have come to know about the male organ at an early age and have afterwards forgotten it. Further, the second dream alluded to the infantile sexual theory according to which girls are boys who have been castrated. [Cf. Freud, 1908*c*; *RSE*, **9**, 183 ff.] When I suggested to her that she had had this childish belief, she at once confirmed the fact by telling me that she had heard the anecdote of the little boy's saying to the little girl: 'Cut off?' and of the little girl's replying: 'No, always been like that.'

Thus the sending away of the little one (of the genital organ) in the first dream was also related to the threat of castration. Her ultimate complaint against her mother was for not having given birth to her as a boy. [364]

The fact that 'being run over' symbolizes sexual intercourse would not be obvious from this dream, though it has been confirmed from many other sources.

III
THE GENITALS REPRESENTED BY BUILDINGS, STAIRS AND SHAFTS [1911][1]

(The dream of a young man inhibited by his father complex)

He was going for a walk with his father in a place which must certainly have been the Prater[2] *since he saw the* ROTUNDA, *with a* SMALL ANNEX IN FRONT OF IT *to which* A CAPTIVE BALLOON *was attached, though it looked rather* LIMP. *His father asked him what all this was for; he was surprised at his asking, but explained it to him. Then they came into a courtyard which had a large sheet of tin laid out in it. His father wanted* TO PULL OFF *a large piece of it, but first looked around to see if anyone was watching. He told him that he need only tell the foreman and he could take some without any bother. A* STAIRCASE *led down from this yard into* A SHAFT, *whose walls were cushioned in some soft material, rather like a leather armchair. At the end of the shaft was a longish platform and then another* SHAFT *started. . . .*

ANALYSIS: – This dreamer belonged to a type whose therapeutic prospects are not favourable: up to a certain point they offer no resistance

1 [This dream and its interpretation are reproduced in Freud's *Introductory Lectures* (1916–17*a*), Lecture XII, No. 7; *RSE*, **15**, 168 ff. The original manuscript note of this dream, dated April 17, 1910, appears in Grubrich-Simitis (1993, 141 f.; trans., 105 f.).]

2 [See footnote 1, p. 170 above.]

at all to analysis, but from then onwards turn out to be almost inaccessible. He interpreted this dream almost unaided. 'The Rotunda', he said, 'was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was, that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. [365] Since he had in fact never questioned his father in this way, we had to look upon the dream thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment . . .' We shall presently find the continuation of this thought in another part of the dream.

The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream thought I have just interpreted may have continued in this way: '(If I had asked him), he would have deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation – namely that it stood for masturbating. Not only was I already familiar with this interpretation (see p. 311 *n*. 8 above), but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added from my own knowledge derived elsewhere that climbing down, like climbing up in other cases, described sexual intercourse in the vagina. (See my remarks [in Freud, 1910*d*], quoted above, p. 317 *n*. 2.)

The dreamer himself gave a biographical explanation of the fact that the first shaft was followed by a longish platform and then by another shaft. He had practised intercourse for a time but had then given it up on account of inhibitions, and he now hoped to be able to resume it by

the help of the treatment. The dream became more indistinct, however, towards the end, and it must seem probable to anyone who is familiar with these things that the influence of another topic was already making itself felt in the second scene of the dream, and was hinted at by the [366] father's business, by his deceitful conduct and by the interpretation of the first shaft as a vagina: all this pointed to a connection with the dreamer's mother.[1]

IV

THE MALE ORGAN REPRESENTED BY PERSONS AND THE FEMALE ORGAN BY A LANDSCAPE [1911]

(The dream of an uneducated woman whose husband was a policeman, reported by B. Dattner)

'*. . . Then someone broke into the house and she was frightened and called out for a policeman. But he had quietly gone into a church,*[2] *to which a number of steps*[3] *led up, accompanied by two tramps. Behind the church there was a hill*[4] *and above it a thick wood.*[5] *The policeman was dressed in a helmet, brass collar and cloak.*[6] *He had a brown beard. The two tramps, who went along peaceably with the policeman, had sacklike aprons tied round their middles.*[7] *In front of the church a path led up to the hill; on both sides of it there grew grass and brushwood, which became thicker and thicker and, at the top of the hill, turned into a regular wood.*'

1 [The following additional paragraph was appended to this dream on its first publication (in Freud, 1911*a*): 'This dream as a whole belongs to the not uncommon class of "biographical" dreams, in which the dreamer gives a survey of his sexual life in the form of a continuous narrative. (See the example [on p. 311 f. above].) – The frequency with which buildings, localities and landscapes are employed as symbolic representations of the body, and in particular (with constant reiteration) of the genitals, would certainly deserve a comprehensive study, illustrated by numerous examples.']

2 'Or chapel (= vagina).'

3 'Symbol of copulation.'

4 '*Mons veneris*.'

5 'Pubic hair.'

6 'According to an expert, demons in cloaks and hoods are of a phallic character.'

7 'The two halves of the scrotum.'

V
DREAMS OF CASTRATION IN CHILDREN [1919]

(*a*) A boy aged three years and five months, who obviously disliked the idea of his father's returning from the front, woke up one morning in a disturbed and excited state. He kept on repeating: '*Why was Daddy carrying his head on a plate? Last night Daddy was carrying his head on a plate.*'

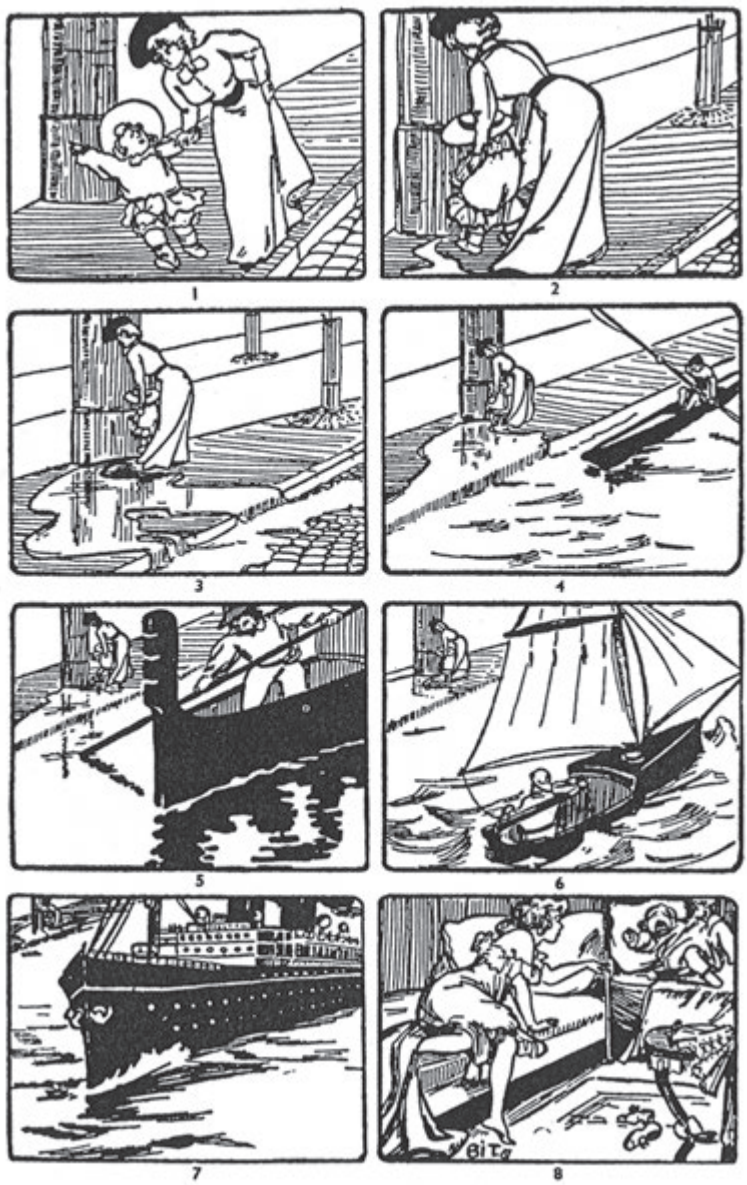
[367] (*b*) A student who is now suffering from a severe obsessional neurosis remembers having repeatedly had the following dream during his sixth year: *He went to the hairdresser's to have his hair cut. A big, severe-looking woman came up to him and cut his head off. He recognized the woman as his mother.*

VI
URINARY SYMBOLISM [1914]

The series of drawings reproduced [on p. 329 below] were found by Ferenczi in a Hungarian comic paper called *Fidibusz*, and he at once saw how well they could be used to illustrate the theory of dreams. Otto Rank has already reproduced them in a paper (1912*d*, [99]).

The drawings bear the title 'A French Nurse's Dream'; but it is only the last picture, showing the nurse being woken up by the child's screams, that tells us that the seven previous pictures represent the phases of a dream. The first picture depicts the stimulus which should have caused the sleeper to wake: the little boy has become aware of a need and is asking for help in dealing with it. But in the dream the dreamer, instead of being in the bedroom, is taking the child for a walk. In the second picture she has already led him to a street corner where he is micturating – and she can go on sleeping. But the arousal stimulus continues; indeed, it increases. The little boy, finding he is not being attended to, screams louder and louder. The more imperiously he insists upon his nurse waking up and helping him, the more insistent becomes the dream's assurance that everything is all right and that there is no need for her to wake up. At the same time, the dream translates the increasing stimulus into the increasing dimensions of its symbols. The stream of water produced by the micturating boy becomes mightier and mightier. In the fourth picture it is already large enough to float a rowing boat; but there follow a gondola, a sailing ship and finally a liner. The ingenious artist has in this way cleverly depicted the struggle between an obstinate craving for sleep and an inexhaustible stimulus towards waking.

[368]



A French Nurse's Dream

VII
A STAIRCASE DREAM [1911]

(Reported and interpreted by Otto Rank)[1]

[369] 'I have to thank the same colleague to whom I owe the dream with a dental stimulus [recorded on p. 347 ff. below] for an equally transparent emission dream:

'"*I was running down the staircase* [*of a block of flats*] *in pursuit of a little girl who had done something to me, in order to punish her. At the foot of the stairs someone (a grown-up woman?) stopped the child for me. I caught hold of her; but I don't know whether I hit her, for I suddenly found myself on the middle of the staircase copulating with the child (as it were in the air). It was not a real copulation; I was only rubbing my genitals against her external genitals, and while I did so I saw them extremely distinctly, as well as her head, which was turned upwards and sideways. During the sexual act I saw hanging above me to my left (also as it were in the air) two small paintings – landscapes representing a house surrounded by trees. At the bottom of the smaller of these, instead of the painter's signature, I saw my own first name, as though it were intended as a birthday present for me. Then I saw a label in front of the two pictures, which said that cheaper pictures were also to be had. (I then saw myself very indistinctly as though I were lying in bed on the landing) and I was woken up by the feeling of wetness caused by the emission I had had.*"

'INTERPRETATION: – On the evening of the dream day the dreamer had been in a bookshop, and as he was waiting to be attended to he had looked at some pictures which were on view there and which represented subjects similar to those in the dream. He went up close to one small picture which had particularly pleased him, to look at the artist's name – but it had been quite unknown to him.

'Later the same evening, when he was with some friends, he had heard a story of a Bohemian servant girl who boasted that her illegitimate child had been "made on the stairs". The dreamer had enquired the details of this rather unusual event and had learnt that the servant girl had gone home with her admirer to her parents' house, where there had been no opportunity for sexual intercourse, and in his excitement the man had
[370] copulated with her on the stairs. The dreamer had made a joking allusion to a malicious expression used to describe adulterated wines, and had said that in fact the child came of a "cellar-stair vintage".

1 [Apparently not published elsewhere.]

'So much for the connections with the previous day, which appeared with some insistence in the dream content and were reproduced by the dreamer without any difficulty. But he brought up no less easily an old fragment of infantile recollection which had also found its use in the dream. The staircase belonged to the house where he had spent the greater part of his childhood and, in particular, where he had first made conscious acquaintance with the problems of sex. He had frequently played on this staircase and, among other things, used to slide down the banisters, riding astride on them – which had given him sexual feelings. In the dream, too, he rushed down the stairs extraordinarily fast – so fast, indeed, that, according to his own specific account, he did not put his feet down on the separate steps but "flew" down them, as people say. If the infantile experience is taken into account, the beginning part of the dream seems to represent the factor of sexual excitement. – But the dreamer had also often romped in a sexual way with the neighbours' children on this same staircase and in the adjacent building, and had satisfied his desires in just the same way as he did in the dream.

'If we bear in mind that Freud's researches into sexual symbolism (1910*d* [see above, p. 317 *n*. 2]) have shown that stairs and going upstairs in dreams almost invariably stand for copulation, the dream becomes quite transparent. Its driving force [*Triebkraft*]^{T}, as indeed was shown by its outcome – an emission – was of a purely libidinal nature. The dreamer's sexual excitement was awakened during his sleep – this being represented in the dream by his rushing down the stairs. The sadistic element in the sexual excitement, based on the romping in childhood, was indicated by the pursuit and overpowering of the child. The libidinal excitement increased and pressed towards sexual action – represented in the dream by his catching hold of the child and conveying it to the middle of the staircase. Up to that point the dream was only *symbolically* sexual and would have been quite unintelligible to any inexperienced dream interpreter. But symbolic satisfaction of that kind was not enough to guarantee a restful sleep, in view of the strength of the libidinal excitation. The excitation led to an orgasm and thus revealed the fact that the whole staircase symbolism represented copulation. – The present dream offers a specially clear confirmation of Freud's view that one of the reasons for the use of going upstairs as a sexual symbol is the rhythmical character of both activities: for the dreamer expressly stated that the most clearly defined element in the whole dream was the rhythm of the sexual act and its up and down motion. [371]

'I must add a word with regard to the two pictures which, apart from

their real meaning, also figured in a symbolic sense as "*Weibsbilder*".[1] This was shown at once by there being a large picture and a small picture, just as a large (or grown-up) girl and a small one appeared in the dream. The fact that "cheaper pictures were also to be had" led to the prostitute complex; while on the other hand the appearance of the dreamer's first name on the small picture and the idea of its being intended as a birthday present for him were hints at the parental complex. ("Born on the stairs" = "begotten by copulation".)

'The indistinct final scene, in which the dreamer saw himself lying in bed on the landing and had a feeling of wetness, seems to have pointed the way beyond infantile masturbation still further back into childhood and to have had its prototype in similarly pleasurable scenes of bedwetting.'

VIII
A MODIFIED STAIRCASE DREAM [1911]

One of my patients, a man whose sexual abstinence was imposed on him by a severe neurosis, and whose [unconscious] phantasies were fixed upon his mother, had repeated dreams of going upstairs in her company. I once remarked to him that a moderate amount of masturbation would probably do him less harm than his compulsive self-restraint, and this provoked the following dream:

His piano teacher reproached him for neglecting his piano-playing, and for not practising Moscheles' 'Études' and Clementi's 'Gradus ad Parnassum'.

[372] By way of comment, he pointed out that '*Gradus*' are also 'steps'; and that the keyboard itself is a staircase, since it contains scales [ladders].

It is fair to say that there is no group of ideas that is incapable of representing sexual facts and wishes.

IX
THE FEELING OF REALITY AND THE REPRESENTATION OF REPETITION [1919]

A man who is now thirty-five years old reported a dream which he remembered clearly and claimed to have had at the age of four. *The lawyer who had charge of his father's will* – he had lost his father when he was three – *brought two large pears. He was given one of*

1 [Literally 'pictures of women' – a common German idiom for 'women'.]

them to eat; the other lay on the window-sill in the sitting room. He awoke with a conviction of the reality of what he had dreamt and kept obstinately asking his mother for the second pear, and insisted that it was on the window-sill. His mother had laughed at this.

ANALYSIS: – The lawyer was a jovial old gentleman who, the dreamer seemed to remember, had really once brought some pears along. The window-sill was as he had seen it in the dream. Nothing else occurred to him in connection with it – only that his mother had told him a dream shortly before. She had had two birds sitting on her head and had asked herself when they would fly away; they did not fly away, but one of them flew to her mouth and sucked at it.

The failure [*Das Versagen*]^{T} of the dreamer's associations [*Einfälle*]^{T} gave us a right to attempt an interpretation by symbolic substitution. The two pears – '*pommes ou poires*' – were his mother's breasts which had given him nourishment; the window-sill was the projection formed by her bosom – like balconies in dreams of houses (see p. 317). His feeling of reality after waking was justified, for his mother had really suckled him, and had done so, in fact, for far longer than the usual time and his mother's breast was still available to him.[1] The dreamer must be translated: 'Give (or show) me your breast again, Mother, that I used to drink from in the past.' 'In the past' was represented by his eating one of the pears; 'again' was represented by his longing for the other. The *temporal repetition* of an act is regularly shown in dreams by the *numerical multiplication* of an object. *Versagung* [373]

It is most remarkable, of course, that symbolism should already be playing a part in the dream of a four-year-old child. But this is the rule and not the exception. It may safely be asserted that dreamers have symbolism at their disposal from the very first.

The following uninfluenced recollection by a lady who is now twenty-seven shows at what an early age symbolism is employed outside dream life as well as inside it. *She was between three and four years old. Her nursemaid took her to the lavatory along with a brother eleven months her junior and a girl cousin of an age between the other two, to do their small business before going out for a walk. Being the eldest, she sat on the seat, while the other two sat on chambers. She asked her cousin: 'Have you got a purse too? Walter's got a little*

1 [Cf. p. 166 above. This point – the fact that a specially strong feeling after waking of the reality of the dream or of some part of it actually relates to the latent dream thoughts – is insisted upon by Freud in Chapter II of his study on Jensen's *Gradiva* (1907*a*), *RSE*, **9**, 46, and in the course of his first comments on the 'Wolf Man's' dream (Section IV of Freud, 1918*b*), ibid., **17**, 29 f.]

sausage; I've got a purse.' Her cousin replied: 'Yes, I've got a purse too.' The nursemaid heard what they said with much amusement and reported the conversation to the children's mother, who reacted with a sharp reprimand.

I will here interpolate a dream (recorded in a paper by Alfred Robitsek, 1912) in which the beautifully chosen symbolism made an interpretation possible with only slight assistance from the dreamer.

X
'THE QUESTION OF SYMBOLISM IN THE DREAMS OF NORMAL PERSONS' [1914]

'One objection which is frequently brought forward by opponents of psychoanalysis, and which has lately been voiced by Havelock Ellis (1911*a*, 168), argues that though dream symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psychoanalytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in
[374] the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.

"'*I arrange the centre of a table with flowers for a birthday.*"[1] In reply to a question she told me that in the dream she seemed to be in her own home (where she was not at present living) and had "a feeling of happiness".

"'Popular" symbolism made it possible for me to translate the dream unaided. It was an expression of her bridal wishes: the table with its

1 [In the present analysis all the material printed in italics occurs in English in the original, exactly as here reproduced.]

floral centrepiece symbolized herself and her genitals; she represented her wishes for the future as fulfilled, for her thoughts were already occupied with the birth of a baby; so her marriage lay a long way behind her.

'I pointed out to her that "*the 'centre' of a table*" was an unusual expression (which she admitted), but I could not, of course, question her further directly on that point. I carefully avoided suggesting the meaning of the symbols to her, and merely asked her what came into her head in connection with the separate parts of the dream. In the course of the analysis her reserve gave place to an evident interest in the interpretation and to an openness made possible by the seriousness of the conversation.

'When I asked what flowers they had been, her first reply was: "*expensive flowers, one has to pay for them*", and then that they had been "*lilies of the valley, violets and pinks or carnations*". I assumed that the word "lily" appeared in the dream in its popular sense as a symbol of chastity; she confirmed this assumption, for her association to "lily" was "*purity*". "*Valley*" is a frequent female symbol in dreams; so that the chance combination of the two symbols in the English name of the flower was used [375]
in the dream symbolism to stress the preciousness of her virginity – "*expensive flowers, one has to pay for them*" – and to express her expectation that her husband would know how to appreciate its value. The phrase "*expensive flowers*, etc.", as will be seen, had a different meaning in the case of each of the three flower symbols.

'"*Violets*" was ostensibly quite asexual; but, very boldly, as it seemed to me, I thought I could trace a secret meaning for the word in an unconscious link with the French word "*viol*" ["rape"]. To my surprise the dreamer gave as an association the English word "*violate*". The dream had made use of the great chance similarity between the words "*violet*" and "*violate*" – the difference in their pronunciation lies merely in the different stress upon their final syllables – in order to express "in the language of flowers" the dreamer's thoughts on the violence of defloration (another term that employs flower symbolism) and possibly also a masochistic trait in her character. A pretty instance of the "verbal bridges" [see p. 305 *n*. 1 above] crossed by the paths leading to the unconscious. The words "*one has to pay for them*" signified having to pay with her life for being a wife and a mother.

'In connection with "*pinks*", which she went on to call "*carnations*", I thought of the connection between that word and "carnal". But the dreamer's association to it was "*colour*". She added that "*carnations*"

were the flowers which her fiancé gave her frequently and in great numbers. At the end of her remarks she suddenly confessed of her own accord that she had not told the truth: what had occurred to her had not been "*colour*" but "*incarnation*" – the word I had expected. Incidentally "*colour*" itself was not a very remote association, but was determined by the meaning of "*carnation*" (flesh colour) – was determined, that is, by the same complex. This lack of straightforwardness showed that it was at this point that resistance was greatest, and corresponded to the fact that this was where the symbolism was most clear and that the struggle between libido and its repression was at its most intense in relation to this phallic theme. The dreamer's comment to the effect that her fiancé frequently gave her flowers of that kind was an indication not only of the double sense of the word "*carnations*" but also of their phallic meaning in the dream. The gift of flowers, an exciting factor of the dream derived from her current life, was used to express
[376] an exchange of sexual gifts: she was making a gift of her virginity and expected a full emotional and sexual life in return for it. At this point, too, the words "*expensive flowers, one has to pay for them*" must have had what was no doubt literally a financial meaning. – Thus the flower symbolism in this dream included virginal femininity, masculinity and an allusion to defloration by violence. It is worth pointing out in this connection that sexual flower symbolism, which, indeed, occurs very commonly in other connections, symbolizes the human organs of sex by blossoms, which are the sexual organs of plants. It may perhaps be true in general that gifts of flowers between lovers have this unconscious meaning.

'The birthday for which she was preparing in the dream meant, no doubt, the birth of a baby. She was identifying herself with her fiancé, and was representing him as "arranging" her for a birth – that is, as copulating with her. The latent thought may have run: "If I were he, I wouldn't wait – I would deflower my fiancée without asking her leave – I would use violence." This was indicated by the word "*violate*", and in this way the sadistic component of the libido found expression.

'In a deeper layer of the dream, the phrase "*I arrange . . .*" must no doubt have an auto-erotic, that is to say, an infantile, significance.

'The dreamer also revealed an awareness, which was only possible to her in a dream, of her physical deficiency: she saw herself like a table, without projections, and on that account laid all the more emphasis on the preciousness of the "*centre*" – on another occasion she used the words "*a centrepiece of flowers*" – that is to say, on her virginity. The

horizontal attribute of a table must also have contributed something to the symbol.

'The concentration of the dream should be observed: there was nothing superfluous in it, every word was a symbol.

'Later on the dreamer produced an addendum [*Nachtrag*][T] to the dream: "*I decorate the flowers with green crinkled paper*." She added that it was "*fancy paper*" of the sort used for covering common flower pots. She went on: "*to hide untidy things, whatever was to be seen, which was not pretty to the eye; there is a gap, a little space in the flowers. The paper looks like velvet or moss*." – To "*decorate*" she gave the association "*decorum*", as I had expected. She said the green colour predominated, and her association to it was "*hope*" – another link with pregnancy. – In this part of the dream the chief factor was not identification with a man; ideas of shame and self-revelation came to the fore. She was making herself beautiful for him and was admitting physical defects which she felt ashamed of and was trying to correct. Her associations "*velvet*" and "*moss*" were a clear indication of a reference to pubic hair. *Nachträglichkeit* [377]

'This dream, then, gave expression to thoughts of which the girl was scarcely aware in her waking life – thoughts concerned with sensual love and its organs. She was being "arranged for a birthday" – that is, she was being copulated with. The fear of being deflowered was finding expression, and perhaps, too, ideas of pleasurable suffering. She admitted her physical deficiencies to herself and overcompensated for them by an overvaluation of her virginity. Her shame put forward as an excuse for the signs of sensuality the fact that its purpose was the production of a baby. Material considerations, too, alien to a lover's mind, found their way to expression. The affect attaching to this simple dream – a feeling of happiness – indicated that powerful emotional complexes had found satisfaction in it.'

Ferenczi (1917)[I] has justly pointed out that the meaning of symbols and the significance of dreams can be arrived at with particular ease from the dreams of precisely those people who are uninitiated into psychoanalysis.

At this point I shall interpose a dream dreamt by a contemporary historical figure. I am doing so because in it an object that would in any case appropriately represent a male organ has a further attribute which established it in the clearest fashion as a phallic symbol. The fact of a

1 [This paragraph was added in 1919.]

riding whip growing to an endless length could scarcely be taken to mean anything but an erection. Apart from this, too, the dream is an excellent instance of the way in which thoughts of a serious kind, far removed from anything sexual, can come to be represented by infantile sexual material.

XI
A DREAM OF BISMARCK'S [1919][1]

[378] 'In his *Gedanken und Erinnerungen* [1898, **2**, 194; English translation by A. J. Butler, *Bismarck, the Man and the Statesman*, 1898, **2**, 209 f.] Bismarck quotes a letter written by him to the Emperor Wilhelm I on December 18, 1881, in the course of which the following passage occurs: "Your Majesty's communication encourages me to relate a dream which I had in the Spring of 1863, in the hardest days of the Conflict, from which no human eye could see any possible way out. I dreamt (as I related the first thing next morning to my wife and other witnesses) that I was riding on a narrow Alpine path, precipice on the right, rocks on the left. The path grew narrower, so that the horse refused to proceed, and it was impossible to turn round or dismount, owing to lack of space. Then, with my whip in my left hand, I struck the smooth rock and called on God. The whip grew to an endless length, the rocky wall dropped like a piece of stage scenery and opened out a broad path, with a view over hills and forests, like a landscape in Bohemia; there were Prussian troops with banners, and even in my dream the thought came to me at once that I must report it to your Majesty. This dream was fulfilled, and I woke up rejoiced and strengthened. . . ."

'The action of this dream falls into two sections. In the first part the dreamer found himself in an *impasse* from which he was miraculously rescued in the second part. The difficult situation in which the horse and its rider were placed is an easily recognizable dream picture of the statesman's critical position, which he may have felt with particular bitterness as he thought over the problems of his policy on the evening before the dream. In the passage quoted above Bismarck himself uses the same simile [of there being no possible "way out"] in describing the hopelessness of his position at the time. The meaning of the dream picture must therefore have been quite obvious to him. We are at the same time presented with a fine example of Silberer's "functional phenomenon" [cf. p. 450 ff. below]. The processes taking place in the

1 From a paper by Hanns Sachs [1913].

dreamer's mind – each of the solutions attempted by his thoughts being met in turn by insuperable obstacles, while nevertheless he could not [379]
and might not tear himself free from the consideration of those problems – were most appropriately depicted by the rider who could neither advance nor retreat. His pride, which forbade his thinking of surrendering or resigning, was expressed in the dream by the words "it was impossible to turn round or dismount". In his quality of a man of action who exerted himself unceasingly and toiled for the good of others, Bismarck must have found it easy to liken himself to a horse; and in fact he did so on many occasions, for instance, in his well-known saying: "A good horse dies in harness." In this sense the words "the horse refused to proceed" meant nothing more nor less than that the overtired statesman felt a need to turn away from the cares of the immediate present, or, to put it another way, that he was in the act of freeing himself from the bonds of the reality principle by sleeping and dreaming. The wish fulfilment, which became so prominent in the second part of the dream, was already hinted at in the words "Alpine path". No doubt Bismarck already knew at that time that he was going to spend his next vacation in the Alps – at Gastein; thus the dream, by conveying him thither, set him free at one blow from all the burdens of state business.

'In the second part of the dream, the dreamer's wishes were represented as fulfilled in two ways: undisguisedly and obviously, and, in addition, symbolically. Their fulfilment was represented symbolically by the disappearance of the obstructive rock and the appearance in its place of a broad path – the "way out", which he was in search of, in its most convenient form; and it was represented undisguisedly in the picture of the advancing Prussian troops. In order to explain this prophetic vision there is no need whatever for constructing mystical hypotheses; Freud's theory of wish fulfilment fully suffices. Already at the time of this dream Bismarck desired a victorious war against Austria as the best escape from Prussia's internal conflicts. Thus the dream was representing this wish as fulfilled, just as is postulated by Freud, when the dreamer saw the Prussian troops with their banners in Bohemia, that is, in enemy country. The only peculiarity of the case was that the dreamer with whom we are here concerned was not content with the fulfilment of his wish in a *dream* but knew how to achieve it in *reality*. One feature which cannot fail to strike anyone familiar with the psychoanalytic technique of interpretation is the riding whip – which grew to an "endless length". [380]
Whips, sticks, lances and similar objects are familiar to us as phallic symbols; but when a whip further possesses the most striking

characteristic of a phallus, its extensibility, scarcely a doubt can remain. The exaggeration of the phenomenon, its growing to an "endless length", seems to hint at a hypercathexis [*Überbesetzung*][1] from infantile sources. The fact that the dreamer took the whip in his hand was a clear allusion to masturbation, though the reference was not, of course, to the dreamer's contemporary circumstances but to childish desires in the remote past. The interpretation discovered by Dr Stekel [1909, 466 ff.] that in dreams "left" stands for what is wrong, forbidden and sinful is much to the point here, for it might very well be applied to masturbation carried out in childhood in the face of prohibition. Between this deepest infantile stratum and the most superficial one, which was concerned with the statesman's immediate plans, it is possible to detect an intermediate layer which was related to both the others. The whole episode of a miraculous liberation from need by striking a rock and at the same time calling on God as a helper bears a remarkable resemblance to the biblical scene in which Moses struck water from a rock for the thirsting Children of Israel. We may unhesitatingly assume that this passage was familiar in all its details to Bismarck, who came of a Bible-loving Protestant family. It would not be unlikely that in this time of conflict Bismarck should compare himself with Moses, the leader, whom the people he sought to free rewarded with rebellion, hatred and ingratitude. Here, then, we should have the connection with the dreamer's contemporary wishes. But on the other hand the Bible passage contains some details which apply well to a masturbation phantasy. Moses seized the rod in the face of God's command and the Lord punished him for this transgression by telling him that he must die without entering the Promised Land. The prohibited seizing of the rod (in the dream an unmistakably phallic one), the production of fluid from its blow, the threat of death – in these we find all the principal factors of infantile masturbation united. We may observe with interest the process of revision which has welded together these two heterogeneous pictures
[381] (originating, the one from the mind of a statesman of genius, and the other from the impulses of the primitive mind of a child) and which has by that means succeeded in eliminating all the distressing factors. The fact that seizing the rod was a forbidden and rebellious act was no longer indicated except symbolically by the "left" hand which performed it. On the other hand, God was called on in the manifest content of the dream as though to deny as ostentatiously as possible any thought

1 [Sachs seems to be using the word simply to mean an 'additional cathexis' and not in the special sense in which Freud uses it below on pp. 531, 539 and 551.]

of a prohibition or secret. Of the two prophecies made by God to Moses – that he should see the Promised Land but that he should not enter it – the first is clearly represented as fulfilled ("the view over hills and forests"), while the second, highly distressing one was not mentioned at all. The water was probably sacrificed to the requirements of secondary revision [cf. p. 437 ff. below], which successfully endeavoured to make this scene and the former one into a single unity; instead of water, the rock itself fell.

'We should expect that at the end of an infantile masturbation phantasy, which included the theme of prohibition, the child would wish that the people in authority in his environment should learn nothing of what had happened. In the dream this wish was represented by its opposite, a wish to report to the King immediately what had happened. But this reversal fitted excellently and quite unobtrusively into the phantasy of victory contained in the superficial layer of dream thoughts and in a portion of the manifest content of the dream. A dream such as this of victory and conquest is often a cover for a wish to succeed in an *erotic* conquest; certain features of the dream, such as, for instance, that an obstacle was set in the way of the dreamer's advance but that after he had made use of the extensible whip a broad path opened out, might point in that direction, but they afford an insufficient basis for inferring that a definite trend of thoughts and wishes of that kind ran through the dream. We have here a perfect example of completely successful dream distortion. Whatever was obnoxious in it was worked over so that it never emerged through the surface layer that was spread over it as a protective covering. In consequence of this it was possible to avoid any release of anxiety. The dream was an ideal case of a wish successfully fulfilled without infringing the censorship; so that we may well believe that the dreamer awoke from it "rejoiced and strengthened".'

As a last example, here is: [382]

XII
A CHEMIST'S DREAM [1909]

This was dreamt by a young man who was endeavouring to give up his habit of masturbating in favour of sexual relations with women.

PREAMBLE: On the day before he had the dream he had been instructing a student on the subject of Grignard's reaction, in which magnesium is dissolved in absolutely pure ether through the catalytic action of iodine.

Two days earlier, when the same reaction was being carried out, an explosion had occurred which had burnt the hand of one of the workers.

DREAM: (I) *He was supposed to be making phenyl-magnesium-bromide. He saw the apparatus with particular distinctness, but had substituted himself for the magnesium. He now found himself in a singularly unstable state. He kept on saying to himself: 'This is all right, things are working, my feet are beginning to dissolve already, my knees are getting soft.' Then he put out his hands and felt his feet. Meanwhile (how, he could not tell) he pulled his legs out of the vessel and said to himself once more: 'This can't be right. Yes it is, though.' At this point he partly woke up and went through the dream to himself, so as to be able to report it to me. He was positively frightened of the solution*[1] *of the dream. He felt very much excited during this period of semi-sleep and kept repeating: 'Phenyl, phenyl.'*

(II) *He was at ——ing with his whole family and was due to be at the Schottentor*[2] *at half-past eleven to meet a particular lady. But he only woke at half-past eleven, and said to himself: 'It's too late. You can't get there before half-past twelve.' The next moment he saw the whole family sitting round the table; he saw his mother particularly clearly and the maidservant carrying the soup tureen. So he thought: 'Well, as we've started dinner, it's too late for me to go out.'*

ANALYSIS: – He had no doubt that even the first part of the dream had some connection with the lady whom he was to meet. (He had had the dream during the night before the expected rendezvous.) He thought
[383] the student to whom he had given the instructions a particularly unpleasant person. He had said to him: 'That's not right', because the magnesium showed no signs of being affected. And the student had replied, as though he were quite unconcerned: 'No, nor it is.' The student must have stood for himself (the patient), who was just as indifferent about the analysis as the student was about the synthesis. The 'he' in the dream who carried out the operation stood for me. How unpleasant I must think him for being so indifferent about the result!

On the other hand, he (the patient) was the material which was being used for the analysis (or synthesis). What was in question was the success of the treatment. The reference to his legs in the dream reminded him of an experience of the previous evening. He had been having a dancing lesson and had met a lady of whom he had been eager to make

1 [German '*Auflösung*'; also the word used above for 'dissolving'.]

2 ['——ing' was presumably a suburb of Vienna (see p. 265 above); the Schottentor is near the middle of the town.]

a conquest. He clasped her to himself so tightly that on one occasion she gave a scream. As he relaxed his pressure against her legs, he felt her strong responsive pressure against the lower part of his thighs as far down as his knees – the point mentioned in his dream. So that in this connection it was the woman who was the magnesium in the retort – things were working at last. He was feminine in relation to me, just as he was masculine in relation to the woman. If it was working with the lady it was working with him in the treatment. His feeling himself and the sensations in his knees pointed to masturbation and fitted in with his fatigue on the previous day. – His appointment with the lady had in fact been for half-past eleven. His wish to miss it by oversleeping and to stay with his sexual objects at home (that is, to keep to masturbation) corresponded to his resistance.

In connection with his repeating the word 'phenyl', he told me that he had always been very fond of all these radicals ending in 'yl', because they were so easy to use: benzyl, acetyl, etc. This explained nothing. But when I suggested '*Schlemihl*' to him as another radical in the series,[1] he laughed heartily and told me that in the course of the summer he had read a book by Marcel Prévost in which there was a chapter on '*Les exclus de l'amour*' which in fact included some remarks upon '*les Schlémiliés*'. When he read them he had said to himself: 'This is just what I'm like.' – If he had missed the appointment it would have been another example of his 'Schlemihlness'. [384]

It would seem that the occurrence of sexual symbolism in dreams has already been experimentally confirmed by some work carried out by K. Schrötter, on lines proposed by H. Swoboda. Subjects under deep hypnosis were given suggestions by Schrötter, and these led to the production of dreams a large part of whose content was determined by the suggestions. If he gave a suggestion that the subject should dream of normal or abnormal sexual intercourse, the dream, in obeying the suggestion, would make use of symbols familiar to us from psychoanalysis in place of the sexual material. For instance, when a suggestion was made to a female subject that she should dream of having homosexual intercourse with a friend, the friend appeared in the dream carrying a shabby handbag with a label stuck on to it bearing the words 'Ladies only'. The woman who dreamt this was said never to have had any knowledge of symbolism in dreams or of their interpretation. Difficulties are, however, thrown in the way of our forming an opinion of the

1 ['Schlemihl', which rhymes with the words ending in '-yl', is a word of Hebrew origin commonly used in German to mean an unlucky, incompetent person.]

value of these interesting experiments by the unfortunate circumstance that Dr Schrötter committed suicide soon after making them. The only record of them is to be found in a preliminary communication published in the *Zentralblatt für Psychoanalyse* (Schrötter, 1912). [1914.]

Similar findings were published by Roffenstein in 1923. Some experiments made by Betlheim & Hartmann (1924) were of particular interest, since they made no use of hypnosis. These experimenters related anecdotes of a coarsely sexual character to patients suffering from Korsakoff's syndrome and observed the distortions which occurred when the anecdotes were reproduced by the patients in these confusional states. They found that the symbols familiar to us from the interpretation of dreams made their appearance (e.g. going upstairs, stabbing and shooting as symbols of copulation, and knives and cigarettes as symbols of the penis). The authors attached special importance to the appearance of the symbol of a staircase, for, as they justly observed, 'no conscious desire to distort could have arrived at a symbol of such a kind'. [1925.]

[385] It is only now, after we have properly assessed the importance of symbolism in dreams, that it becomes possible for us to take up the theme of typical dreams, which was broken off on p. 245 above. [1914.] I think we are justified in dividing such dreams roughly into two classes: those which really always have the same meaning, and those which, in spite of having the same or a similar content, must nevertheless be interpreted in the greatest variety of ways. Among typical dreams of the first class I have already [p. 243 ff.] dealt in some detail with examination dreams. [1909.]

Dreams of missing a train deserve to be put alongside examination dreams on account of the similarity of their affect, and their explanation shows that we shall be right in doing so. They are dreams of consolation for another kind of anxiety felt in sleep – the fear of dying. 'Departing' on a journey is one of the commonest and best authenticated symbols of death. These dreams say in a consoling way: 'Don't worry, you won't die (depart)', just as examination dreams say soothingly: 'Don't be afraid, no harm will come to you this time either.' The difficulty of understanding both these kinds of dreams is due to the fact that the feeling of anxiety is attached precisely to the expression of consolation. [1911.][1]

1 [In the 1911 edition only, the following sentence appeared at this point: 'Death symbols are dealt with at length in the recently published volume by Stekel (1911*a*).']

The meaning of dreams 'with a dental stimulus' [cf. p. 201 above],[1] which I often had to analyse in patients, escaped me for a long time because, to my surprise, there were invariably too strong resistances against their interpretation. Overwhelming evidence left me at last in no doubt that in males the driving force [*Triebkraft*] of these dreams was derived from nothing other than the masturbatory desires of the pubertal period. I will analyse two dreams of this kind, one of which is also a 'flying dream'. They were both dreamt by the same person, a young man with strong homosexual leanings, which were, however, inhibited in real life.

He was attending a performance of 'Fidelio' and was sitting in the stalls at the opera beside L., a man who was congenial to him and with whom he would have liked to make friends. Suddenly he flew through the air right across the stalls, put his hand in his mouth and pulled out two of his teeth. [386]

He himself said of the flight that it was as though he was being 'thrown' into the air. Since it was a performance of *Fidelio*, the words:

> Wer ein holdes Weib errungen . . .

might have seemed appropriate. But the gaining of even the loveliest woman was not among the dreamer's wishes. Two other lines were more to the point:

> Wem der *grosse Wurf* gelungen,
> Eines Freundes Freund zu sein . . .[2]

The dream, in fact, contained this 'great throw', which, however, was not only a wish fulfilment. It also concealed the painful reflection that the dreamer had often been unlucky in his attempts at friendship, and had been 'thrown out'. It concealed, too, his fear that this misfortune might be repeated in relation to the young man by whose side he was enjoying the performance of *Fidelio*. And now followed what the

1 [This and the following six paragraphs date from 1909.]

2 [Wem der grosse Wurf gelungen,
Eines Freundes Freund zu sein,
Wer ein holdes Weib errungen . . .

'He who has won the *great throw* of becoming the friend of a friend, he who has gained a lovely woman . . . !' These are the opening lines of the second stanza of Schiller's *Hymn to Joy*, which was set to music by Beethoven in his Choral Symphony. But the third of these lines (the one first quoted above by Freud) is, in fact, also the opening line of the last section of the final chorus in Beethoven's opera *Fidelio* – his librettist having apparently plagiarized Schiller.]

fastidious dreamer regarded as a shameful confession: that once, after being rejected by one of his friends, he had masturbated twice in succession in the state of sensual excitement provoked by his desire.

Here is the second dream: *He was being treated by two university professors of his acquaintance instead of by me. One of them was doing something to his penis. He was afraid of an operation. The other was pushing against his mouth with an iron rod, so that he lost one or two of his teeth. He was tied up with four silk cloths.*

It can scarcely be doubted that this dream had a sexual meaning. The silk cloths identified him with a homosexual whom he knew. The
[387] dreamer had never carried out coitus and had never aimed at having sexual intercourse with men in real life; and he pictured sexual intercourse on the model of the pubertal masturbation with which he had once been familiar.

The many modifications of the typical dream with a dental stimulus (dreams, for instance, of a tooth being pulled out by someone else, etc.) are, I think, to be explained in the same way.[1] It may, however, puzzle us to discover how 'dental stimuli' have come to have this meaning. But I should like to draw attention to the frequency with which sexual repression makes use of transpositions from a lower to an upper part of the body.[2] Thanks to them it becomes possible in hysteria for all kinds of sensations and intentions to be put into effect, if not where they properly belong – in relation to the genitals, at least in relation to other, unobjectionable parts of the body. One instance of a transposition of this kind is the replacement of the genitals by the face in the symbolism of unconscious thinking. Linguistic usage follows the same line in recognizing the buttocks ['*Hinterbacken*', literally 'back-cheeks'] as homologous to the cheeks, and by drawing a parallel between the '*labia*' and the lips which frame the aperture of the mouth. Comparisons between nose and penis are common, and the similarity is made more complete by the presence of hair in both places. The one structure which affords no possibility of an analogy is the teeth; and it is precisely this combination of similarity and dissimilarity which makes the teeth so appropriate for representational purposes when pressure is being exercised by sexual repression.

I cannot pretend that the interpretation of dreams with a dental

1 [*Footnote added* 1914:] A tooth being pulled out by someone else in a dream is as a rule to be interpreted as castration (like having one's hair cut by a barber, according to Stekel). A distinction must in general be made between dreams with a dental stimulus and dentist dreams, such as those recorded by Coriat (1913).

2 [Instances of this can be found in the case history of 'Dora' (Freud, 1905*e*), *RSE*, 7, 27–8. The comparison which follows had been drawn by Freud in a letter to Fliess of January 16, 1899 (Freud, 1950*a*, Letter 102).]

stimulus as dreams of masturbation – an interpretation whose correctness seems to me beyond doubt – has been entirely cleared up.[1] I have given what explanation I can and must leave what remains [388] unsolved. But I may draw attention to another parallel to be found in linguistic usage. In our part of the world the act of masturbation is vulgarly described as '*sich einen ausreissen*' or '*sich einen herunterreissen*' [literally 'pulling one out' or 'pulling one down'].[2] I know nothing of the source of this terminology or of the imagery on which it is based; but 'a tooth' would fit very well into the first of the two phrases.

According to popular belief dreams of teeth being pulled out are to be interpreted as meaning the death of a relative, but psychoanalysis can at most confirm this interpretation only in the joking sense I have alluded to above. In this connection, however, I will quote a dream with a dental stimulus that has been put at my disposal by Otto Rank.[3]

'A colleague of mine, who has for some time been taking a lively interest in the problems of dream interpretation, has sent me the following contribution to the subject of dreams with a dental stimulus.

'"A short time ago I had a dream that *I was at the dentist's and he was drilling a back tooth in my lower jaw. He worked on it so long that the tooth became useless. He then seized it with a forceps and pulled it out with an effortless ease that excited my astonishment. He told me not to bother about it, for it was not the tooth that he was really treating, and put it on the table, where the tooth (as it now seemed to me, an upper incisor) fell apart into several layers. I got up from the dentist's chair, went closer to it with a feeling of curiosity, and raised a medical question which interested me. The dentist explained to me, while he separated out the various portions of the strikingly white tooth and crushed them up (pulverized them) with an instrument, that it was connected with puberty and that it was only before puberty that teeth came out so easily, and that in the case of women the decisive factor was the birth of a child.*

'"I then became aware (while I was half-asleep, I believe) that the dream had been accompanied by an emission, which I could not attach with certainty, however, to any particular part of the dream; I was most

1 [*Footnote added* 1909:] A communication by C. G. Jung informs us that dreams with a dental stimulus occurring in women have the meaning of birth dreams. – [*Added* 1919:] Ernest Jones [1914*b*] has brought forward clear confirmation of this. The element in common between this interpretation and the one put forward above lies in the fact that in both cases (castration and birth) what is in question is the separation of a part of the body from the whole.

2 [*Footnote added* 1911:] Cf. the 'biographical' dream on p. 311 [and *n.* 8].

3 [This paragraph and the quotation from Rank which follows were first included in 1911. The quotation is from Rank (1911*c*). Cf. the same dreamer's staircase dream on p. 330 above.]

inclined to think that it had already occurred while the tooth was being pulled out.

[389] "'I then went on to dream of an occurrence which I can no longer recall, but which ended *with my leaving my hat and coat somewhere (possibly in the dentist's cloakroom) in the hope that someone would bring them after me, and with my hurrying off, dressed only in my overcoat, to catch a train which was starting. I succeeded at the last moment in jumping on to the hindmost carriage where someone was already standing. I was not able, though, to make my way into the inside of the carriage, but was obliged to travel in an uncomfortable situation from which I tried, successfully in the end, to escape. We entered a big tunnel and two trains, going in the opposite direction to us, passed through our train as if it were the tunnel. I was looking into a carriage window as though I were outside*.

"'The following experiences and thoughts from the previous day provide material for an interpretation of the dream:

"'(I.) I had, in fact, been having dental treatment recently, and at the time of the dream I was having continual pain in the tooth in the lower jaw which was being drilled in the dream and at which the dentist had, again in reality, worked longer than I liked. On the morning of the dream day I had once more been to the dentist on account of the pain; and he had suggested to me that I should have another tooth pulled out in the same jaw as the one he had been treating, saying that the pain probably came from this other one. This was a 'wisdom tooth' which I was cutting just then. I had raised a question touching his medical conscience in that connection.

"'(II.) On the afternoon of the same day, I had been obliged to apologize to a lady for the bad temper I was in owing to my toothache; whereupon she had told me she was afraid of having a root pulled out, the crown of which had crumbled away almost entirely. She thought that pulling out 'eye teeth' was especially painful and dangerous, although on the other hand one of her acquaintances had told her that it was easier to pull out teeth in the upper jaw, which was where hers was. This acquaintance had also told her that he had once had the wrong tooth pulled out under an anaesthetic, and this had increased her dread of the necessary operation. She had then asked me whether 'eye teeth' were molars or canines, and what was known about them. I pointed out to her on the one hand the superstitious element in all these opinions, though at the same time I emphasized the nucleus of truth in certain popular views. She was then able to repeat to me what she

believed was a very old and widespread popular belief – that if a pregnant [390]
woman had toothache she would have a boy.

"'(III.) This saying interested me in connection with what Freud says in his *Interpretation of Dreams* on the typical meaning of dreams with a dental stimulus as substitutes for masturbation, since in the popular saying [quoted by the lady] a tooth and male genitals (or a boy) were also brought into relation with each other. On the evening of the same day, therefore, I read through the relevant passage in *The Interpretation of Dreams* and found there among other things the following statements whose influence upon my dream may be observed just as clearly as that of the other two experiences I have mentioned. Freud writes of dreams with a dental stimulus that 'in males the driving force [*Triebkraft*] of these dreams was derived from nothing other than the masturbatory desires of the pubertal period' [p. 345 above]. And further: 'The many modifications of the typical dream with a dental stimulus (dreams, for instance, of a tooth being pulled out by someone else, etc.) are, I think, to be explained in the same way. It may, however, puzzle us to discover how "dental stimuli" should have come to have this meaning. But I should like to draw attention to the frequency with which sexual repression makes use of transpositions from a lower to an upper part of the body.' (In the present dream from the lower jaw to the upper jaw.) 'Thanks to them it becomes possible in hysteria for all kinds of sensations and intentions to be put into effect, if not where they properly belong – in relation to the genitals, at least in relation to other, unobjectionable parts of the body' [p. 346]. And again: 'But I may draw attention to another parallel to be found in linguistic usage. In our part of the world the act of masturbation is vulgarly described as "*sich einen ausreissen*" or "*sich einen herunterreissen*"' [p. 347]. I was already familiar with this expression in my early youth as a description of masturbation, and no experienced dream interpreter will have any difficulty in finding his way from here to the infantile material underlying the dream. I will add only that the ease with which the tooth in the dream, which after its extraction turned into an upper incisor, came out reminded me of an occasion in my childhood on which I myself pulled out a loose upper front tooth easily and without pain. This event, which I can still remember clearly today in all its details, occurred at the same early period to [391]
which my first conscious attempts at masturbation go back. (This was a screen memory [*Deckerinnerung*][T].)

"'Freud's reference to a statement by C. G. Jung to the effect that 'dreams with a dental stimulus occurring in women have the meaning

of birth dreams' [p. 347 *n.* 1 above], as well as the popular belief in the significance of toothache in pregnant women, accounted for the contrast drawn in the dream between the decisive factor in the case of females and of males (puberty). In this connection I recall an earlier dream of mine which I had soon after a visit to the dentist and in which I dreamt that the gold crowns which had just been fixed fell out; this annoyed me very much in the dream on account of the considerable expense in which I had been involved and which I had not yet quite got over at the time. This other dream now became intelligible to me (in view of a certain experience of mine) as a recognition of the material advantages of masturbation over object love: the latter, from an economic point of view, was in every respect less desirable (cf. the gold crowns);[1] and I believe that the lady's remark about the significance of toothache in pregnant women had reawakened these trains of thought in me."

'So much for the interpretation put forward by my colleague, which is most enlightening and to which, I think, no objections can be raised. I have nothing to add to it, except, perhaps, a hint at the probable meaning of the second part of the dream. This seems to have represented the dreamer's transition from masturbation to sexual intercourse, which was apparently accomplished with great difficulty – (cf. the tunnel through which the trains went in and out in various directions) as well as the danger of the latter (cf. pregnancy and the overcoat [see p. 164 f. above]). The dreamer made use for this purpose of the verbal bridges "*Zahn-ziehen (Zug)*" and "*Zahn-reissen (Reisen)*".[2]

'On the other hand, theoretically, the case seems to me interesting in two respects. In the first place, it brings evidence in favour of Freud's discovery that ejaculation in a dream accompanies the act of pulling out a tooth. In whatever form the emission may appear, we are obliged to regard it as a masturbatory satisfaction brought about without the
[392] assistance of any mechanical stimulation. Moreover, in this case, the satisfaction accompanying the emission was not, as it usually is, directed to an object, even if only to an imaginary one, but had no object, if one may say so; it was completely auto-erotic, or at the most showed a slight trace of homosexuality (in reference to the dentist).

'The second point which seems to me to deserve emphasis is the following. It may plausibly be objected that there is no need at all to regard the present case as confirming Freud's view, since the events of the

1 [The crown (*Krone*) was at this time the Austrian monetary unit.]

2 ['*Zahn-ziehen*' = 'to pull out a tooth'; '*Zug*' (from the same root as '*ziehen*') = 'train' or 'pull'. '*Zahn-reissen*' = 'to pull out a tooth'; '*Reisen*' (pronounced not much unlike '*reissen*') = 'to travel'.]

previous day would be sufficient in themselves to make the content of the dream intelligible. The dreamer's visit to the dentist, his conversation with the lady and his reading of *The Interpretation of Dreams* would quite sufficiently explain how he came to produce this dream, especially as his sleep was disturbed by toothache; they would even explain, if need be, how the dream served to dispose of the pain which was disturbing his sleep – by means of the idea of getting rid of the painful tooth and by simultaneously drowning with libido the painful sensation which the dreamer feared. But even if we make the greatest possible allowance for all this, it cannot be seriously maintained that the mere reading of Freud's explanations could have established in the dreamer the connection between pulling out a tooth and the act of masturbation, or could even have put that connection into operation, unless it had been laid down long since, as the dreamer himself admits it was (in the phrase "*sich einen ausreissen*"). This connection may have been revived not only by his conversation with the lady but by a circumstance which he reported subsequently. For in reading *The Interpretation of Dreams* he had been unwilling, for comprehensible reasons, to believe in this typical meaning of dreams with a dental stimulus, and had felt a desire to know whether that meaning applied to *all* dreams of that sort. The present dream confirmed the fact that this was so, at least as far as he was concerned, and thus showed him why it was that he had been obliged to feel doubts on the subject. In this respect too, therefore, the dream was the fulfilment of a wish – namely, the wish to convince himself of the range of application and the validity of this view of Freud's.'

The second group of typical dreams include those in which the dreamer flies or floats in the air, falls, swims, etc. What is the meaning of such [393] dreams? It is impossible to give a general reply. As we shall hear, they mean something different in every instance; it is only the raw material of sensations contained in them which is always derived from the same source. [1909.]

The information provided by psychoanalyses forces me to conclude that these dreams, too, reproduce impressions of childhood; they relate, that is, to games involving movement, which are extraordinarily attractive to children. There cannot be a single uncle who has not shown a child how to fly by rushing across the room with him in his outstretched arms, or who has not played at letting him fall by riding him on his knee and then suddenly stretching out his leg, or by holding him up high and then suddenly pretending to drop him. Children are delighted by such

experiences and never tire of asking to have them repeated, especially if there is something about them that causes a little fright or giddiness. In after years they repeat these experiences in dreams; but in the dreams they leave out the hands which held them up, so that they float or fall unsupported. The delight taken by young children in games of this kind (as well as in swings and seesaws) is well known; when they come to see acrobatic feats in a circus their memory of such games is revived. Hysterical attacks in boys sometimes consist merely in reproductions of feats of this kind, carried out with great skill. It not uncommonly happens that these games of movement, though innocent in themselves, give rise to sexual feelings. Childish romping [*Hetzen*], if I may use a word which commonly describes all such activities, is what is being repeated in dreams of flying, falling, giddiness and so on; while the pleasurable feelings attached to these experiences are transformed into anxiety. But, often enough, as every mother knows, romping among children actually ends in squabbling and tears. [1900.]

Thus I have good grounds for rejecting the theory that what provokes dreams of flying and falling is the state of our tactile feelings during sleep or sensations of the movement of our lungs, and so on. In my view these sensations are themselves reproduced as part of the memory to which the dream goes back: that is to say, they are part of the *content* of the dream and not its source. [1900.][1]

[394] This material, then, consisting of sensations of movement of similar kinds and derived from the same source, is used to represent dream thoughts of every possible sort. Dreams of flying or floating in the air (as a rule, pleasurably toned) require the most various interpretations; with some people these interpretations have to be of an individual character, whereas with others they may even be of a typical kind. One of my women patients used very often to dream that she was floating at a certain height over the street without touching the ground. She was very short, and she dreaded the contamination involved in contact with other people. Her floating dream fulfilled her two wishes, by raising her feet from the ground and lifting her head into a higher stratum of air. In other women I have found that flying dreams expressed a desire 'to be like a bird'; while other dreamers became angels during the night because they had not been called angels during the day. The close connection of flying with the idea of birds explains how it is that in men

1 [*Footnote added* 1930:] These remarks on dreams of movement are repeated here, since the present context requires them. See above, p. 241 f. [where some additional footnotes can be found].

flying dreams usually have a grossly sensual meaning;[1] and we shall not be surprised when we hear that some dreamer or other is very proud of his powers of flight. [1909.]

Dr Paul Federn (of Vienna [and later of New York]) has put forward[2] the attractive theory that a good number of these flying dreams are dreams of erection; for the remarkable phenomenon of erection, around which the human imagination has constantly played, cannot fail to be impressive, involving as it does an apparent suspension of the laws of gravity. (Cf. in this connection the winged phalli of the ancients.) [1911.]

It is a remarkable fact that Mourly Vold, a sober-minded investigator of dreams and one who is disinclined to interpretation of any kind, also supports the erotic interpretation of flying or floating dreams (Vold, 1910–12, **2**, 791). He speaks of the erotic factor as 'the most powerful motive for floating dreams', draws attention to the intense feeling of vibration in the body that accompanies such dreams and points to the frequency with which they are connected with erections or emissions. [1914.]

Dreams of falling, on the other hand, are more often characterized by anxiety. Their interpretation offers no difficulty in the case of women, who almost always accept the symbolic use of falling as a way of describing a surrender to an erotic temptation. Nor have we yet exhausted the infantile sources of dreams of falling. Almost every child has fallen down at one time or other and afterwards been picked up and petted; or if he has fallen out of his cot at night, has been taken into bed with his mother or nurse. [1909.] [395]

People who have frequent dreams of swimming and who feel great joy in cleaving their way through the waves, and so on, have as a rule been bedwetters and are repeating in their dreams a pleasure which they have long learnt to forgo. We shall learn presently [p. 357 ff. below] from more than one example what it is that dreams of swimming are most easily used to represent. [1909.]

The interpretation of dreams of fire justifies the nursery law which forbids a child to 'play with fire' – so that he shall not wet his bed at night. For in their case, too, there is an underlying recollection of the enuresis of childhood. In my 'Fragment of an Analysis of a Case of Hysteria' [1905*e*, Section II, 'Dora's' first dream], I have given a complete analysis and synthesis of a fire dream of this kind in connection

1 [See p. 522 *n.* 2 below.]

2 [At a meeting of the Vienna Psychoanalytical Society. See his subsequent paper on the subject (Federn, 1914, 126).]

with the dreamer's case history, and I have shown what impulses of adult years this infantile material can be used to represent. [1911.]

It would be possible to mention a whole number of other 'typical' dreams if we take the term to mean that the same manifest dream content is frequently to be found in the dreams of different dreamers. For instance we might mention dreams of passing through narrow streets or of walking through whole suites of rooms [cf. p. 190 above], and dreams of burglars – against whom, incidentally, nervous people take precautions *before* they go to sleep [cf. p. 361]; dreams of being pursued by wild animals (or by bulls or horses) [cf. p. 366 f.] or of being threatened with knives, daggers or lances – these last two classes being characteristic of the manifest content of the dreams of people who suffer from anxiety – and many more. An investigation specially devoted to this material would thoroughly repay the labour involved. But instead of
[396] this I have two[I] observations to make, though these do not apply exclusively to typical dreams. [1909.]

The more one is concerned with the solution of dreams, the more one is driven to recognize that the majority of the dreams of adults deal with sexual material and give expression to erotic wishes. A judgement on this point can be formed only by those who really analyse dreams, that is to say, who make their way through their manifest content to the latent dream thoughts, and never by those who are satisfied with making a note of the manifest content alone (like Näcke, for instance, in his writings on sexual dreams). Let me say at once that this fact is not in the least surprising but is in complete harmony with the principles of my explanation of dreams. No other drive [*Trieb*][T] has been subjected since childhood to so much suppression as the sexual drive with its numerous components (cf. my *Three Essays on the Theory of Sexuality*, 1905*d*); from no other drive are so many and such powerful unconscious wishes left over, ready to produce dreams in a state of sleep. In interpreting dreams we should never forget the significance of sexual complexes,

1 [This 'two' is a vestige of the 1909 and 1911 editions, in which the whole discussion on 'typical' dreams was contained in Chapter V. The first observation, introduced by a 'I', began with the paragraph which now follows and continued to the end of the present Section E – to p. 361. The second observation, introduced by a 'II', immediately followed; it was the passage beginning on p. 314 above with the words 'When we have become familiar' and continuing to the words 'another example of his "Schlemihlness"' on p. 343, with which, in those two editions, Chapter V ended. In later editions, of course, both these passages have become very greatly enlarged by the accretion of fresh material. In the 1909 edition the two observations together only occupied about five pages, as compared with forty-two in 1930.]

though we should also, of course, avoid the exaggeration of attributing exclusive importance to them. [1909.]

We can assert of many dreams, if they are carefully interpreted, that they are bisexual, since they unquestionably admit of an 'over-interpretation' in which the dreamer's homosexual impulses are realized – impulses, that is, which are contrary to his normal sexual activities. To maintain, however, as do Stekel (1911*a*, [71]) and Adler (1910, etc.), that *all* dreams are to be interpreted bisexually appears to me to be a generalization which is equally undemonstrable and implausible and which I am not prepared to support. In particular, I cannot dismiss the obvious fact that there are numerous dreams which satisfy needs other than those which are erotic in the widest sense of the word: dreams of hunger and thirst, dreams of convenience, etc. So, too, such statements as that [397]
'the spectre of death is to be found behind every dream' (Stekel [1911*a*, 34]), or that 'every dream shows an advance from the feminine to the masculine line' (Adler [1910]), appear to me to go far beyond anything that can be legitimately maintained in dream interpretation. [1911.]

The assertion that all dreams require a sexual interpretation, against which critics rage so incessantly, occurs nowhere in my *Interpretation of Dreams*. It is not to be found in any of the numerous editions of this book and is in obvious contradiction to other views expressed in it. [1919.][1]

I have already shown elsewhere [p. 161 ff. above] that strikingly innocent dreams may embody crudely erotic wishes, and I could confirm this by many new instances. But it is also true that many dreams which appear to be *indifferent* and which one would not regard as in any respect peculiar lead back on analysis to wishful impulses which are unmistakably sexual and often of an unexpected sort. Who, for instance, would have suspected the presence of a sexual wish in the following dream before it had been interpreted? The dreamer gave this account of it: *Standing back a little behind two stately palaces was a little house with closed doors. My wife led me along the piece of street up to the little house and pushed the door open; I then slipped quickly and easily into the inside of a court which rose in an incline*. Anyone, however, who has had a little experience in translating dreams will at once reflect that penetrating into narrow spaces and opening closed doors are among the commonest sexual symbols, and will easily perceive in this dream a representation of an attempt at *coitus a tergo* (between the two stately buttocks of the female body). The narrow passage rising in an incline stood, of course,

1 [This point is more fully dealt with on p. 142 *n*. above.]

for the vagina. The assistance attributed by the dreamer to his wife forces us to conclude that in reality it was only consideration for her that restrained the dreamer from making attempts of this kind. It turned out that on the dream day a girl had come to live in the dreamer's household who had attracted him and had given him the impression that she would raise no great objections to an approach of that kind. The little house between the two palaces was a reminiscence of the Hradshin [Citadel] in Prague and was a further reference to the same girl, who came from that place. [1909.]

[398] When I insist to one of my patients on the frequency of Oedipus dreams, in which the dreamer has sexual intercourse with his own mother, he often replies: 'I have no recollection of having had any such dream.' Immediately afterwards, however, a memory will emerge of some other inconspicuous and indifferent dream, which the patient has dreamt repeatedly. Analysis then shows that this is, in fact, a dream with the same content – once more an Oedipus dream. I can say with certainty that *disguised* dreams of sexual intercourse with the dreamer's mother are many times more frequent than straightforward ones. [1909.][1]

1 [*Footnote added* 1911:] I have published elsewhere a typical example of a disguised Oedipus dream of this kind. [Freud 1910*l*; now reprinted at the end of this footnote.] Another example, with a detailed analysis, has been published by Otto Rank (1911*a*). – [*Added* 1914:] For some other disguised Oedipus dreams, in which eye symbolism is prominent, see Rank (1913*a*). Other papers on eye dreams and eye symbolism, by Eder [1913], Ferenczi [1913*d*] and Reitler [1913*a*] can be found in the same place. The blinding in the legend of Oedipus, as well as elsewhere, stands for castration. – [*Added* 1911:] Incidentally, the symbolic interpretation of undisguised Oedipus dreams was not unknown to the ancients. Rank (1910*a*, 534) writes: 'Thus Julius Caesar is reported to have had a dream of sexual intercourse with his mother which was explained by the dream interpreters as a favourable augury for his taking possession of the earth (Mother Earth). The oracle given to the Tarquins is equally well known, which prophesied that the conquest of Rome would fall to that one of them who should first kiss his mother ("*osculum matri tulerit*"). This was interpreted by Brutus as referring to Mother Earth. ("*Terram osculo contigit, scilicet quod ea communis mater omnium mortalium esset*." ["He kissed the earth, saying it was the common mother of all mortals."] Livy, I, 56.)' – [*Added* 1914:] Compare in this connection the dream of Hippias reported by Herodotus (VI, 107 [*Trans.* 1922, 259]): 'As for the Persians, they were guided to Marathon by Hippias son of Pisistratus. Hippias in the past night had seen a vision in his sleep wherein he thought that he lay with his own mother; he interpreted this dream to signify that he should return to Athens and recover his power, and so die an old man in his own mother-country.' – [*Added* 1911:] These myths and interpretations reveal a true psychological insight. I have found that people who know that they are preferred or favoured by their mother give evidence in their lives of a peculiar self-reliance and an unshakeable optimism which often seem like heroic attributes and bring actual success to their possessors.*

[This reprint of the short paper by Freud (1910*l*) which is mentioned at the beginning of the present footnote was added here in 1925:]

'TYPICAL EXAMPLE OF A DISGUISED OEDIPUS DREAM: A man dreamt that *he had a secret liaison with a lady whom someone else wanted to marry. He was worried in case this other man might discover the liaison and the proposed marriage come to nothing. He therefore behaved in a very affectionate way to the man. He embraced him and kissed him*. – There was only one point of contact between the content of this dream and the facts of the dreamer's life. He had a secret liaison with a married woman; and an ambiguous remark made by her husband, who was a friend of his, led him to suspect that the husband might have noticed something. But in reality there was something else involved, all mention of which was avoided in the dream but which

In some dreams of landscapes or other localities emphasis is laid in [399]
the dream itself on a convinced feeling of having been there once before. (Occurrences of '*déjà vu*' in dreams have a special meaning.[1]) These places are invariably the genitals of the dreamer's mother; there is indeed no other place about which one can assert with such conviction that one has been there once before. [1909.]

On one occasion only I was perplexed by an obsessional neurotic who told me a dream in which he was visiting a house that he had been in *twice* before. But this particular patient had told me a considerable time before of an episode during his sixth year. On one occasion he had been sharing his mother's bed and misused the opportunity by inserting his finger into her genitals while she was asleep. [1914.]

A large number of dreams,[2] often accompanied by anxiety and having as their content such subjects as passing through narrow spaces or being in water, are based upon phantasies of intrauterine life, of existence in the womb and of the act of birth. What follows was the dream of a young man who, in his imagination, had taken advantage of an [400]
intrauterine opportunity of watching his parents copulating.

He was in a deep pit with a window in it like the one in the Semmering Tunnel.[3] *At first he saw an empty landscape through the window, but then invented a picture to fit the space, which immediately appeared and filled in the gap. The picture represented a field which was being ploughed up deeply by some implement; and the fresh air together with the idea of hard work which accompanied the scene, and the blue-black clods of earth, produced a lovely impression. He then went on further and saw a book upon education open in front of him . . . and was surprised that so*

alone provided a key to its understanding. The husband's life was threatened by an organic illness. His wife was prepared for the possibility of his dying suddenly, and the dreamer was consciously occupied with an intention to marry the young widow after her husband's death. This external situation placed the dreamer in the constellation of the Oedipus dream. His wish was capable of killing the man in order to get the woman as his wife. The dream expressed this wish in a hypocritically distorted form. Instead of her being married already, he made out that someone else wanted to marry her, which corresponded to his own secret intentions; and his hostile wishes towards her husband were concealed behind demonstrations of affection which were derived from his memory of his relations with his own father in childhood.' [Hypocritical dreams are discussed on pp. 128 f. *n.* above and 421 ff. below.]

* [The case of Goethe is mentioned by Freud as an instance of the success in life of a mother's favourite, in his paper on 'A Childhood Recollection from *Dichtung und Wahrheit*' (1917*b*), *RSE*, **17**, 147.]

1 [This last sentence was interpolated in 1914. The phenomenon of '*déjà vu*' in general is discussed by Freud in Chapter XII (D) of his *Psychopathology of Everyday Life* (1901*b*), ibid., **6**, and in another short paper (Freud, 1914*a*). See also below, p. 399.]

2 [This paragraph and the three following ones date from 1909.]

3 [A tunnel some 70 miles from Vienna on the main line to the southwest.]

much attention was devoted in it to the sexual feelings (of children); and this led him to think of me.

And here is a pretty water dream, dreamt by a woman patient, which served a special purpose in the treatment. *At her summer holiday resort, by the Lake of ——, she dived into the dark water just where the pale moon was mirrored in it.*

Dreams like this one are birth dreams. Their interpretation is reached by reversing the event reported in the manifest dream; thus, instead of 'diving into the water' we have 'coming out of the water', i.e. being born.[1] We can discover the locality from which a child is born by calling to mind the slang use of the word '*lune*' in French [viz. 'bottom']. The pale moon was thus the white bottom which children are quick to guess that they came out of. What was the meaning of the patient's wishing to be born at her summer holiday resort? I asked her and she replied without hesitation: 'Isn't it just as though I had been reborn through the treatment?' Thus the dream was an invitation to me to continue treating her at the holiday resort – that is, to visit her there. Perhaps there was a very timid hint in it, too, of the patient's wish to become a mother herself.[2]

[401] I will quote another birth dream, together with its interpretation, from a paper by Ernest Jones [1910*b*].[3] '*She stood on the seashore watching a small boy, who seemed to be hers, wading into the water. This he did till the water covered him and she could only see his head bobbing up and down near the surface. The scene then changed into the crowded hall of a hotel. Her husband left her, and she "entered into conversation with" a stranger.* The second half of the dream revealed itself in the analysis as representing a flight from her husband and the entering into intimate relations with a third person. . . . The first part of the dream was a fairly evident birth phantasy. In dreams as in mythology, the delivery of the child *from* the uterine waters is commonly presented by distortion as the entry of the child *into* water; among many others, the births of Adonis, Osiris, Moses and Bacchus are well-known

1 [*Footnote added* 1914:] For the mythological significance of birth from the water see Rank (1909).

2 [*Footnote added* 1909:] It was not for a long time that I learnt to appreciate the importance of phantasies and unconscious thoughts about life in the womb. They contain an explanation of the remarkable dread that many people have of being buried alive; and they also afford the deepest unconscious basis for the belief in survival after death, which merely represents a projection into the future of this uncanny life before birth. *Moreover, the act of birth is the first experience of anxiety, and thus the source and prototype of the affect of anxiety.* [Cf. a much later discussion of this in Chapter VIII of Freud's *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 118 f.]

3 [This paragraph and the following one were added in 1914.]

illustrations of this. The bobbing up and down of the head into the water at once recalled to the patient the sensation of quickening she had experienced in her only pregnancy. Thinking of the boy going into the water induced a reverie in which she saw herself taking him out of the water, carrying him to a nursery, washing him and dressing him, and installing him in her household.

'The second half of the dream therefore represented thoughts concerning the elopement, that belonged to the first half of the underlying latent content; the first half of the dream corresponded with the second half of the latent content, the birth phantasy. Besides this inversion in order, further inversions took place in each half of the dream. In the first half the child *entered* the water, and then his head bobbed; in the underlying dream thoughts first the quickening occurred and then the child *left* the water (a double inversion). In the second half her husband left her; in the dream thoughts she left her husband.'

Abraham (1909, 22 ff.) has reported another birth dream, dreamt by a young woman who was facing her first confinement. A subterranean channel led direct into the water from a place in the floor of her room (genital canal – amniotic fluid). She raised a trapdoor in the floor and a creature dressed in brown fur, very much resembling a seal, promptly appeared. This creature turned out to be the dreamer's younger brother, [402]
to whom she had always been like a mother. [1911.]

Rank [1912*d*] has shown from a series of dreams that birth dreams make use of the same symbolism as dreams with a urinary stimulus. The erotic stimulus is represented in the latter as a urinary stimulus; and the stratification of meaning in these dreams corresponds to a change that has come over the meaning of the symbol since infancy. [1914.]

This is an appropriate point at which to return to a topic that was broken off in an earlier chapter (p. 211):[1] the problem of the part played in the formation of dreams by organic stimuli which disturb sleep. Dreams which come about under their influence openly exhibit not only the usual tendency to wish fulfilment and to serving the end of convenience, but very often a perfectly transparent symbolism as well; for it not infrequently happens that a stimulus awakens a dreamer *after a vain attempt has been made to deal with it in a dream under a symbolic disguise*. This applies to dreams of emission or orgasm as well as to those provoked by a need to micturate or defaecate. 'The peculiar nature of emission dreams not only puts us in a position to reveal

1 [This paragraph and the three following ones date from 1919.]

directly certain sexual symbols which are already known as being typical, but which have nevertheless been violently disputed; it also enables us to convince ourselves that some apparently innocent situations in dreams are no more than a symbolic prelude to crudely sexual scenes. The latter are as a rule represented undisguisedly in the relatively rare emission dreams, whereas they culminate often enough in anxiety dreams, which have the same result of awakening the sleeper.' [Rank, 1912*d*, 55.]

The symbolism of dreams with a urinary stimulus is especially transparent and has been recognized from the earliest times. The view was already expressed by Hippocrates that dreams of fountains and springs indicate a disorder of the bladder (Havelock Ellis [1911*a*, 164]). Scherner [1861, 189] studied the multiplicity of the symbolism of urinary stimuli and asserted that 'any urinary stimulus of considerable strength invariably passes over into stimulation of the sexual regions and symbolic representations of them. . . . Dreams with a urinary stimulus are often at the same time representatives of sexual dreams.' [Ibid., 192.]

[403] Otto Rank, whose discussion in his paper on the stratification of symbols in arousal dreams [Rank, 1912*d*] I am here following, has made it seem highly probable that a great number of dreams with a urinary stimulus have in fact been caused by a *sexual* stimulus which has made a first attempt to find satisfaction regressively in the infantile form of urethral erotism. [Ibid., 78.] Those cases are particularly instructive in which the urinary stimulus thus set up leads to awakening and emptying the bladder, but in which the dream is nevertheless continued and the need then expressed in undisguisedly erotic imagery.[1]

Dreams with an intestinal stimulus throw light in an analogous fashion on the symbolism involved in them, and at the same time confirm the connection between gold and faeces which is also supported by copious evidence from social anthropology. (See Freud, 1908*b* [and 1958*a*]; Rank, 1912*d*; Dattner, 1913; and Reik, 1915*b*.) 'Thus, for instance, a woman who was receiving medical treatment for an intestinal disorder dreamt of someone who was burying a treasure in the neighbourhood of a little wooden hut which looked like a rustic outdoor closet. There

1 [*Footnote added* 1919:] 'The same symbols which occur in their infantile aspect in bladder dreams appear with an eminently sexual meaning in their "recent" aspects: Water = urine = semen = amniotic fluid; ship = "pump ship" (micturate) = uterus (box); to get wet = enuresis = copulation = pregnancy; to swim = full bladder = abode of the unborn; rain = micturate = symbol of fertility; travel (starting, getting out) = getting out of bed = sexual intercourse (honeymoon); micturate = emission.' (Rank, 1912*d*, 95.)

was a second part to the dream in which she was wiping the behind of her little girl who had dirtied herself.' [Rank, 1912*d*, 55.]

Rescue dreams are connected with birth dreams. In women's dreams, to rescue, and especially to rescue from the water, has the same significance as giving birth; but the meaning is modified if the dreamer is a man.[1] [1911.]

Robbers, burglars and ghosts, of whom some people feel frightened before going to bed, and who sometimes pursue their victims after they are asleep, all originate from one and the same class of infantile reminiscence. They are the nocturnal visitors who rouse children and take them up to prevent their wetting their beds, or who lift the bedclothes to make sure where they have put their hands in their sleep. Analyses of some of these anxiety dreams have made it possible for me to identify these nocturnal visitors more precisely. In every case the robbers stood for the sleeper's father, whereas the ghosts corresponded to female figures in white nightgowns. [1909.] [404]

1 [*Footnote added* 1911:] A dream of this kind has been reported by Pfister (1909). For the symbolic meaning of rescuing see Freud (1910*d*) and (1910*h*). [*Added* 1914:] See also Rank (1911*b*) and Reik (1911). [*Added* 1919:] See, further, Rank (1914*a*). [A dream of rescue from the water can be found in the second case discussed by Freud in his paper on 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 203.]

(F)
SOME EXAMPLES – CALCULATIONS AND SPEECHES IN DREAMS[1]

[405] Before assigning the fourth of the factors which govern the formation of dreams to its proper place [cf. p. 437 ff. below], I propose to quote a number of examples from my collection. These will serve partly to illustrate the interplay between the three factors already known to us and partly to provide confirmatory evidence for what have hitherto been unsupported assertions or to indicate some conclusions which inevitably follow from them. In giving an account of the dream-work, I have found very great difficulty in backing my findings by examples. Instances in support of particular propositions carry conviction only if they are treated in the context of the interpretation of a dream as a whole. If they are torn from their context they lose their virtue; while, on the other hand, a dream interpretation which is carried even a little way below the surface quickly becomes so voluminous as to make us lose the thread of the train of thought which it was designed to illustrate. This technical difficulty must serve as my excuse if in what follows I string together all sorts of things, whose only common bond is their connection with the contents of the preceding sections of this chapter. [1900.]

I will begin by giving a few instances of peculiar or unusual modes of representation in dreams.

A lady had the following dream: *A servant girl was standing on a ladder as if she were cleaning a window, and had a chimpanzee with her and a gorilla-cat* (the dreamer afterwards corrected this to *an angora* [406] *cat*). *She hurled the animals at the dreamer; the chimpanzee cuddled up to her, which was very disgusting*. – This dream achieved its purpose by an extremely simple device: it took a figure of speech literally and gave an exact representation of its wording. 'Monkey', and animals' names in general, are used as invectives; and the situation in the dream meant neither more nor less than 'hurling invectives'. In the course of the present series of dreams we shall come upon a number of other instances of the use of this simple device during the dream-work. [1900.]

1 [As in the case of Section E, a large part of the first half of the present section was added to the work in its later editions. The date of the first inclusion of each paragraph can accordingly be found attached to it in square brackets. The second half of the section (from p. 370 onwards) dates from the first edition. – Another collection of examples of dream analyses can be found in Lecture XII of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 160 ff.]

Another dream adopted a very similar procedure. *A woman had a child with a remarkably deformed skull. The dreamer had heard that the child had grown like that owing to its position in the uterus. The doctor said that the skull might be given a better shape by compression, but that that would damage the child's brain. She reflected that as he was a boy it would do him less harm.* – This dream contained a plastic representation of the abstract concept of 'impressions on children' which the dreamer had met with in the course of the explanations given her during her treatment. [1900.]

The dream-work adopted a slightly different method in the following instance. The dream referred to an excursion to the Hilmteich[1] near Graz. *The weather outside was fearful. There was a wretched hotel, water was dripping from the walls of the room, the bedclothes were damp.* (The latter part of the dream was reported less directly than I have given it.) The meaning of the dream was 'superfluous'. This abstract idea, which was present in the dream thoughts, was in the first instance given a somewhat forced twist and put into some such form as 'overflowing', 'flowing over' or 'fluid' – after which it was represented in a number of similar pictures: water outside, water on the walls inside, water in the dampness of the bedclothes – everything flowing or 'overflowing'. [1900.]

We shall not be surprised to find that, for the purpose of representation in dreams, the spelling of words is far less important than their sound, especially when we bear in mind that the same rule holds good in rhyming verse. Rank (1910*a*, 482) has recorded in detail, and analysed very fully, a girl's dream in which the dreamer described how she was walking through the fields and cutting off rich ears ['*Ähren*'] of barley and wheat. A friend of her youth came towards her, but she tried to avoid meeting him. The analysis showed that the dream was concerned with a kiss – an 'honourable kiss' ['*Kuss in Ehren*' pronounced the same as '*Ähren*', literally 'kiss in honour'].[2] In the dream itself the '*Ähren*', which had to be cut off, not pulled off, figured as ears of corn, while, condensed with '*Ehren*', they stood for a whole number of other [latent] thoughts. [1911.] [407]

On the other hand, in other cases, the course of linguistic evolution has made things very easy for dreams. For language has a whole number of words at its command which originally had a pictorial and concrete significance, but are used today in a colourless and abstract sense. All

1 [A stretch of water on the outskirts of the town.]

2 [The reference is to a German proverb: '*Einen Kuss in Ehren kann niemand verwehren*' ('No-one can refuse an honourable kiss'). The dreamer had in reality been given her first kiss as she was walking through a cornfield – a kiss among the ears of corn.]

that the dream need do is to give these words their former, full meaning or to go back a little way to an earlier phase in their development. A man had a dream, for instance, of his brother being in a *Kasten* ['box']. In the course of interpretation the *Kasten* was replaced by a *Schrank* ['cupboard' – also used abstractly for 'barrier', 'restriction']. The dream thought had been to the effect that his brother ought to restrict himself ['*sich einschränken*'] – instead of the dreamer doing so.[1] [1909.]

Another man dreamt that he climbed to the top of a mountain which commanded a quite unusually *extensive view*. Here he was identifying himself with a brother of his who was the editor of a *survey* which dealt with *far* Eastern affairs. [1911.]

In *Der Grüne Heinrich*[2] a dream is related in which a mettlesome horse was rolling about in a beautiful field of oats, each grain of which was 'a sweet almond, a raisin and a new penny piece . . . wrapped up together in red silk and tied up with a bit of pig's bristle'. The author (or dreamer) gives us an immediate interpretation of this dream picture: the horse felt agreeably tickled and called out 'Der Hafer sticht mich!'[3] [1914.]

According to Henzen [1890] dreams involving puns and turns of speech occur particularly often in the old Norse sagas, in which scarcely a dream is to be found which does not contain an ambiguity or a play upon words. [1914.]

[408] It would be a work in itself to collect these modes of representation and to classify them according to their underlying principles. [1909.] Some of these representations might almost be described as jokes, and they give one a feeling that one would never have understood them without the dreamer's help. [1911.]

(1) A man dreamt that *he was asked someone's name, but could not think of it*. He himself explained that what this meant was that 'he would never dream of such a thing'. [1911.]

(2)[4] A woman patient told me a dream in which *all the people were especially big*. 'That means', she went on, 'that the dream must be to do

1 [This instance and the next are also quoted (with somewhat different comments) in Lectures VII and VIII of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 106 and 113.]

2 [Part IV, Chapter 6, of Gottfried Keller's novel.]

3 [Literally 'The oats are pricking me', but with the idiomatic meaning of 'Prosperity has spoilt me'.]

4 [This and the two following examples were first published in a short paper, 'Nachträge zur Traumdeutung' (Freud, 1911*a*). See above, p. 322 *n*.]

with events in my early childhood, for at that time, of course, all grown-up people seemed to me enormously big.' [Cf. p. 27 *n*. above.] She herself did not appear in the content of this dream. – The fact of a dream referring to childhood may also be expressed in another way, namely by a translation of time into space. The characters and scenes are seen as though they were at a great distance, at the end of a long road, or as though they were being looked at through the wrong end of a pair of opera glasses. [1911.]

(3) A man who in his working life tended to use abstract and indefinite phraseology, though he was quite sharp-witted in general, dreamt on one occasion that *he arrived at a railway station just as a train was coming in. What then happened was that the platform moved towards the train, while the train stopped still* – an absurd reversal of what actually happens. This detail was no more than an indication that we should expect to find another reversal in the dream's content. [Cf. p. 290 f. above.] The analysis of the dream led to the patient's recollecting some picture books in which there were illustrations of men standing on their heads and walking on their hands. [1911.]

(4) Another time the same dreamer told me a short dream which was almost reminiscent of the technique of a rebus. He dreamt that *his uncle gave him a kiss in an automobile*. He went on at once to give me the interpretation, which I myself would never have guessed: namely [409]
that it meant auto-erotism. The content of this dream might have been produced as a joke in waking life.[1] [1911.]

(5) A man dreamt that *he was pulling a woman out from behind a bed*. The meaning of this was that he was giving her preference.[2] [1914.]

(6) A man dreamt that *he was an officer sitting at a table opposite the Emperor*. This meant that he was putting himself in opposition to his father. [1914.]

1 ['*Auto*' is the ordinary German word for 'motor-car'. – This dream is reported in slightly different terms in Freud's *Introductory Lectures* (1916–17*a*), Lecture XV; *RSE*, **15**, 205.]

2 [The point here is a purely verbal one, depending on the similarity of the German words for 'pulling out' ('*hervorziehen*') and 'giving preference to' ('*vorziehen*'). This dream is also quoted in Freud, *Introductory Lectures* (1916–17*a*), Lecture VII; ibid., **15**, 106. Nos. 5, 6, 8 and 9 of the present set of examples were published first in Freud (1913*h*), ibid., **13**, 185 ff.]

(7) A man dreamt that *he was treating someone for a broken limb*. The analysis showed that the broken bone ['*Knochenbruch*'] stood for a broken marriage ['*Ehebruch*', properly 'adultery'].[1] [1914.]

(8) The time of day in dreams very often stands for the age of the dreamer at some particular period in his childhood. Thus, in one dream, 'a quarter-past five in the morning' meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother. [1914.]

(9) Here is another method of representing ages in a dream. A woman dreamt that *she was walking with two little girls whose ages differed by fifteen months*. She was unable to recall any family of her acquaintance to whom this applied. She herself put forward the interpretation that the two children both represented herself and that the dream was reminding her that the two traumatic events of her childhood were separated from each other by precisely that interval. One had occurred
[410] when she was three and a half, the other when she was four and three-quarters. [1914.]

(10) It is not surprising that a person undergoing psychoanalytic treatment should often dream of it and be led to give expression in his dreams to the many thoughts and expectations to which the treatment gives rise. The imagery most frequently chosen to represent it is that of a journey, usually by motor-car, as being a modern and complicated vehicle. The speed of the car will then be used by the patient as an opportunity for giving vent to ironical comments. – If 'the unconscious', as an element in the subject's waking thoughts, has to be represented in a dream, it may be replaced very appropriately by subterranean regions. – These, where they occur *without* any reference to analytic treatment, stand for the female body or the womb. – 'Down below' in dreams often relates to the genitals, 'up above', on the contrary, to the face, mouth or breast. – Wild beasts are as a rule employed by the dream-work to represent passionate impulses of which the dreamer is afraid, whether they are his own or those of other people. (It then needs only a slight displacement for the wild beasts to come to represent the people who are possessed by these passions. We have not far to go from here to cases in which a dreaded father is represented by a beast of prey

1 [This example is also alluded to in Freud's *Introductory Lectures* (1916–17*a*), Lecture XI, where, in a footnote, a 'symptomatic act' is reported, which confirms this particular interpretation; *RSE*, **15**, 153 *n*. 2.]

or a dog or wild horse – a form of representation recalling totemism.)[1] It might be said that the wild beasts are used to represent the libido, a force dreaded by the ego and combated by means of repression. It often happens, too, that the dreamer separates off his neurosis, his 'sick personality', from himself and depicts it as an independent person. [1919.]

(11) Here is an example recorded by Hanns Sachs (1911): 'We know from Freud's *Interpretation of Dreams* that the dream-work makes use of different methods for giving a sensory form to words or phrases. If, for instance, the expression that is to be represented is an ambiguous one, the dream-work may exploit the fact by using the ambiguity as a switch-point: where one of the meanings of the word is present in the dream thoughts the other one can be introduced into the manifest dream. This was the case in the following short dream in which ingenious use was [411] made for representational purposes of appropriate impressions of the previous day. I was suffering from a cold on the "dream day", and I had therefore decided in the evening that, if I possibly could, I would avoid getting out of bed during the night. I seemed in the dream merely to be continuing what I had been doing during the day. I had been engaged in sticking press cuttings into an album and had done my best to put each one in the place where it belonged. I dreamt that *I was trying to paste a cutting into the album. But it wouldn't go on to the page* [*"er geht aber nicht auf die Seite"*], *which caused me much pain*. I woke up and became aware that the pain in the dream persisted in the form of a pain in my inside, and I was compelled to abandon the decision I had made before going to bed. My dream, in its capacity of guardian of my sleep, had given me the illusion of a fulfilment of my wish to stop in bed, by means of a plastic representation of the ambiguous phrase "*er geht aber nicht auf die Seite*" ["but he isn't going to the lavatory"].' [1914.]

We can go so far as to say that the dream-work makes use, for the purpose of giving a visual representation of the dream thoughts, of any methods within its reach, whether waking criticism regards them as legitimate or illegitimate. This lays the dream-work open to doubt and derision on the part of everyone who has only *heard* of dream interpretation but never practised it. Stekel's book, *Die Sprache des Traumes* (1911*a*), is particularly rich in examples of this kind. I have, however, avoided quoting instances from it, on account of the author's lack of

1 [See Freud, *Totem and Taboo* (1912–13*a*), Chapter IV, Section 3; *RSE*, **13**, 118 ff.]

critical judgement and of the arbitrariness of his technique, which give rise to doubts even in unprejudiced minds. [Cf. p. 313 above.] [1919.]

(12) [1914.] The following examples are taken from a paper by V. Tausk (1914) on the use of clothes and colours in dreaming.

(*a*) A. dreamt of *seeing a former governess of his in a dress of black lustre* ['*Lüster*'] *which fitted very tight across her buttocks*. – This was explained as meaning that the governess was lustful ['*lüstern*'].

(*b*) C. dreamt of *seeing a girl on the —— Road, who was bathed in white light and was wearing a white blouse*. – The dreamer had intimate relations with a Miss White for the first time on this road.

[412] (*c*) Frau D. dreamt of *seeing the eighty-year-old Viennese actor Blasel lying on a sofa in full armour* ['*in voller Rüstung*']. *He began jumping over tables and chairs, drew a dagger, looked at himself in the looking-glass and brandished the dagger in the air as though he was fighting an imaginary enemy*. – Interpretation: The dreamer suffered from a long-standing affection of the bladder ['*Blase*']. She lay on a sofa for her analysis; when she looked at herself in a looking-glass, she thought privately that in spite of her age and illness she still looked hale and hearty ['*rüstig*'].

(13) [1919.] A 'GREAT ACHIEVEMENT' IN A DREAM.– A man dreamt that *he was a pregnant woman lying in bed. He found the situation very disagreeable. He called out: 'I'd rather be . . .'* (during the analysis, after calling to mind a nurse, he completed the sentence with the words 'breaking stones'). *Behind the bed there was hanging a map, the bottom edge of which was kept stretched by a strip of wood. He tore the strip of wood down by catching hold of its two ends. It did not break across but split into two halves lengthways. This action relieved him and at the same time helped on delivery*.

Without any assistance he interpreted tearing down the strip ['*Leiste*'] as a great achievement ['*Leistung*']. He was escaping from his uncomfortable situation (in the treatment) by tearing himself out of his feminine attitude. . . . The absurd detail of the strip of wood not simply breaking but splitting lengthways was explained thus: the dreamer recalled that this combination of doubling and destroying was an allusion to castration. Dreams very often represent castration by the presence of two penis symbols as the defiant expression of an antithetical wish [cf. p. 319 above]. Incidentally, the '*Leiste*' ['groin'] is a part of the body in the neighbourhood of the genitals. The dreamer summed up the

interpretation of the dream as meaning that he had got the better of the threat of castration which had led to his adopting a feminine attitude.[1]

(14) [1919.] In an analysis which I was conducting in French a dream came up for interpretation in which I appeared as an elephant. I naturally asked the dreamer why I was represented in that form. '*Vous me trompez*' ['you are deceiving me'] was his reply ('*trompe*' = 'trunk'). [413]

The dream-work can often succeed in representing very refractory material, such as proper names, by a far-fetched use of out-of-the-way associations. In one of my dreams *old Brücke*[2] *had set me the task of making a dissection; . . . I fished something out that looked like a piece of crumpled silver paper*. (I shall return to this dream later [see p. 404 ff.].) The association to this (at which I arrived with some difficulty) was 'stanniol'.[3] I then perceived that I was thinking of the name of Stannius, the author of a [1849] dissertation on the nervous system of fish, which I had greatly admired in my youth. The first scientific task which my teacher [Brücke] set me was in fact concerned with the nervous system of a fish, Ammocoetes [Freud, 1877*a*]. It was clearly impossible to make use of the name of this fish in a picture-puzzle. [1900.]

At this point I cannot resist recording a very peculiar dream, which also deserves to be noticed as having been dreamt by a child, and which can easily be explained analytically. 'I remember having often dreamt when I was a child', said a lady, '*that God wore a paper cocked hat on his head*. I used very often to have a hat of that sort put on my head at meals, to prevent my being able to look at the other children's plates, to see how

1 [This example was first published as a separate paper (1914*e*). In reprinting it here, Freud omitted a passage, which occurred originally after the words 'by tearing himself out of his feminine attitude'. The omitted passage (which has been reprinted in *GW*, **Nachtr.**, 620) deals with Silberer's 'functional phenomenon', discussed below, on p. 450 ff. It ran as follows: 'No objection can be made to this interpretation of the patient's; but I would not describe it as "functional" simply because his dream thoughts related to his attitude in the treatment. Thoughts of that kind serve as "material" for the construction of dreams like anything else. It is hard to see why the thoughts of a person under analysis should not be concerned with his behaviour during treatment. [Cf. also p. 190 *n*. 3 above.] The distinction between "material" and "functional" phenomena in Silberer's sense is of significance only where – as was the case in Silberer's well-known self-observations as he was falling asleep [see p. 308 f. above] – there is an *alternative* between the subject's attention being directed *either* to some piece of thought content present in his mind *or* to his own actual psychical state, and not where that state itself constitutes the content of his thoughts.' Freud also remarked in parenthesis that in any case the 'absurd detail of the strip of wood not simply breaking but splitting lengthways' could not be 'functional'.]

2 [See footnote 1, p. 431 below.]

3 [Silver paper = tin foil; stanniol is a derivative of tin (stannium).]

big their helpings were. As I had heard that God was omniscient, the
[414] meaning of the dream was that I knew everything – even in spite of the hat that had been put on my head.'[1] [1909.]

The nature of the dream-work[2] and the way in which it plays about with its material, the dream thoughts, are instructively shown when we come to consider numbers and calculations that occur in dreams. Moreover, numbers in dreams are regarded superstitiously as being especially significant in regard to the future.[3] I shall therefore select a few instances of this kind from my collection.

I

Extract from a dream dreamt by a lady shortly before her treatment came to an end: *She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you doing? It only costs 21 kreuzers.'*[4] Owing to my knowledge of the dreamer's circumstances, this bit of dream was intelligible to me without any further explanation on her part. The lady came from abroad and her daughter was at school in Vienna. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The girl's school year was due to end in three weeks and this also meant the end of the lady's treatment. The day before the dream, the headmistress had asked her whether she would not consider leaving her daughter at school for another year. From this suggestion she had evidently gone on to reflect that in that case she
[415] might also continue her treatment. This was what the dream referred to. One year is equal to 365 days. The three weeks which remained both of the school year and of the treatment were equivalent to 21 days (though the hours of treatment would be less than this). The numbers, which in the dream thoughts referred to periods of time, were attached in the dream itself to sums of money – not but what there was a deeper meaning involved, for 'time is money'. 365 kreuzers amount to only

1 [This dream is also discussed in Freud, *Introductory Lectures* (1916–17*a*), Lecture VII; *RSE*, **15**, 103.]

2 [The remainder of the present section (F), with the exception of Example IV on p. 373 below, appeared in the original edition (1900).]

3 [The superstitious attitude to numbers is discussed by Freud in Chapter XII (7) of his *Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 214 ff., and in Section II of his paper on 'The "Uncanny"' (1919*h*), ibid., **17**, 231 f.]

4 [Austrian currency was denominated in florins and kreuzers at the time of the first publication of this book.]

3 florins and 65 kreuzers; and the smallness of the sums that occurred in the dream was obviously the result of wish fulfilment. The dreamer's wish reduced the cost both of the treatment and of the year's school fees.

II

The numbers which occurred in another dream involved more complicated circumstances. A lady who, though she was still young, had been married for a number of years, received news that an acquaintance of hers, Elise L., who was almost exactly her contemporary, had just become engaged. Thereupon she had the following dream. *She was at the theatre with her husband. One side of the stalls was completely empty. Her husband told her that Elise L. and her fiancé had wanted to go too, but had only been able to get bad seats – three for 1 florin* 50 *kreuzers – and of course they could not take those. She thought it would not really have done any harm if they had.*

What was the origin of the 1 florin 50 kreuzers? It came from what was in fact an indifferent event of the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a hurry to get rid of them by buying a piece of jewellery. It is to be noticed that 150 florins is a *hundred* times as much as 1 florin 50 kreuzers. Where did the *three* come from which was the number of the theatre tickets? The only connection here was that her newly engaged friend was the same number of months – *three* – her junior. The solution of the dream was arrived at with the discovery of the meaning of the empty stalls. They were an unmodified allusion to a small incident which had given her husband a good excuse for teasing her. She had planned to go to one of the plays that had been announced for the coming week and had taken the trouble to buy tickets several days ahead, and had therefore had to pay a booking fee. When they got to the theatre they found that one side of the house was almost empty. There had been *no need* [416]
for her to be in such a hurry.

Let me now put the dream thoughts in place of the dream. 'It was *absurd* to marry so early. There was *no need for me to be in such a hurry*. I see from Elise L.'s example that I should have got a husband in the end. Indeed, I should have got one *a hundred times* better' (a treasure) 'if I had only *waited*' (in antithesis to her sister-in-law's *hurry*). 'My money' (or dowry) 'could have bought *three* men just as good.'

It will be observed that the meaning and context of the numbers have been altered to a far greater extent in this dream than in the former one.

The processes of modification and distortion have gone further here; and this is to be explained by the dream thoughts in this case having to overcome a specially high degree of endopsychic resistance before they could obtain representation. Nor should we overlook the fact that there was an element of absurdity in the dream, namely the *three* seats being taken by *two* people. I will anticipate my discussion of absurdity in dreams [p. 380 ff. below] by pointing out that this absurd detail in the content of the dream was intended to represent the most strongly emphasized of the dream thoughts, viz. 'it was *absurd* to marry so early'. The absurdity which had to find a place in the dream was ingeniously supplied by the number 3, which was itself derived from a quite immaterial point of distinction between the two people under comparison – the 3 months' difference between their ages. The reduction of the actual 150 florins to 1 florin 50 corresponded to the *low value* assigned by the dreamer to her husband (or treasure), in her suppressed thoughts.[1]

III

The next example exhibits the methods of calculation employed by dreams, which have brought them into so much disrepute. A man had a dream that *he was settled in a chair at the B.s'* – a family with which he had been formerly acquainted – *and said to them: 'It was a great*
[417] *mistake your not letting me have Mali.' – 'How old are you?' he then went on to ask the girl. – 'I was born in 1882,' she replied. – 'Oh, so you're 28, then.'*

Since the dream dates from 1898 this was evidently a miscalculation, and the dreamer's inability to do sums would deserve to be compared with that of a general paralytic unless it could be explained in some other way. My patient was one of those people who, whenever they happen to catch sight of a woman, cannot let her alone in their thoughts. The patient who for some months used regularly to come next after him in my consulting room, and whom he thus ran into, was a young lady; he used constantly to make enquiries about her and was most anxious to create a good impression with her. It was she whose age he estimated at 28 years. So much by way of explanation of the result of the ostensible calculation. 1882, incidentally, was the year in which the dreamer had married. – I may add that he was unable to resist entering into

1 [This dream is more elaborately analysed at various points in Freud's *Introductory Lectures* (1916–17*a*), particularly at the end of Lecture VII and in two places in Lecture XIV; *RSE*, **15**, 107–9, 192–3 and 196–7. It and the preceding dream are also recorded in Section VII of Freud's work *On Dreams* (1901*a*), ibid., **5**, 602 f.]

conversation with the two other members of the female sex whom he came across in my house – the two maids (neither of them by any means youthful), one or other of whom used to open the door to him; he explained their lack of response as being due to their regarding him as an elderly gentleman of *settled* habits.

IV[1]

Here is another dream dealing with figures, which is characterized by the clarity of the manner in which it was determined, or rather, over-determined. I owe both the dream and its interpretation to Dr B. Dattner. 'The landlord of my block of flats, who is a police constable, dreamt that *he was on street duty*. (This was a wish fulfilment.) *An inspector came up to him, who had the number 22 followed by 62 or 26, on his collar. At any rate there were several twos on it*.

'The mere fact that in reporting the dream the dreamer broke up the number 2262 showed that its components had separate meanings. He recalled that the day before there had been some talk at the police station about the men's length of service. The occasion for it was an inspector who had retired on his pension at the age of 62. The dreamer had only served for 22 years, and it would be 2 years and 2 months before he would be eligible for a 90 per cent pension. The dream represented in the first place the fulfilment of a long-cherished wish of the dreamer's [418] to reach the rank of inspector. The superior officer with "2262" on his collar was the dreamer himself. He was on street duty – another favourite wish of his – he had served his remaining 2 years and 2 months and now, like the 62-year-old inspector, he could retire on a full pension.'[2]

When we take together these and some other examples which I shall give later [p. 400 ff. below], we may safely say that the dream-work does not in fact carry out any calculations at all, whether correctly or incorrectly; it merely throws into the *form* of a calculation numbers which are present in the dream thoughts and can serve as allusions to matter that cannot be represented in any other way. In this respect the dream-work is treating numbers as a medium for the expression of its purpose in precisely the same way as it treats any other idea, including proper

1 [This example was added in 1911.]

2 [*Footnote added* 1914:] For analyses of other dreams containing numbers, see Jung [1911], Marcinowski [1912*b*] and others. These often imply very complicated operations with numbers, which have been carried out by the dreamer with astonishing accuracy. See also Jones (1912*a*).

names and speeches that occur recognizably as verbal presentations. [See next paragraph but one.]

For the dream-work cannot actually *create* speeches. [See above, pp. 162 f. and 271.] However much speeches and conversations, whether reasonable or unreasonable in themselves, may figure in dreams, analysis invariably proves that all that the dream has done is to extract from the dream thoughts fragments of speeches which have really been made or heard. It deals with these fragments in the most arbitrary fashion. Not only does it drag them out of their context and cut them in pieces, incorporating some portions and rejecting others, but it often puts them together in a new order, so that a speech which appears in the dream to be a connected whole turns out in analysis to be composed of three or four detached fragments. In producing this new version, a dream will often abandon the meaning that the words originally had in the dream thoughts and give them a fresh one.[1] If we look closely into a speech
[419] that occurs in a dream, we shall find that it consists on the one hand of relatively clear and compact portions and on the other hand of portions which serve as connecting matter and have probably been filled in at a later stage, just as, in reading, we fill in any letters or syllables that may have been accidentally omitted. Thus speeches in dreams have a

1 [*Footnote added* 1909:] In this respect neuroses behave exactly like dreams. I know a patient one of whose symptoms is that, involuntarily and against her will, she hears – i.e. hallucinates – songs or fragments of songs, without being able to understand what part they play in her mental life. (Incidentally, she is certainly not paranoic.) Analysis has shown that, by allowing herself a certain amount of licence, she puts the text of these songs to false uses. For instance in the lines [from Agathe's aria in Weber's *Freischütz*] '*Leise, leise, Fromme Weise!*' [literally 'Softly, softly, devout melody'] the last word was taken by her unconscious as though it was spelt '*Waise*' [= 'orphan', thus making the lines read 'Softly, softly, pious orphan'], the orphan being herself. Again '*O du selige, o du fröhliche*' ['Oh thou blessèd and happy . . .'] is the opening of a Christmas carol; by not continuing the quotation to the word 'Christmastide' she turned it into a bridal song. – The same mechanism of distortion can also operate in the occurrence of an idea *unaccompanied* by hallucination. Why was it that one of my patients was pestered by the recollection of a poem that he had had to learn in his youth: '*Nächtlich am Busento lispeln . . .*' ['By night on the Busento whispering . . .' – the opening words of a well-known poem by Von Platen]? Because his imagination went no further than the first part of this quotation: '*Nächtlich am Busen*' ['By night on the bosom'].

We are familiar with the fact that this same technical trick is used by parodists. Included in a series of 'Illustrations to the German Classics' published in *Fliegende Blätter* [the comic paper] was one which illustrated Schiller's '*Siegesfest*', with the following quotation attached to it:

> Und des frisch erkämpften Weibes
> Freut sich der Atrid und strickt . . .
>
> [The conqu'ring son of Atreus sits
> At his fair captive's side and knits. . . .]

Here the quotation broke off. In the original the lines continue:

> . . . Um den Reiz des schönen Leibes
> Seine Arme hochbeglückt.
>
> [. . . His joyful and triumphant arms
> About her body's lovely charms.]

structure similar to that of breccia, in which largish blocks of various kinds of stone are cemented together by a binding medium. [Cf. p. 401 below.]

Strictly speaking, this description applies only to such speeches in dreams as possess something of the sensory quality of speech, and which are described by the dreamer himself as being speeches. Other sorts of speeches, which are not, as it were, felt by him as having been heard or [420] spoken (that is, which have no acoustic or motor accompaniments in the dream), are merely thoughts such as occur in our waking thought activity and are often carried over unmodified into our dreams. Another copious source of undifferentiated speeches of this kind, though one which it is difficult to follow up, seems to be provided by material that has been *read*. But whatever stands out markedly in dreams as a speech can be traced back to real speeches which have been spoken or heard by the dreamer.

Instances showing that speeches in dreams have this origin have already been given by me in the course of analysing dreams which I have quoted for quite other purposes. Thus, in the 'innocent' market dream reported on p. 162, the spoken words 'that's not obtainable any longer' served to identify me with the butcher, while one portion of the other speech, 'I don't recognize that; I won't take it', was actually responsible for making the dream an 'innocent' one. The dreamer, it will be remembered, having had some suggestion made to her on the previous day by her cook, had replied with the words: 'I don't recognize that; behave yourself properly!' The innocent-sounding *first* part of this speech was taken into the dream by way of allusion to its *second* part, which fitted excellently into the phantasy underlying the dream, but would at the same time have betrayed it.

Here is another example, which will serve instead of many, all of them leading to the same conclusion.

The dreamer was in a big courtyard in which some dead bodies were being burnt. 'I'm off,' he said, 'I can't bear the sight of it.' (This was not definitely a speech.) *He then met two butcher's boys. 'Well,' he asked, 'did it taste nice?' 'No,' one of them answered, 'not a bit nice' – as though it had been human flesh.*

The innocent occasion of the dream was as follows. The dreamer and his wife had paid a visit after supper to their neighbours, who were excellent people but not precisely *appetizing*. The hospitable old lady was just having her supper and had tried to *force* him (there is a phrase

with a sexual sense used jokingly among men to render this idea[1]) to
[421] taste some of it. He had declined, saying he had no appetite left: 'Get along!' she had replied, 'you can manage it', or words to that effect. He had therefore been obliged to taste it and had complimented her on it, saying: 'That was very nice.' When he was once more alone with his wife he had grumbled at his neighbour's insistence and also at the quality of the food. The thought, 'I can't bear the sight of it', which in the dream too failed to emerge as a speech in the strict sense, was an allusion to the physical charms of the lady from which the invitation had come, and it must be taken as meaning that he had no desire to look at them.

More instruction can be derived from another dream, which I shall report in this connection on account of the very distinct speech which formed its centre point, although I shall have to put off explaining it fully till I come to discuss affect in dreams [p. 411 ff. below]. I had a very clear dream. *I had gone to Brücke's laboratory at night, and, in response to a gentle knock on the door, I opened it to* (the late) *Professor Fleischl,*[2] *who came in with a number of strangers and, after exchanging a few words, sat down at his table.* This was followed by a second dream. *My friend Fl.* [Fliess] *had come to Vienna unobtrusively in July. I met him in the street in conversation with my* (deceased) *friend P.* [Paneth], *and went with them to some place where they sat opposite each other as though they were at a small table. I sat in front at its narrow end. Fl. spoke about his sister and said that in three-quarters of an hour she was dead, and added some such words as 'that was the threshold'. As P. failed to understand him,*[3] *Fl. turned to me and asked me how much I had told P. about his affairs. Whereupon, overcome by strange emotions, I tried to explain to Fl. that P. (could not understand anything at all, of course, because he) was not alive. But what I actually said – and I myself noticed the mistake – was* 'NON VIXIT.' *I then gave P. a piercing look. Under my gaze he turned pale; his form grew indistinct and his eyes a sickly blue – and finally he melted away. I was highly delighted at this and I now realized that Ernst Fleischl, too, had been no more than an apparition, a 'revenant'* ['ghost' – literally 'one who returns']*; and it seemed to me quite possible that people of that kind only existed as long as one liked and could be got rid of if someone else wished it.*

1 ['*Notzüchtigen*', 'to force sexually', 'to rape', is so used in place of '*nötigen*', 'to force' (in the ordinary sense).]

2 [See footnote 1, p. 431 below for an explanation of the persons concerned.]

3 [This detail is analysed below on p. 459.]

This fine specimen includes many of the characteristics of dreams – the [422]
fact that I exercised my critical faculties during the dream and myself noticed my mistake when I said '*Non vixit*' instead of '*Non vivit*' [that is, 'he did not live' instead of 'he is not alive'], my unconcerned dealings with people who were dead and were recognized as being dead in the dream itself, the absurdity of my final inference and the great satisfaction it gave me. This dream exhibits so many of these puzzling features, indeed, that I would give a great deal to be able to present the complete solution to its conundrums. But in point of fact I am incapable of doing so – of doing, that is to say, what I did in the dream, of sacrificing to my ambition people whom I greatly value. Any concealment, however, would destroy what I know very well to be the dream's meaning; and I shall therefore content myself, both here and in a later context [p. 429 ff. below], with selecting only a few of its elements for interpretation.

The central feature of the dream was a scene in which I annihilated P. with a look. His eyes changed to a strange and uncanny blue and he melted away. This scene was unmistakably copied from one which I had actually experienced. At the time I have in mind I had been a demonstrator at the Physiological Institute and was due to start work early in the morning. It came to Brücke's ears that I sometimes reached the students' laboratory late. One morning he turned up punctually at the hour of opening and awaited my arrival. His words were brief and to the point. But it was not they that mattered. What overwhelmed me were the terrible blue eyes with which he looked at me and by which I was reduced to nothing – just as P. was in the dream, where, to my relief, the roles were reversed. No-one who can remember the great man's eyes, which retained their striking beauty even in his old age, and who has ever seen him in anger, will find it difficult to picture the young sinner's emotions.

It was a long time, however, before I succeeded in tracing the origin of the '*Non vixit*' with which I passed judgement in the dream. But at last it occurred to me that these two words possessed their high degree of clarity in the dream, not as words heard or spoken, but as words *seen*. I then knew at once where they came from. On the pedestal of the Kaiser Josef Memorial in the Hofburg [Imperial Palace] in Vienna the following impressive words are inscribed:

Saluti patriae vixit [423]
non diu sed totus.[1]

1 ['For the well-being of his country he lived not long but wholly.' – *Footnote added* 1925:] The actual wording of the inscription is:

Saluti publicae vixit
non diu sed totus.

I extracted from this inscription just enough to fit in with a hostile train of ideas among the dream thoughts, just enough to imply that 'this fellow has no say in the matter – he isn't even alive'. And this reminded me that I had the dream only a few days after the unveiling of the memorial to Fleischl in the cloisters of the University.[1] At that time I had seen the Brücke memorial once again and must have reflected (unconsciously) with regret on the fact that the premature death of my brilliant friend P., whose whole life had been devoted to science, had robbed him of a well-merited claim to a memorial in these same precincts. Accordingly, I gave him this memorial in my dream; and, incidentally, as I remembered, his first name was Josef.[2]

By the rules of dream interpretation I was even now not entitled to pass from the *Non vixit* derived from my recollection of the Kaiser Josef Memorial to the *Non vivit* required by the sense of the dream thoughts. There must have been some other element in the dream thoughts which would help to make the transition possible. It then struck me as noticeable that in the scene in the dream there was a convergence of a hostile and an affectionate current of feeling towards my friend P., the former being on the surface and the latter concealed, but both of them being represented in the single phrase *Non vixit*. As he had deserved well of science I built him a memorial; but as he was guilty of an evil wish[3] (which was expressed at the end of the dream) I annihilated him. I noticed that this last sentence had a quite special cadence, and I must have had some model in my mind. Where was an antithesis of this sort
[424] to be found, a juxtaposition like this of two opposite reactions towards a single person, both of them claiming to be completely justified and yet not incompatible? Only in one passage in literature – but a passage which makes a profound impression on the reader: in Brutus's speech of self-justification in Shakespeare's *Julius Caesar* [Act III, Scene 2], 'As Caesar loved me, I weep for him; as he was fortunate, I rejoice at it; as he was valiant, I honour him; but, as he was ambitious, I slew him.' Were not the formal structure of these sentences and their antithetical meaning precisely the same as in the dream thought I had uncovered? Thus I had been playing the part of Brutus in the dream. If only I could find one other piece of evidence in the content of the dream to confirm this

The reason for my mistake in putting '*patriae*' for '*publicae*' has probably been rightly guessed by Wittels [1924, 86; Engl. trans. (1924), 100 f.].

1 [This ceremony took place on October 16, 1898.]

2 I may add as an example of overdetermination that my excuse for arriving too late at the laboratory lay in the fact that after working far into the night I had in the morning to cover the long distance between the *Kaiser Josef* Strasse and the Währinger Strasse.

3 [This detail is further explained below, on p. 432 f.]

surprising collateral connecting link! A possible one occurred to me. '*My friend Fl. came to Vienna in July*.' There was no basis in reality for this detail of the dream. So far as I knew, my friend Fl. had never been in Vienna in July. But the month of July was named after Julius Caesar and might therefore very well represent the allusion I wanted to the intermediate thought of my playing the part of Brutus.[1]

Strange to say, I really did once play the part of Brutus. I once acted in the scene between Brutus and Caesar from Schiller[2] before an audience of children. I was fourteen years old at the time and was acting with a nephew who was a year my senior. He had come to us on a visit from England; and he, too, was a *revenant*, for it was the playmate of my earliest years who had returned in him. Until the end of my third year we had been inseparable. We had loved each other and fought with each other; and this childhood relationship, as I have already hinted above [pp. 175 and 205], had a determining influence on all my subsequent relations with contemporaries. Since that time my nephew John has had many reincarnations which revived now one side and now another of his personality, unalterably fixed as it was in my unconscious memory. There must have been times when he treated me very badly and I must have shown courage in the face of my tyrant; for in my later years I have often been told of a short speech made by me in my own defence when my father, who was at the same time John's grandfather, had said to me accusingly: 'Why are you hitting John?' My reply – I was [425]
not yet two years old at the time – was 'I hit him 'cos he hit me'. It must have been this scene from my childhood which diverted '*Non vivit*' into '*Non vixit*', for in the language of later childhood the word for to hit is '*wichsen*' [pronounced like the English 'vixen']. The dream-work is not ashamed to make use of links such as this one. There was little basis in reality for my hostility to my friend P., who was very greatly my superior and for that reason was well fitted to appear as a new edition of my early playmate. This hostility must therefore certainly have gone back to my complicated childhood relations to John. [See further, p. 431 f. below.][3]

As I have said, I shall return to this dream later.

1 There was the further connection between 'Caesar' and 'Kaiser'.

2 [This is in fact a lyric in dialogue form recited by Karl Moor in Act IV, Scene 5, of the earlier version of Schiller's play *Die Räuber*.]

3 [Freud discusses his relations with his nephew John in a letter to Fliess of October 3, 1897. (Freud, 1950*a*, Letter 70.) A further, somewhat disguised account of an early episode, in which John and his younger sister Pauline (referred to below on p. 435) figured, is no doubt to be seen in the latter part of Freud's paper on 'Screen Memories' (1899*a*), *RSE*, **3**, 302. – The subject of speeches in dreams is also mentioned on pp. 163, 271 and 278 f. above and 416 below.]

(G)
ABSURD DREAMS – INTELLECTUAL ACTIVITY IN DREAMS[1]

[426] In the course of our dream interpretations we have so often come across the element of absurdity that we cannot postpone any longer the moment of investigating its source and significance, if it has any. For it will be remembered that the absurdity of dreams has provided those who deny the value of dreams with one of their principal arguments in favour of regarding them as the meaningless product of a reduced and fragmentary mental activity [see p. 49 ff. above].

I shall begin by giving a few examples in which the absurdity is only an apparent one and disappears as soon as the meaning of the dream is more closely examined. Here are two or three dreams which deal (by chance, as it may seem at first sight) with the dreamer's dead father.

I

This is the dream of a patient who had lost his father six years earlier. *His father had met with a grave calamity. He had been travelling by the night train, which had been derailed. The carriage seats were forced together and his head was compressed from side to side. The dreamer then saw him lying in bed with a wound over his left eyebrow which ran in a vertical direction. He was surprised at his father's having met with a calamity* (*since he was already dead*, as he added in telling me the dream). *How clear his eyes were!*

According to the ruling theory of dreams we should have to explain the content of this dream as follows. To begin with, we should suppose, while the dreamer was imagining the accident, he must have forgotten that his father had been in his grave for several years; but, as the dream proceeded, the recollection must have emerged, and led to his astonishment at his own dream while he was still asleep. Analysis teaches us, however, that it is eminently useless to look for explanations of this kind. The dreamer had commissioned a bust of his father from a sculp-
[427] tor and had seen it for the first time two days before the dream. It was this that he had thought of as a calamity. The sculptor had never seen his father and had worked from photographs. On the day immediately

1 [Henceforward, until the end of the book, it is to be assumed once more that the whole of the matter appeared in the first (1900) edition, except for passages to which a later date is specifically assigned.]

before the dream the dreamer, in his filial piety, had sent an old family servant to the studio to see whether he would form the same opinion of the marble head, namely, that it was too narrow from side to side at the temples. He now proceeded to recall from his memory the material which had gone to the construction of the dream. Whenever his father was tormented by business worries or family difficulties, he had been in the habit of pressing his hands to the sides of his forehead, as though he felt that his head was too wide and wanted to compress it. – When the patient was four years old he had been present when a pistol, which had been accidentally loaded, had been discharged and had blackened his father's eyes. ('*How clear his eyes were!*') – At the spot on his forehead at which the dream located his father's injury, a deep furrow showed during his lifetime whenever he was thoughtful or sad. The fact that this furrow was replaced in the dream by a wound led back to the second exciting cause of the dream. The dreamer had taken a photograph of his little daughter. The plate had slipped through his fingers, and when he picked it up showed a crack which ran perpendicularly down the little girl's forehead as far as her eyebrow. He could not help feeling superstitious about this, since a few days before his mother's death he had broken a photographic plate with her portrait on it.

The absurdity of this dream was thus no more than the result of a piece of carelessness in verbal expression which failed to distinguish the bust and the photograph from the actual person. We might any of us say [looking at a picture]: 'There's something wrong with Father, don't you think?' The appearance of absurdity in the dream could easily have been avoided; and if we were to judge from this single example, we should be inclined to think that the apparent absurdity had been permitted or even designed.

II

Here is another, very similar, example from a dream of my own. (I lost my father in 1896.) *After his death my father played a political part among the Magyars and brought them together politically*. Here I saw a small and indistinct picture: *a crowd of men as though they were in the* [428] *Reichstag; someone standing on one or two chairs, with other people round him. I remembered how like Garibaldi he had looked on his deathbed, and felt glad that that promise had come true*.

What could be more absurd than this? It was dreamt at a time at which the Hungarians had been driven by parliamentary *obstruction* into a

state of lawlessness and were plunged into the crisis from which they were rescued by Koloman Széll.[1] The trivial detail of the scene in the dream appearing in pictures of such a small size was not without relevance to its interpretation. Our dream thoughts are usually represented in visual pictures which appear to be more or less life-size. The picture which I saw in my dream, however, was a reproduction of a woodcut inserted in an illustrated history of Austria, which showed Maria Theresa at the Reichstag [Diet] of Pressburg in the famous episode of '*Moriamur pro rege nostro*'.[2] Like Maria Theresa in the picture, so my father stood in the dream surrounded by the crowd. But he was *standing on one or two chairs* ['chair' = '*Stuhl*']. He had *brought them together*, and was thus a presiding judge ['*Stuhlrichter*', literally 'chair judge']. (A connecting link was provided by the common [German] phrase 'we shall need no judge.') – Those of us who were standing round had in fact remarked how like Garibaldi my father looked on his deathbed. He had had a *post-mortem* rise of temperature, his cheeks had been flushed more and more deeply red. . . . As I recalled this, my thoughts involuntarily ran on:

> Und hinter ihm in wesenlosem Scheine
> Lag, was uns alle bändigt, das Gemeine.[3]

[429] These elevated thoughts prepared the way [in the analysis] for the appearance of something that was common ['*gemein*'] in another sense. My father's *post-mortem* rise of temperature corresponded to the words 'after his death' in the dream. His most severe suffering had been caused by a complete paralysis (*obstruction*) of the intestines during his last weeks. Disrespectful thoughts of all kinds followed from this. One of my contemporaries who lost his father while he was still at his secondary school – on that occasion I myself had been deeply moved and had offered to be his friend – once told me scornfully of how one of his

1 [An acute political crisis in Hungary in 1898–9 had been solved by the formation of a coalition government under Széll.]

2 ['We will die for our king!' The response of the Hungarian nobles to Maria Theresa's plea for support, after her accession in 1740, in the War of the Austrian Succession.] – I cannot remember where I read an account of a dream which was filled with unusually small figures, and the source of which turned out to be one of Jacques Callot's etchings seen by the dreamer during the day. These etchings do in fact contain a large number of very small figures. One series of them depicts the horrors of the Thirty Years' War.

3 [These lines are from the Epilogue to Schiller's 'Lied von der Glocke' written by Goethe a few months after his friend's death for the memorial ceremony on August 10, 1805. He speaks of Schiller's spirit moving forward into the eternity of truth, goodness and beauty, while 'behind him, a shadowy illusion, lay what holds us all in bondage – the things that are common'.]

female relatives had had a painful experience. Her father had fallen dead in the street and had been brought home; when his body was undressed it was found that at the moment of death, or *post mortem*, he had passed a stool ['*Stuhl*']. His daughter had been so unhappy about this that she could not prevent this ugly detail from disturbing her memory of her father. Here we have reached the wish that was embodied in this dream. 'To stand before one's children's eyes, after one's death, great and unsullied' – who would not desire this? What has become of the absurdity of the dream? Its apparent absurdity is due only to the fact that it gave a literal picture of a figure of speech which is itself perfectly legitimate and in which we habitually overlook any absurdity involved in the contradiction between its parts. In this instance, once again, it is impossible to escape an impression that the apparent absurdity is intentional and has been deliberately produced.[1]

The frequency with which dead people appear in dreams[2] and act and associate with us as though they were alive has caused unnecessary surprise and has produced some remarkable explanations which throw our lack of understanding of dreams into strong relief. Yet the explanation of these dreams is a very obvious one. It often happens that we find ourselves thinking: 'If my father were alive, what would he say to this?' Dreams are unable to express an 'if' of this kind except by representing the person concerned as present in some particular situation. Thus, for instance, a young man who had been left a large legacy by his grandfather dreamt, at a time when he was feeling self-reproaches for having spent a considerable sum of money, that his grandfather was alive again and calling him to account. And when, from our better knowledge, we protest that after all the person in question is dead, what we look upon as a criticism of the dream is in reality either a consoling thought that the dead person has not lived to witness the event, or a feeling of satisfaction that he can no longer interfere in it. [430]

There is another kind of absurdity, which occurs in dreams of dead relatives but which does not express ridicule and derision.[3] It indicates an extreme degree of repudiation, and so makes it possible to represent

1 [This dream is further discussed on p. 399 f. below.]

2 [This paragraph was added as a footnote in 1909 and included in the text in 1930.]

3 [This paragraph was added as a footnote in 1911 and included in the text in 1930. The first sentence of the paragraph implies that Freud has already explained absurdity in dreams as being due to the presence of 'ridicule and derision' in the dream thoughts. Actually he has not yet done so, and this conclusion is only explicitly stated in the paragraph below (on p. 387 f.) in which he sums up his theory of absurd dreams. It seems possible that the present paragraph, in its original footnote form, may by some oversight have been introduced here instead of at the later point.]

a repressed thought which the dreamer would prefer to regard as utterly unthinkable. It seems impossible to elucidate dreams of this kind unless one bears in mind the fact that dreams do not differentiate between what is wished and what is real. For instance, a man who had nursed his father during his last illness and had been deeply grieved by his death had the following senseless dream some time afterwards. *His father was alive once more and was talking to him in his usual way, but* (the remarkable thing was that) *he had really died, only he did not know it*. This dream only becomes intelligible if, after the words 'but he had really died', we insert 'in consequence of the dreamer's wish', and if we explain that what 'he did not know' was that the dreamer had had this wish. While he was nursing his father he had repeatedly wished his father were dead; that is to say, he had had what was actually a merciful thought that death might put an end to his sufferings. During his mourning, after his father's death, even this sympathetic wish became a subject of unconscious self-reproach, as though by means of it he had really helped to shorten the sick man's life. A stirring up of the dreamer's earliest infantile impulses against his father made it possible for this self-reproach
[431] to find expression as a dream; but the fact that the instigator of the dream and the daytime thoughts were such worlds apart was precisely what necessitated the dream's absurdity.[1]

It is true that dreams of dead people whom the dreamer has loved raise difficult problems in dream interpretation and that these cannot always be satisfactorily solved. The reason for this is to be found in the particularly strongly marked emotional ambivalence which dominates the dreamer's relation to the dead person. It very commonly happens that in dreams of this kind the dead person is treated to begin with as though he were alive, that he then suddenly turns out to be dead and that in a subsequent part of the dream he is alive once more. This has a confusing effect. It eventually occurred to me that this alternation between death and life is intended to represent *indifference* on the part of the dreamer. ('It's all the same to me whether he's alive or dead.') This indifference is, of course, not real but merely desired; it is intended to help the dreamer to repudiate his very intense and often contradictory emotional attitudes and it thus becomes a dream representation of his *ambivalence*. – In other dreams in which the dreamer associates with dead people, the following rule often helps to give us our bearings. If

1 [*Footnote added* 1911:] Cf. my paper on the two principles of mental functioning (1911*b*) [where this same dream is discussed; *RSE*, **12**, 221. – A very similar dream is analysed as No. 3 in Lecture XII of Freud's *Introductory Lectures* (1916–17*a*), ibid., **15**, 163 ff. – The next paragraph was added as a footnote in 1919 and included in the text in 1930.]
